Introduction

Throughout human history, most people have lived on the land, engaged in shepherding or farming and in a state of servitude, if not outright slavery. A series of transformations in the early modern period, particularly the growth of towns and of commerce, began to alter this historic pattern of despotic power and aristocratic domination. Political modernity largely commenced with the revolt in 1776 of the British colonists of North America, which became known as the American Revolution; and the rebellion of Louis XVI of France's subjects in 1789, which we today term the French Revolution. These very disparate events occurred in quite different circumstances and produced markedly distinct outcomes. The third great political event in this sequence, the Bolshevik Revolution of 1917, took place in turn against the background of world war and the maturing of a new revolutionary ideology, communism, and it self-consciously created yet another alternative path to modernization.

Modernity in the wider sense also encompasses two other forms of revolution. The first is the emergence of what came to be called "commercial society" in the eighteenth century, in which nations began increasingly to form an international division of labor and to trade with one another in a world market, a process we loosely term *globalization* today. The second is the industrial revolution, which, with scientific and technological innovation, dramatically increased the rate of production of goods, utterly transformed the world's system of communications, concentrated and intensified the work routines of many millions, and ultimately, with improvements in agricultural techniques, provided the nutritional, medical, and other means of sustaining and improving the quality of life for ever-increasing numbers of people. Initially, the transfer of these techniques from their origins in the more developed nations often took place through imperial conquest and colonial settlement. Here, following the Napoleonic wars, Britain dominated the world in the nineteenth century, and the great early modern empires of Spain and Portugal were largely displaced and supplanted by those of France, Belgium, Holland, Italy, Germany, Russia, the United States, and Japan.

Following World War II, many of these empires were dissolved, often by violence, though financial relationships of dependency remain in many parts of the world. The United States and (until 1991) the USSR then increasingly emerged as superpowers in world politics and performed the roles of the leading nineteenth-century empires in this period, with China joining them in the early twenty-first century.

These processes generated many of the key themes that form our starting-point in this encyclopedia—loosely the mid-eighteenth century, with the inheritance of Locke and the principles of Rousseau, particularly respecting ideas of the social contract and the necessity of government to recognise rights, rather than the earlier seventeenth century and the dominant figures of the early modern period, Thomas Hobbes and Niccolò Machiavelli, both of whom have some claims as founders of modern political thought. The British model of constitutional monarchy was hammered out from the “Glorious Revolution” of 1688 onward, to be succeeded in global influence by the American model through the late nineteenth century onward. Both forms became more democratic throughout this period, in that they extended the franchise and popular political participation, which came to include women and hitherto excluded minorities. Both became wedded to the principles we today loosely term *liberalism*, giving economic preference to free market competition and organizing politics around a multiparty system and, increasingly, public opinion. In both, the principle of divine right monarchy gave way to the natural, then human, rights of citizens, and with it to a dramatic new form of obligation of the state and society to the individual, where privileges accorded to rank were trumped by universal and equal rights, and where power flowed legitimately only from the bottom upward, not the top downward. And along the road, a new conception of a rights-based, increasingly individuated self began to emerge and to mutate.

With urbanization and improved education, a sense of the achievements of the political revolutions of the eighteenth century (and then too of their failings) came to spread with increasing speed across the globe. What Americans and some Europeans came to claim by way of rights—freedom of trade and the abolition of despotisms, slavery, and feudal privileges—became desired in other parts of the world. Yet as early as 1848, it was

evident that the tensions between political and economic modernity might provoke substantial conflict. This can be understood as the clash of two different ideals of liberty. On the banner of republican and democratic movements were the slogans of liberty, equal rights, and popular sovereignty. Rights claims are essentially here claims to equal liberties. Yet the massively increasing wealth of the property- and machine-owning few to some appeared to impose a new form of domination and exploitation no better than and in some respects worse than feudalism. Liberty of property appeared to clash with that desire by the majority for freedom of individual self-fulfillment and a decent standard of life, or freedom from want. The latter desires represent a very different account of liberty. A dominant strand of late nineteenth- and early twentieth-century thought, Social Darwinism, seemingly justified abandoning the “less fit” to their fate. But the spectacle of poverty in the midst of plenty presented a perplexing paradox by the late nineteenth century, and opposition to the concentration of wealth unmitigated by sympathy for the poor grew steadily. Welfare mechanisms began to be put in place, occasionally, as in Germany under Bismarck, to hinder socialist electoral gains, elsewhere more as a compromise between collectivist and non-interventionist groups. The twentieth century would then be dominated by the titanic struggle between the two great ideologies of modernity, liberal capitalism and (mostly Marxian) socialism, and the emergence of a multiplicity of variants within each. In response, in particular, to the Great Depression of the 1930s, capitalism proved able to adapt to the severe social strains of increasing poverty and unemployment. History failed to deliver what Marx’s prophecy of proletarian emancipation had predicted. The catastrophe of both fascist and communist totalitarianism marks a watershed in the history of dictatorial brutality and of the uglier forms of nationalism. Mindful of Marx’s own early commitment to individual freedom from oppression and alienation as well as working-class emancipation, critical and humanist schools of Marxism would scrutinise the ashes of these disasters. But no phoenix arose from them. Despite the failure of Soviet communism in the 1990s, however, in the early twenty-first century, we witness the astonishing achievements of a nation, China, in which capitalism and communism seem as nearly reconciled as may be possible, though (as one of our entries tells us) the word *modern* entered the Chinese lexicon only in 1920.

Seen from this viewpoint, then, the chief political movements and central political ideals of modernity have revolved around a revolt against privilege and servitude, against grasping landlords, knavish priests, and hereditary autocratic princes, and in favor of meritocracy and greater individual freedom. They have also often assumed the form of demands for greater liberty for communities submerged within larger and often hostile states as well as their further immersion in modern nation-states and empires. These movements have often brought with them a generalized subversion of almost every form of traditional authority, from parent to church to king to god, in the pursuit of individual autonomy. So, too, they have often provoked a fierce reaction and defense of the old order, its gods and its ways. The great modern campaigns to create and extend rights, to found responsive and responsible democratically elected governments, and then to seek beyond these social justice, all emanate from the same substantive drive toward equality that defines modernity above all else from a social viewpoint. Both the great ideologies of this period, liberalism and socialism, thus share to some degree a common source. Yet these ideals are in constant tension throughout the development of the modern period and to the present day. Monarchs have tumbled, and feudal landlords have been expropriated. But corporate CEOs have often taken their places, the concentration of wealth at times trumping democratic control over public affairs, at times falling victim to it, the omnipresent modern state sometimes serving to assist its citizens, sometimes reasserting a hegemonic mastery over them, sometimes itself a mere puppet in the hands of powerful and often corrupt financial interests.

This encyclopedia, then, introduces the key phenomena, concepts, and processes that these developments have produced, and offers a basic point of departure for students of political thought, political theory, political philosophy, and ideology. These disciplinary variants offer, of course, different starting points for entry into their subjects, different trajectories of enquiry, and different problems to solve. It is hoped that the present work, however, offers something of use to each, and the prospect of acquiring something useful in turn from the approaches of others.

Acknowledgments

Like all such works, this has been a collective enterprise from the outset. I am grateful first and foremost to my associate editors, Michael S. Cummings and Lyman Tower Sargent, for their enthusiasm and attention to detail. At Sage, Carole Maurer as senior development editor, Diana Axelsen as reference supervisor, and David Felts as production editor have performed sterling service throughout the process. Most of all, however, I would like to express my gratitude to an excellent team of contributors for their patience, fortitude, and hard work throughout the process of producing these volumes.

Abortion and Political Thought

Political and moral questions concerning abortion focus on induced abortions—the intentional termination of pregnancy—as distinguished from spontaneous abortions or miscarriages. Induced abortions may be for medical reasons (therapeutic abortions) or other reasons (elective abortions). The abortion issue is highly controversial, often involving public demonstrations supporting the right to abortion and public protests against the practice, protests sometimes escalating to violence against property and persons.

In the United Kingdom, the Abortion Act of 1967, an act of Parliament governing England, Wales, and Scotland, legalized abortion performed by trained persons on women up to their twenty-eighth week of pregnancy. In 1990, that law was amended to permit abortions only up to twenty-four weeks except in situations involving the health of the woman or the status of the fetus. In the United States, the 1973 Supreme Court decision *Roe v. Wade*, one of the most controversial decisions of the court, declared unconstitutional any state law prohibiting abortion during the first trimester of pregnancy. *Roe* permitted states to regulate abortions during the second trimester and allowed states to prohibit abortions during the third trimester except in cases where the woman's health was jeopardized or the normalcy of the fetus was an issue. *Planned Parenthood v. Casey*, a 1992 Supreme Court decision, replaced the trimester formula of *Roe* with the notion of fetal viability placed at twenty-two or twenty-three weeks. States are permitted to ban abortion after that point except in cases where abortion is

necessary to preserve the life or health of the mother. Throughout Europe and Asia, a wide variety of laws are in place, most of which legalize abortion under certain circumstances.

The moral debate over abortion is often mistakenly described as a conflict between those who oppose abortion and those who support it. The politically charged labels *pro-life* and *pro-choice* are frequently used to designate the two positions. In fact, few oppose abortion under every circumstance, and few support abortion under any circumstance. There is a continuum between the extremes of always opposing abortion and always supporting abortion, and most individuals fall somewhere between the extremes.

Typically, the most conservative moral position sees abortion as justifiable only when the woman's life is at stake, as in an ectopic pregnancy. These pregnancies usually occur in the fallopian tubes and may cause the death of the mother and fetus if not terminated. Conservatives who normally see abortion as "murder" can justify ending an ectopic pregnancy as an instance of self-defense. A less conservative position sees abortion as justified also in cases of rape or incest. This position stems in part from seeing pregnancy as a natural consequence of the choice of sexual activity—the woman (and man) should be responsible for their choices—whereas in rape and incest, the woman did not choose to engage in reproductive activity. A more liberal position considers the mental health of the woman as sometimes providing justification for abortion; some argue that preventing suicide on the part of the woman is an extension of the self-defense analogy used in the case of ectopic pregnancies. Even more liberal positions see abortion as essentially belated contraception, meaning that any reason that a woman might have for avoiding pregnancy applies: the woman's age, financial situation, life plans, unmarried state, or simply the desire not to have children. The more reasons a person accepts as justifying abortion, the more liberal his or her place on this continuum.

The pro-choice position emphasizes a woman's right to choose what occurs in her own body whenever possible. In the United States, this moral position is often seen as legally buttressed by the right to privacy, the roots of which are found in amendments to the U.S. Constitution, particularly the

Fourteenth Amendment. While pro-choice proponents may personally oppose abortion in certain circumstances, they generally accept its legality and leave the determination of particular cases to individuals. The pro-life position is typically (though not always) grounded in religious commitments, but is cast politically in terms of the rights of a human being from the moment of conception. No doubt the fetus is living and human, but is the fetus a person with rights? Or is the fetus properly characterized as only a potential person; if so, does the fetus have the same rights as the pregnant woman who is fully a person? These issues are the heart of the moral debate, although additional matters are involved. What rights, if any for example, does the biological father of the fetus have? What rights do parents of minor children have to be notified of their child's intent to have an abortion? The debate is connected to debates about feminism, sexual activity, disability, the role of religion in politics, and the role of the modern state in regulating or adjudicating moral issues.

John Noonan and Don Marquis have written frequently cited essays opposing abortion. Widely referenced essays defending the morality of abortion have been written by Judith Jarvis Thomson and Mary Anne Warren. Organizations such as the Catholic Church, Operation Rescue, Catholics for Choice, and the Alan Guttmacher Institute are sources of reading material from opposing perspectives.

Acton, John (Lord Acton)

John Emerich Edward Dalberg Acton was a British peer, historian, and correspondent. Although his direct involvement in politics was limited and he published no single, major work in any field, he was a noted historian of political thought, a major figure in European liberal Catholicism, and an influential player in the liberal movement in British politics.

Life

Acton was born in Naples, Italy, January 10, 1834, to Sir Ferdinand Richard Acton and Marie, the daughter of the Duke of Dalberg, Germany. Acton's life reflected this cosmopolitan and aristocratic background: he traveled widely, conversed fluently in the major European languages, and resided for long periods in England, Germany, and Italy alike. At age three, Acton's widowed mother remarried; his stepfather, George Leveson-Gower, would be Lord Granville, foreign minister of the Empire and political ally of William Gladstone.

Acton's great-grandfather had converted to Roman Catholicism in the eighteenth century, and the Acton line retained that religious allegiance. Thus, the boy attended Catholic boarding school in England (St. Mary's, Oscott) and developed a strong commitment to the faith of his birth parents. Religion played a vital role in his thought and in the course of his life. His application to Cambridge University was declined on account of his

Catholicism, and he went to Munich to study under the respected priest-historian Ignaz von Döllinger.

In 1854, he returned to England to accept his inheritance of the family estate at Aldenham and five years later was elected to Parliament to represent the Irish district of Carlow. In 1865, he married the daughter of Italian nobility, Marie Arco. With her, he had six children, four of them surviving to adulthood.

Acton was a passive member of Parliament, rarely speaking in debates and frequently missing votes, and his stay in electoral politics was brief. He was defeated in a bid to represent Bridgnorth, England, in 1868, and he turned his attention to writing and editing. Yet his involvement in politics introduced him to a collaborator of significant influence: future Prime Minister William Gladstone. Back in his element as an intellectual provocateur, he masterminded the production of the short-lived but influential journal of political and religious commentary, the *Rambler* (later *Home and Foreign Review*).

Acton's interest in the intersection of religion and politics led to his deep involvement, behind the scenes, in the First Vatican Council (1869–70), where he organized the ultimately unsuccessful Episcopal opposition to the declaration of papal infallibility. This action, combined with his political and personal differences with the leading British bishop of the time, Edward Cardinal Manning, led to a spirited controversy in the English Catholic world over Acton's theological orthodoxy. Acton remained a committed Catholic for the rest of his life, though he continued to criticize official policy on issues that he deemed open to debate, such as the Roman Question. (Acton opposed the pope's claim to secular authority over the Papal States, authority that had been forcibly divested in 1870 in the course of Italian unification.)

By this point, Acton was a well-known figure in European political and intellectual life. He participated in the establishment of the *English Historical Review* in 1885, and his articles published there solidified his position as one of the leading lights of the historical profession. William Gladstone had recommended him for a peerage in 1869, and Lord Acton remained Gladstone's confidant and a proponent of Liberal politics

throughout the latter's terms as prime minister. Although he never obtained a diplomatic or cabinet post as he desired, Acton was in 1892 appointed a lord-in-waiting to Queen Victoria. He relinquished that position three years later when he was nominated for the Regius Chair in Modern History at Cambridge University—a fitting personal triumph in light of his earlier exclusion—where he served as the first editor of the monumental *Cambridge Modern History*. He died June 19th, 1902, at Tegernsee, Bavaria.

Religious and Historical Views

Acton's primary intellectual concern was charting and promoting the extension of freedom in human history. While he wrote a number of quotable aphorisms concerning freedom, a precise definition of his view remains elusive. It is clear that freedom for Acton contained both negative and positive senses: the absence of constraints, but also the direction toward a good. In 1877 in "The History of Freedom in Antiquity," an address to the members of the Bridgnorth Institute, Acton stated, liberty is "the assurance that every man shall be protected in doing what he believes is his duty against the influence of authority and majorities, custom and opinion" (quoted in Fears 1988, 7); yet in 1860, Acton wrote in "The Roman Question," published in the *Rambler*, "Liberty [is] not the power of doing what we like, but the right of being able to do what we ought" (quoted in Fears 1988, 613).

As these definitions suggest, the security of the individual conscience lay at the heart of Acton's concept of freedom. "Liberty of conscience is the first of liberties," Acton insisted in the Acton Papers (quoted in Fears 1988, 504). Institutions promoted freedom by removing rather than erecting obstacles to conscientious action. Liberty, he suggested in one of his aphorisms found in the Acton Papers, is "the reign of conscience" (quoted in Fears 1988, 491).

In his lectures, "The History of Freedom in Antiquity" and "The History of Freedom in Christianity," Acton depicted history as the gradual unfolding of liberty in the face of power. Liberty was not the natural state of affairs, but had been achieved to a greater or lesser degree in various times and

places over the course of history. Acton believed that progress—the advance of liberty—could be identified, but it did not occur in a simple chronological line: “Progress is along diagonals,” as he once put it (Dalberg-Acton 1907, 489).

His admiration for the Catholic Church was in part due to his observation that the church had played a definitive role in Western history by undermining the absolute power of the state. Christianity’s rise had the dual effect of creating an institution that could counterbalance the despotic tendencies of the state and promoting a concept of the person as a holder of the rights of conscience superior to any government edict.

Yet Acton’s enthusiasm for liberty and distaste for power led him to oppose the centralization of power wherever he perceived it, including in ecclesiastical circles. Thus, the temporal power gradually acquired by the church after the time of fourth-century Roman Emperor Constantine was problematic. His fear of power as well as his reading of papal history inspired him to lead the opposition to the definition of papal infallibility at the First Vatican Council. His criticism of the abuses of power by churchmen also gave rise to his most famous saying, a correspondence between Acton and Mandell Creighton in 1887, “Power tends to corrupt and absolute power corrupts absolutely” (quoted in Fears 1988, 383).

Identifying abuses of power and discovering the conditions conducive to liberty were the formidable and important tasks of the historian. The historian’s duty, as Acton saw it, was not merely to uncover and present the facts of the past, though accuracy and honesty were essential traits. The utility of historians lay in their weighing the goodness of historical actors by applying strict standards of moral conduct. Great figures of history who used their positions to accumulate power and to exercise sway over the lives of others stood condemned at Acton’s tribunal. This explains why Acton was most severe in his judgments concerning figures such as kings, emperors, and popes: The more capacity one possessed for abusing power, the more damage one could cause. “Great men are almost always bad men,” Acton asserted to Creighton in 1887 (quoted in Fears 1988, 383).

Acton, therefore, had little patience with the historian who found mitigating factors that might excuse or even elicit sympathy for the perpetrator of

morally dubious acts: he called such a scholar the “weaker man with the sponge” who followed the “strong man with the dagger,” cleansing the reputations of history’s villains (Dalberg-Acton 2000, 80).

Yet in this as in other matters, Acton’s thought underwent development. In his early writings, Acton found reasons to explain Catholic persecution of Protestants, to justify the temporal power of the papacy, and to permit the gradual rather than immediate emancipation of slaves in the American South. On each of these issues, Acton later regretted his lack of clarity: what was evil was so always and everywhere and merited condemnation.

Increasingly unbending in both his moral stance and his tone, he alienated erstwhile collaborators such as the celebrated Catholic convert and priest John Henry Newman and his own mentor, Döllinger. Newman came to accept the doctrine of infallibility, which appeared to Acton to be an act of intellectual dishonesty. Döllinger withheld condemnation of historical actors for apparent crimes when he perceived extenuating circumstances. Both sins were unforgivable by the standards of Acton’s moral code.

Political Thought

Acton’s political outlook was a function of his religious views and historical perspective. The freedom to do one’s duty was rooted in and fulfilled by self-government in political and religious spheres. This philosophy was implicit in both Christianity and the British Constitution, and hence, the two were complementary. Because the purpose of politics was freedom—to preserve space for the exercise of conscience—religious liberty and civil liberty were inextricably connected.

Acton reserved some of his strongest criticism for those who denied religious freedom. “He that deems he can advocate the cause of religion,” he wrote in “The Count de Montalembert” in 1858, “without advocating at the same time the cause of freedom, is no better than a hypocrite and a traitor” (quoted in Fears 1988, 10). The development of religious liberty was therefore one of the great advances of civilization, and Acton gave John Locke due credit for his advocacy of toleration.

Whatever impinged on conscience was to be resisted. Thus, religious persecution was intolerable, but so were ignorance, poverty, war, and immorality. Addressing these various threats meant taking a view of government power that was not unequivocally negative. Acton favored compulsory schooling and measures to alleviate extreme inequalities in wealth. He observed that the wartime state always curtailed individual freedoms, while moral turpitude was a suppression rather than an expression of conscience.

As his concern about inequality suggests, Acton did not ignore freedom's economic dimension, and he frequently cited approvingly the work of German historical economist Wilhelm Roscher. Private property was for Acton of vital importance as a bulwark against the tendency of state dominance. Slavery, however, could not be defended, as it violated the freedom of the owned and corrupted the owner. Acton advocated both poor relief and free trade for the same reason: they enabled prosperity, which in turn encouraged liberty.

Religion, as seen above, was a vital factor in creating the context for freedom. Christianity put forward ideas vital to the advance of freedom: protection of conscience, the church-state distinction, self-government, and alleviation of poverty. Yet in Acton's sophisticated interpretation, the church was not always the vehicle for the delivery of these ideas to realization in history. They "became efficacious and masterful," he wrote in "The Puritan Revolution" in 1906, "by denying their origin" (quoted in Fears 1988, 97). Implemented under secular auspices through the political events of British, American, and French revolutions, these principles were derived first, in Acton's estimation, from religious rather than political sources.

Religion's role, however, was not merely historical. Christianity's ongoing importance lay in forming moral citizens capable of appreciating and maintaining liberty, "the delicate fruit of a mature civilization," Acton stated in his 1877 "The History of Freedom in Antiquity" (quoted in Fears 1988, 5). At the same time, the direct connection of religious and state power was a formula for tyranny of the worst sort. Acton eschewed both pagan and theocratic approaches to the relation of religion and politics.

As Acton saw it, the development of freedom in England was in his own time furthered by the liberal movement, and he therefore advocated the Liberal Party's politics in his activity and writings. At first wary of William Gladstone and doubtful of his sincerity, Acton became a devoted friend and ally, admiring him as a principled champion of liberty for such stances as his support of Irish Home Rule and for his willingness to inject moral concerns into political life. Wrapping the very prospect of humanity's progress in the fortunes of the liberal movement, Acton invested politics with heavy moral significance. He seemed to sense that he took politics too seriously: "Politics comes nearer religion with me," Acton wrote to Mary Gladstone in 1884, "a party is more like a church" (quoted in Hill 2000, 170).

Acton's liberalism put him in a position at once appreciative and critical toward the chief figure in British conservatism, Edmund Burke. He praised Burke's defense of conscience and property, but deemed his attachment to tradition to be dangerously conservative. He thought Burke's deference to custom and circumstance compromised the moral principles that were a surer guide to judgment in history and politics.

Given his focus on the threat of power, Acton was naturally inclined toward governmental systems that contained checks and balances. He viewed the British model of constitutional monarchy as deserving the highest praise, though he eventually came to admire equally American republicanism. Initially skeptical of the governmental system of the United States, he feared that it placed too much faith in the people, raising inadequate safeguards in the form of constitutional limits. Democracy presented as many problems as monarchy, he thought: the majority might easily be persuaded by fleeting concerns to approve measures restrictive of freedom.

Yet Acton came to regard the American system as a work of genius, federalism being the key to its success. The federal arrangement diminished the threat of popular tyranny by diffusing power among the states. Federalism, he believed, was "the one immortal tribute of America to political science," at once the "consummation and the guard of democracy" (Dalberg-Acton 2000, 31).

For some fifty years after his death, Acton remained relatively obscure, a fact attributable to reasons of intellectual and political climate as well as the paucity of easily accessible materials. (Acton's considerable intellectual legacy was contained in large measure in published essays scattered in defunct journals and in correspondence rather than in published monographs.) In the post–World War II era, Acton's stature steadily grew as increasing attention was paid to the themes on which Acton concentrated: the dangers of state power and the relation between morality and politics. Admirers focused on the Cambridge professor's apparently prescient criticism of the ideologies of the twentieth century. Acton looked dimly upon the increasingly popular notion of nationality, for example, scoring it in "Nationality," published in 1862 in *The Home and Foreign Review*, as a "retrograde step in history" (quoted in Fears 1988, 432).

Acton's rehabilitation was facilitated by the ongoing collection, editing, and releasing of his essays, notes, and correspondence. By the late twentieth century, he was recognized by some as a major figure in the pantheon of liberal thinkers that included Locke, John Stuart Mill, and Thomas Hobbes. The major piece lacking in Acton scholarship—an oft-called-for full-length biography—finally appeared in 2000.

Given his emphasis on the corrupting effect of power, libertarians have naturally invoked Acton as an ally in contemporary debates, and proponents of limited government have most consistently and enthusiastically promoted his thought. Yet his religious views, his explicit critique of laissez-faire economics, and his recognition of the state's role in supporting morality, education, and economic equality has rendered his legacy too complex and his intellectual appeal too diverse to be appropriated by a single political constituency.

Adams, John

In the late eighteenth century, John Adams (1735–1826) participated in the colonial American struggle against British imperial authority, the movement for American independence, and the establishment of republican government in the United States. His political thought and leadership played a crucial role in transforming thirteen of Britain's mainland North American colonies into a republic. Historians typically recognize two phases in the development of Adams's thought. First, during the period of resistance to Great Britain, Adams's major writings on liberty such as *A Dissertation on the Canon and the Feudal Law* (1765) and *Novanglus* (1775) gained for him a reputation as a defender of colonial rights. Second, by the 1780s, Adams shifted his attention away from abstract questions about liberty toward a consideration of good governance in his *Thoughts on Government* (1776), *A Defence of the Constitutions*, and *Discourses on Davila* (1790). For Adams, the critical problem that emerged from the American Revolution concerned finding the proper balance between preserving the people's liberty and securing the social and political order.

A descendent of the Puritans, Adams was born on his family's farm in Braintree, Massachusetts, in 1735. His family possessed neither wealth nor social standing. Despite the lack of family connections, Adams attended Harvard College. His father, who wanted Adams to enter the ministry, sold a portion of farmland to provide for his son's education. At Harvard, Adams's learning took a secular turn. He became more interested in natural philosophy through reading the works of John Locke, Francis Bacon, and

Isaac Newton than in the theological controversies with which New England ministers traditionally occupied themselves. In 1756, within one year of his graduation, Adams began his legal studies. Under the guidance of Judge James Putnam of Worcester, Massachusetts, Adams undertook an extensive reading program of both classical and modern law books to prepare for the profession; he invariably brought this education in law and constitutionalism to bear on his subsequent political thought.

As Adams began to build his legal practice in the mid-1760s, Great Britain launched a series of administrative reforms aimed at making its empire more profitable and efficient. These reforms entailed new regulations and taxes on the colonists. After Parliament passed the Stamp Act, which placed a tax on all printed materials and legal documents in the colonies, widespread denunciations of the tax emerged. This imperial crisis pushed Adams to think more deeply about the foundation of liberty in New England. In 1765, he published *A Dissertation on the Canon and Feudal Law*. That work stressed the unconstitutionality of Britain's attempt to tax the colonies without their representation in Parliament. To Adams, the Stamp Act, combined with Britain's attempt to establish Anglicanism and episcopacy in New England, represented a conspiracy to enslave the colonies.

Published as a series of articles in *The Boston Gazette*, Adams's *Dissertation* depicted the Anglo-American past as a struggle between liberty and tyranny. Drawing on the anti-Catholicism that animated colonial New England, he asserted that the worst tyranny in history had been "the wicked confederacy" between the canon and feudal law invented by Roman Catholic priests for the enlargement of their own powers. However, since the Protestant Reformation, the English people had become determined to secure their rights. In seventeenth-century England, the Stuart dynasty attempted to resurrect that confederacy between religious and political authority, but these attempts gave rise to a Puritan opposition. According to this interpretation, the Puritans had founded New England as a refuge from civil and ecclesiastical tyranny. In opposing Parliament's unconstitutional taxes, Adams asserted that the colonists must revive the spirit of resistance displayed by their Puritan ancestors. Although Adams largely rejected the

theological underpinnings of Calvinism, Puritan precedents continued to guide his understanding of liberty.

After serving in the Massachusetts House of Representatives, defending the British soldiers accused of murdering civilians during the Boston Massacre, and participating in the First Continental Congress, Adams published his next major work, *Novanglus: Or, A History of the Dispute with America from Its Origin, in 1754, to the Present Time*. Published during another imperial crisis, these essays appeared as a series in *The Boston Gazette* in early 1775. One year previously, Parliament had passed the Coercive Acts, which closed Boston's port, appointed a military governor for Massachusetts, and suspended that colony's assembly. These measures aimed to stamp out the resistance movement in Boston and to cut off New England from the rest of the colonies. *Novanglus* used both natural law and historical precedents to deny Parliament's authority over the colonies. In effect, Adams's revolutionary argument denied the Whig theory of Parliamentary supremacy that had dominated British political thought after the Glorious Revolution (1688–89). Instead, he argued that the provincial assemblies governed the colonies and that their authority derived from a grant by the king.

In *Novanglus*, Adams further denounced the “dark intrigues and wicked machinations” of the “Tory” supporters of Parliament who sought to expand the powers of the imperial government at the expense of the colonists' liberties. Specifically, he attacked the junto of Thomas Hutchinson, Andrew Oliver, and Francis Bernard. These colonial officials, Adams believed, monopolized public offices in the colonies. Through multiple appointments, these men dangerously blurred the executive, legislative, and judicial powers. This violation of the principle of separation of powers posed a threat to colonial liberties. Adams appealed to “revolution principles,” which he defined as “the principles of Aristotle and Plato, of Livy and Cicero, and Sidney, Harrington, and Locke,” as the foundation of government. These revolution principles, he argued, ultimately justified resistance to tyranny. Still, maintaining his allegiance to the monarchy, Adams in *Novanglus* confined his criticism of British authority to Parliament and colonial officials.

As imperial government began to collapse in America (1775–76), John Adams encouraged the states to replace their colonial governments with new republican constitutions. He collected his advice on the formation of republican constitutions in *Thoughts on Government: Applicable to the Present State of the American Colonies*. Published in 1776, this pamphlet represented Adams's strongest statement of political principles as well as his most influential work to date. In this work, Adams offers one of his early statements of his devotion to mixed government. Adams believed that a mixed constitution or balanced government, modeled on that of Great Britain, secured liberty and order. By dividing power among the King, Lords, and Commons, the British constitution distributed power respectively among the three Aristotelian orders: the one (monarchy), the few (aristocracy), and the many (democracy). If any one of these three political bodies acquired too much power, a constitution grew corrupt. Building on this British model, Adams believed that powers should be distributed in a republic between the few (an aristocracy based not on birth but on merit) and the many (a virtuous citizenry). Adams developed this theme at greater length in the 1780s.

In 1780, Adams put his thoughts on republican government into practice when he drafted the Massachusetts state constitution. Unlike other state constitutions that had deviated from the British model, the Massachusetts constitution reflected Adams's belief in balanced government by establishing a bicameral legislature, an independent judiciary, and a strong executive with a veto power over legislation. This constitution subsequently became the model for other state constitutions as well as for the Federal Constitution. During the Constitutional Convention (1787), Adams remained in Europe on a diplomatic mission. Although he did not participate in that convention, he influenced its proceedings because many delegates used Adams's *Defence of the Constitutions of Government of the United States of America* as a reference work during their deliberations.

Published in January 1787, Adams's *Defence* responded to Europeans who argued that several American state constitutions, such as those of Massachusetts, Maryland, and New York, slavishly followed the British model of mixed government. These critics contended that all power must reside in the democratic order, an undivided popular assembly or a

unicameral legislature. Therefore, in his *Defence*, Adams sought to explain the ideas and values that produced the American constitutions. In three volumes, Adams surveyed the history of republics, both ancient and modern, to demonstrate the right thinking of the Americans in establishing mixed constitutions. To do so, Adams quoted—often in large block passages—from a diverse range of authoritative texts that included Niccolò Machiavelli, James Harrington, Algernon Sidney, Charles Baron de Montesquieu, Plato, John Milton, and David Hume. Through its deep learning, the *Defence* became Adams’s masterwork of political thought. In *Discourses on Davila*, published as a series in the *Gazette of the United States* in 1790–91, Adams continued the line of inquiry that he had begun in the *Defence*. He particularly addressed the challenge that the French Revolution posed to American constitutionalism, warning Americans against the democratic excesses of the French Revolution that placed too much power in the hands of the many. At the same time, Adams feared elite dominance in America. For Adams, a mixed constitution was the only way to balance the interests of the few against those of the many.

Through the imperial and constitutional debates of the late eighteenth century, Adams honed his political, legal, and constitutional thought by writing numerous newspaper articles, pamphlets, and books. These works reveal his devotion to certain fundamental principles of good government: the separation of powers, bicameral legislatures, independent executives, and an independent judiciary. Above all, he valued a mixed constitution as the strongest guard against corruption. His political thought also demonstrated a practical bent. Adams formulated his ideas in response to specific crises and problems that Americans faced during that age of revolution and constitution making. Ultimately, Adams’s writings on freedom and governance place him alongside Thomas Jefferson and James Madison as one of the foremost political thinkers of the revolutionary generation.

Affirmative Action

Affirmative Action

Affirmative action denotes policies and practices that promote the rise of ethnic, gender, or racial groups in an effort to enhance equal opportunity in areas of life such as education and employment. It seeks to compensate for past discriminations and to urge or require positive actions to increase diversity in colleges and universities, the workplace, and elsewhere.

Although the concept has probably been applied most widely and has become most controversial in the United States of America, it also exists in other nations.

Origins of Affirmative Action in the United States

In the United States, the modern origin of affirmative action is traced to an executive order by President John F. Kennedy in 1961. However, the most explicit use of the term and its most forceful enforcement were begun by President Lyndon B. Johnson in 1965. Following the signing of the Civil Rights Act of 1964 and the Voting Rights Act of 1965, Johnson delivered a major speech on June 4, 1965, in which he gave his definition of affirmative action. He said that the struggle for civil rights had entered its “next and profound stage” and that “we seek . . . not just equality as a right and a theory, but equality as a fact and as a result.” He noted that despite the advances of the Civil Rights Movement, African Americans, especially, still suffered from the vestiges of past and continuing racial discrimination and thus were still crippled in their quest for equality. Therefore, it was

necessary to give them a helping hand or a leg up so as to ensure equal opportunities in education, employment, and other walks of life. Yet to avoid charges of favoritism, Johnson said affirmative action programs would be temporary rather than permanent and that they would no longer be needed once “a level playing field” had been achieved for all American citizens. Then, in September 24, 1965, Johnson signed Executive Order No. 11246 on affirmative action, including provisions for enforcement.

In the period immediately after Johnson acted, affirmative action was widely applauded or grudgingly accepted, while outright vocal opposition was minimal. Most Americans in this era of civil rights seemed to acknowledge the fairness of the concept, particularly its compensatory and temporary features.

Although Democratic presidents initiated executive orders for affirmative action in the 1960s, winning widespread support from many in their party outside of the white South, Republicans generally opposed the policy. But with the prodding of African American Assistant Secretary of Labor Arthur Fletcher, Republican President Richard M. Nixon issued an executive order in 1969 requiring goals and timetables for the employment of blacks in the construction industry in Philadelphia, Pennsylvania. Nixon explained that although he was not imposing quotas, the Philadelphia order was necessary because both the construction industry and the craft unions in that city had been egregiously and openly hostile to fair employment for blacks.

But soon a backlash developed and was partially endorsed by Republican officeholders and other conservative spokespersons. Increasingly, white males particularly claimed that affirmative action programs were denying qualified or more qualified whites placed in jobs and in colleges and universities in favor of less qualified African Americans.

Backlash and Defense

By the 1970s, some of those who claimed to be victims of reverse discrimination on account of race began to file lawsuits. In 1977, in the first major U.S. Supreme Court case on the issue, *Regents of the University of California v. Bakke*, Bakke had applied for admission to the medical school

of the University of California at Davis. On two occasions, his applications for admission had been denied solely on the basis that he was a white male. He pointed out that less qualified minority applicants had been admitted under the university's separate admissions program for minorities, in which sixteen out of a hundred places had been reserved for them. A divided Supreme Court ordered Bakke admitted and struck down the medical school's "inflexible quota systems." But it upheld the legality of affirmative action without quotas.

While anti-affirmative action forces took some comfort in the admission of Bakke and the elimination of quotas, they continued to rail against the legality and fairness of affirmative action. They argued that race-based policies and practices had no place in the American constitutional system, as the Civil Rights Movements had demonstrated. Although many had been opposed to the Martin Luther King Jr.-led Civil Rights Movement, they began to use King's own words to affirm a requirement for "a color-blind society." They contended that, as a nation of immigrants, many American ethnicities had faced disadvantages, but through hard work and perseverance had "pulled themselves up by their bootstraps." They suggested that biological and socially pathological differences were at the root of the inabilities of blacks, particularly, to advance without "preferential treatment." Rather than using initiative and responsibility to climb the ladder to success, the critics charged, African Americans opted for handouts and free rides, preferring to play the role of victims to institutionalized white racism.

Proponents of affirmative action, while not always supportive of the Supreme Court's position on quotas in the *Bakke* case, were delighted that the Court had sanctioned affirmative action. Although many of them remained convinced that the setting of representative goals to redress previous and continuing discriminations could best serve national interests, they consoled themselves that much of this could still be achieved voluntarily rather than being compulsory as long as affirmative action, generally, was still the law of the land. But they often found themselves on the defensive as anti-affirmative action individuals, in and out of government, employed essays and treatises, oratory, the media, and lower courts in their backlash.

The pro-affirmative action individuals and groups countered with their own rhetoric, treatises, and media appearances. Among other things, they argued that the comparisons of African Americans with other ethnic immigrants were unfair. In the first place, African Americans had not been voluntary immigrants seeking a better life, but had been brought to American shores in chains. Then, they endured more than two centuries of bondage, followed by nearly another century of second-class citizenship, marked by segregation, discrimination, exploitation, and dehumanization. Although they agreed that affirmative action measures should be temporary, it would take much longer for disadvantaged minorities to reach the requisite even playing field, particularly with white males.

Complicating the affirmative action debate was the entrance of African American neoconservatives, some of whom had been recipients of affirmative action. These individuals opined that affirmative action programs demeaned blacks by suggesting that they could not compete with whites for jobs and for college and university admissions without favoritism. Adopting some of the same individualist arguments of white conservatives, they blamed social pathologies for the disadvantages that blacks exhibited. They also often cited a long list of black achievers who had succeeded in American society without preferential treatment. One such neoconservative was Clarence Thomas, who served as Chairman of the Equal Employment Opportunity Commission under Presidents Ronald Reagan and George H. W. Bush from 1982 to 1990. In 1991, Bush appointed Thomas to the Supreme Court in 1991, where he played a role in the Court's increasing intervention in this area.

Supreme Court Rulings Narrow Affirmative Action's Scope

Although the U.S. public debate over affirmative action has been long and often bitter and divisive, both sides agree that the ultimate resolution of the matter will be in the U.S. Supreme Court. Since *Bakke*, the Court has heard several cases involving the issue. In these, including *Fullilove v. Klutznick* (1980), *Wygant v. Jackson Board of Education* (1986), *City of Richmond v. Crown* (1995), and *Hopwood v. University of Texas Law School* (1996), the

Court has narrowed the application of affirmative action programs. In addition to consistently ruling against quotas, the Court has limited relief to minorities and women in affirmative action cases to specified periods of past and direct discrimination. Then, in 2003, in *Gratz v. Bollinger* and *Grutter v. Bollinger*, the high court seemed to move away from the affirmative action dictum of compensatory relief for past discrimination.

Both of the landmark cases involved the University of Michigan. The issue in *Gratz* stemmed from the undergraduate school's use of an admissions policy that rates applicants numerically, with additional points being awarded to minorities. In *Grutter*, the university's law school had used an individualized process for admissions. In a five to four ruling, the Supreme Court decided in *Gratz* that the University of Michigan's undergraduate school had not narrowly tailored its use of race in undergraduate admissions in accordance with the "individualized consideration" formula that the Court had previously approved for affirmative action admissions; thus, the policy was unconstitutional. On the other hand, in a six to three decision in *Grutter*, the Court ruled that the Michigan Law School had used an "individualized consideration" formula in which race was only one of several factors determining an applicant's qualifications for admission; thus, the law school's policy was acceptable.

The Michigan cases, although producing different practical results, upheld the concept of affirmative action as long as race was only one of several factors considered for admissions. The Court justified its ruling in *Grutter* on the basis that a consideration of race furthered a compelling national interest "in obtaining the educational benefits that flow from a diverse student body." Writing for the majority, Justice Sandra Day O'Connor wrote in *Grutter*, "In order to cultivate a set of leaders with legitimacy in the eyes of the citizenry, it is necessary that the path to leadership be visibly open to talented and qualified individuals of every race and ethnicity." Thus, on the thread of diversity, affirmative action in college and university admissions survived for another day. However, the Court made it clear that the policy was still considered a temporary one and that its termination could be forecast in the two or three decades.

During these periods, the Court made only two major decisions where quotas were permitted. In *Fullilove v. Klutznick* (1980), the Court allowed a modest quota of 10 percent of congressional appropriations for public works to be set aside for qualified minority contractors. The Court reasoned that the quota was narrowly focused and limited and was not strict and inflexible. Then, in 1987, in *United States v. Paradise*, the Court allowed a plan to place at least 25 percent of blacks in the Alabama Department of Public Safety because that state had consistently and overtly defied efforts to desegregate the Alabama State Patrol.

Meanwhile, outside the courts, individual states were taking decisive actions against affirmative action. These included several ballot initiatives: Proposition 209 in California (1997), Initiative 200 in the state of Washington (1998), and Initiative 424 in Nebraska (2008). However, Amendment 46, a ban on affirmative action, failed in Colorado in 2008. The legislature of Florida effectively ended affirmative action in that state in 2000.

With the election of the first African American, Barack Obama, to the presidency in 2008, new questions arose as to the necessity and viability of affirmative action in the United States of America. Obama, while endorsing the continuation of the policy, suggested that it might in the future be more applicable to disadvantages of class rather than of race. He cited the examples of his two daughters who did not need any helping hand to succeed in society, while other Americans, disadvantaged by their station in life, regardless of race or ethnicity, might need some uplift. Thus, it does seem that in the United States of America, socially and politically, time is running out for affirmative action as we have known it.

Affirmative Action Across the Globe

Yet in the rest of the world, several affirmative action programs exist and for the most part, their continuation does not seem to be imminently threatened. For example in Brazil, compensatory and preferential admissions to some universities are available to racial minorities. Canada has an affirmative action program for women, the disabled, aboriginal people, and visible minorities. China has preferential policies for top jobs in

government for ethnic minorities and women and for ethnic minorities' admissions to universities. South Africa provides for economic equality in the workplace by advancing people with disabilities, people from rural areas, white women, and all people of color. India has caste-based quotas in education and government employment and in university admissions. In New Zealand, preferential policies have been used to provide greater university access for Maori and other persons of Polynesian descent.

African Political Thought

Modern African political thought began in the eighteenth century as a global response by Africans, on the continent and in the African diaspora, to the transatlantic slave trade and to slavery. They protested the brutality of slavery and struggled to end it. From this beginning, the course of African political thought focused primarily on arguments made in defense of the human rights of Africans. Theories were developed to justify emerging movements of discontent that directly challenged slavery, racism, colonialism, and underdevelopment in postindependent Africa. Often, these theories were expressed in literature, memoirs, popular culture, and music, as well as in speeches and more traditional political documents.

African Abolitionism, Nationalism, and Negritude

Africans forced into slavery reflected on their new situation and reacted to the gross injustices perpetrated against them in the name of a Western civilizing mission by developing African abolitionism, a series of arguments written to assert the humanity of Africans and the urgent need to end slavery by describing the dehumanizing effects of slavery upon the enslaved and slave owners. The autobiographical slave narrative *The Interesting Narrative of the Life of Olaudah Equiano, or Gustavus Vassa, The African* is the best-known example of this development of African

protest literature. Published in 1789, this work was widely read and became an important weapon of the abolitionist movement. Equiano was the first to create an identity that was pan-African or continental in scope, and it included a commitment to activism for the rights of all Africans in Africa, Europe, and the New World. Recent scholarship indicates that Equiano might have been born in the New World. This possibility, as well as the contents of his narrative, underscores the complex interplay of ideas between Africans who lived on the continent and those who lived in the African diaspora. The influence of African abolitionism continued to dominate the thinking of nineteenth- and twentieth-century African writers generally and can be seen in the later writings of such activists as C. L. R. James (1901–1989), Eric Williams (1911–81), and George Padmore (1903–59).

Ideas of cultural nationalism and negritude developed in the nineteenth and early twentieth centuries as preludes to the movements for independence from colonialism that later were formulated as theories of African nationalism. The right to respect the differences of the Negro race in terms of its culture, traditions, and its essence was demanded by intellectuals who found wanting the indirect rule of the British as well as the assimilationist policies of the French and Portuguese in Africa. The European powers weakly disguised their feeling of racial superiority and demanded a right to continue to rule over Africans who were “unripe for independence.” The African movement in British West Africa calling for African clergy to run independent churches and the demands for control over educational institutions eventually led to demands for a greater role in the governing colonial legislative councils. The educated elite wanted Africans to be trained by Africans with an African outlook and demanded the early foundation of a West African university. Men such as Edward Wilmot Blyden (1832–1912), John Mensah-Sarbah (1864–1910), and J. E. Casely Hayford (1866–1930) championed the pan-African cause of an Ethiopia that would be unbound and free to develop along natural lines.

While Aimé Césaire (1913–2008) from Martinique was the first author to use the term *negritude*, many others continued to develop this idea into a full-fledged philosophy of a mode of being that distinguished the black African from the European or the Asian. In the 1930s, African and West

Indian students studying in France contested the colonial order by focusing on the essential identity of the black race. Despite their references to physical features supposedly common to blacks, their concept of race was not biological but cultural. They challenged the claims about universality of French culture and juxtaposed it to a culture that represented the collective consciousness of blacks in Africa and in the diaspora. Negritude was not based on a mere description of the character of blacks but on the amalgam of influences stemming from geography, history, and ethnicity that created a collective soul. Léopold Sedar Senghor (1906–2001) became the greatest explicator of negritude. He defined this theory as the sum total of the cultural values of Africa. Although blacks used reason, their version was imbued with emotion, their dominant trait. The logical intelligence of the European lacked the sensuous nature and spiritual component of the African outlook. In Senghor's mind, negritude spawned a version of African nationalism and socialism. However, steeped in the artistic expression of traditional African culture, it appeared as a conservative return to the past rather than as an effective political rallying call. Nevertheless, negritude represented to Senghor an expression of the self-reflection of the black man that was necessary at the time to overcome the demoralizing effects of colonialism. These ideas in the philosophy of negritude were often expressed in poetry and literature and were to influence many philosophers and activists for decades.

Black Consciousness and Colonialism

The notion of an African human nature was subsequently elaborated upon by others, including Steve Biko (1946–1977), who was beaten to death by the South African police. Biko spoke to the psychological impact of colonialism on the colonized in South Africa. His philosophy of black consciousness attacked the apartheid equation of blackness as identical with inferiority. Instead, Biko defined blackness as a mental attitude that should be embraced and used to create solidarity among the oppressed. To be able to imagine a free self was the first step toward liberation, although black consciousness was more than a means to an end. The necessity of beginning with a change in consciousness was made essential by the specific form of colonization suffered by Africans in South Africa. There, the contact between Africans and Europeans had been between two unequal parties; the

European culture had become dominant and the African culture had been destroyed and twisted, and ideas of inferiority had become deeply embedded in Africans' own sense of self-worth. Thus, freedom for Africans had to include a black consciousness that rejected Western values and promoted another, African, set of beliefs that placed humans at the center of society.

Theories of decolonization began to emerge well before the end of the colonial period of the mid-twentieth century. These early stirrings of nationalism in Africa expressed the desire for self-determination along three trajectories: one, independence for already-existing traditional ethnic groups; two, for territorial entities created by the colonialists; or three, a single continentwide unity envisioned in racial terms that included a return to Africa of those in the diaspora.

The first argument is exemplified in the writings of James Africanus Beale Horton (1835–83), who used his medical knowledge to refute arguments of the biological inferiority of Africans. In his book *West African Countries and Peoples* (1865), he took equality as his starting point and argued that Africans could develop their traditional ethnic units into independent modern nation-states. Decades later, Obafemi Awolowo (1909–87) of Nigeria's Action Group continued in this vein, advocating regional autonomy within an independent Nigeria based on a federal rather than on unitary structure. The third argument, the pan-African option, was widely considered more inspirational than practical as its most prominent supporter, Kwame Nkrumah (1909–72), led the progressive crusade for continental unity. More cautious African nationalists, who were more moderate and less revolutionary, would only accept a loose confederation of independent nation-states. The institutional expression of pan-Africanism, the Organization of African Unity, established in 1963 in Addis Ababa, Ethiopia, was based upon the second argument of accepting the colonial boundaries for independent African countries. Indeed, history shows that the winning approach was to fight for independence on the basis of the existing colonial territories. African nationalism was a movement of the majority within each separate colony that fought a successful campaign to eliminate colonial control.

The Era of Independence

The independence of African countries ushered in a new era for African political theorists. Leaders, swept into power by majorities of Africans, defended their victory over foreign minorities as the triumph of a return to democracy against colonial dictatorships. To many Africans, the foundation of modern democracy was seen as a return of African control over African affairs. This idea stressed participation and mobilization of the masses. It also included an emphasis on ends rather than on means. So long as the leaders ruled in the interests of the African peoples rather than in the interest of the colonial powers, all that was necessary was, as was often said, “talking till you agree.” There was no need for a formal opposition or competing political parties. One party rule was justified by many as the democratic will of the African peoples who had voted overwhelmingly for a single party to end colonial rule.

Some newly elected heads of state rejected capitalism and embraced socialism as the road to economic development. This decision took place at the height of the Cold War period when most African countries won their independence and their leaders were forced to choose allies in the international system. Some, however, declared that a Third Way must be found. Nonalignment and socialism with an African twist was their answer. Julius Nyerere (1922–99), the first president of independent Tanganyika, later known as Tanzania after it merged with Zanzibar, was the most prominent theorist of this strand of thinking about development. Nyerere conceived of African socialism (*ujamaa* in Swahili) as a system based on traditional African values where all members of a community had equal rights and opportunities, no one was exploited, and everyone did his or her fair share of work. He proposed collectivized agriculture and the nationalization of other sectors of the economy. This proposal was done with the expectation that productivity would rise and the material needs of everyone in the society, especially in the rural areas, would be met before any individual would live in luxury.

A slightly different version of socialism was developed in Egypt after it won its independence in 1952. Gamal Abdel Nasser (1918–70) exerted a great deal of influence in North Africa and in the Middle East as he

attempted to implement a theory of Arab socialism that had much in common with Nyerere's ideas of African socialism. Nasser was one of the founders of the non-aligned movement along with Jawaharlal Nehru (1889–1964) of India and Josip Broz Tito (1892–1980) of Yugoslavia. The 1955 Bandung Conference on Non-Alignment held in Bandung, Indonesia, promoted the national development of former colonies around the world. Leaders of twenty-nine independent states in Africa and Asia attended the conference. Nasser used his idea of three mutually reinforcing Arab, African, and Muslim concentric circles to theorize on the role of Egypt in international affairs. He saw Egyptians as the guardians of the continent's northern gate, constituting the connecting link with the outer world and attempted to unify the African, Arab, and Muslim world for development purposes.

Nkrumah, the first African to lead Ghana after the end of colonialism, came to prefer the term *scientific socialism in Africa* and ultimately argued for class struggle on an international scale. While Nkrumah's early work *Consciencism* saw traditional African societies as classless, the neocolonial period saw the emergence of such divisions as an extension of class struggles occurring in Western industrial societies. After gaining and losing the political kingdom in a military coup, Nkrumah developed a full-blown theory of neocolonialism in his book *Neocolonialism: The Highest Stage of Imperialism* that recognized the continued domination of the former colonial powers in economic terms.

Frantz Fanon (1925–61) and Amilcar Cabral (1924–73) developed theories of liberation and revolution that were critical of the early nationalists. Fanon trained as a psychiatrist and practiced in Algeria under French rule. Cabral was an agronomist from Guinea Bissau, West Africa. Their respective disciplines were used as frameworks to create a new approach to liberation theories. The Marxist concept of class was revised so that it could help analyze African populations and determine their role in the struggle for true liberation. Fanon felt strongly that the spontaneous violence of the peasants must be directed by a new wave of intellectuals for liberation to take place in the psyche of the formerly colonized. Cabral organized urban sympathizers to educate and lead the more egalitarian peasants in the revolutionary struggle to take back control over the national productive

forces and hence their history. However, victory for the nationalist parties only resulted in neocolonial puppets ruling in the interests of their former colonial masters. Liberation could not take place unless the inheritors of the revolutionary state, the petty bourgeoisie, continued the revolutionary movement for change by committing what Cabral called class suicide. Without this transformation, the rights of the common African peoples would continue to be unrecognized by the postcolonial state.

While the legacies of colonialism continued to concern political thinkers, new and urgent issues emerged with formal independence and the maturing of the African nation-state. The end of the Cold War created another set of political circumstances that allowed for a fuller development of civil space and of a vibrant civil society that also addressed the issues of the day. These issues included the corruption of political elites, the degradation of the environment, persistent poverty and the economic inequality between groups and classes in society, and the lack of political democracy. Sometimes inequality was characterized as taking place between men and women, at other times between the rich and poor, or between ethnic groups. One important contribution made by African political thinkers has to do with framing and thinking of ways in which societies can heal after experiencing extreme forms of social and political trauma, such as genocide.

Development of Postcolonial Theory

Today, African political thought's most significant contribution is to *postcolonial theory*, a broad term used to describe theories devised to understand the formerly colonized world. Beginning with the Bandung Conference of 1955, its founders include Nasser, Fanon, Cabral, Marcus Garvey (1887–1940) and Walter Rodney (1942–80, Guyana). This school of thought dovetails with the contributions made by decolonization theory in its analysis of the ways in which colonial political structures continue to affect contemporary African politics. Postcolonial theory offers a variety of approaches to understanding the postindependence era and proffers different solutions to the issues of the day. African theorists have developed a sustained examination of the postcolonial African state that often is a searing criticism of the elites who utilize power in their self-interest,

sometimes expressed in theoretical works while at other times in literature and music. The work done by Achille Mbembe (Cameroon) is particularly noteworthy in this regard. Other contributors and activists include Chinua Achebe (1930–, Nigeria), Kwame Anthony Appiah (1954–, Ghana), Fela Anikulapo-Kuti (1930–1997, Nigeria), Alaa al Aswany (1957–, Egypt), Steve Biko, Wangari Maathai (1940–2011, Kenya), Ken Sara-Wiwo (1941–95, Nigeria), Wole Soyinka (1934–, Nigeria), Ngugi wa Thiong’o (1938–, Kenya), Nawal el Saadawi (1931–, Egypt), and Desmond Tutu (1931–, South Africa).

One issue of significance to political theorists and activists is environmental degradation, especially of the land that in turn impacts the livelihood and way of life of many groups. In Nigeria, Sara-Wiwo spoke out against the activities of the transnational oil companies that had resulted in an environmental catastrophe in the Niger Delta and for the Ogoni people. The oil companies’ activities were accomplished with the cooperation and collusion of the Nigerian government. He described the Ogoni as being similar to the Aborigines of Australia in the dispossession of their land and the destruction of their culture. For Sara-Wiwo, the Ogoni were living under an indigenous colonialism, an idea taken from Awolowo, and they deserved to have a protected status. Sara-Wiwo attempted to provide the Ogoni people this protection by taking their cause to the United Nations. He also called for the revision of the current federal form of governance in Nigeria to allow for all minority groups to participate in politics and to distribute economic resources more equitably. Sara-Wiwo’s execution along with nine of his followers by the Nigerian government provoked worldwide condemnation, and his call for an end to the corruption of a postcolonial regime is continued in the writing of others, most notably, Soyinka. In East Africa, activism to combat deforestation and soil erosion and the impact this had on Kenyans’ lives was initiated by Wangari Maathai, who in 1977 launched the Green Belt Movement, a grassroots women’s movement that planted thirty million trees in the country. Maathai was also critical of the corruption and the patriarchal nature of the Kenyan power structure, which marginalized women.

In North Africa the corruption of the political elites led to three revolutions in Tunisia, Libya, and Egypt in 2011. Alaa al Aswany, an Egyptian dentist,

journalist, and novelist, criticized the corruption of the Hosni Mubarak regime and its widespread use of torture and violence. This apparatus of despotism went hand-in-hand with extreme forms of nepotism and favoritism and a blatant disregard for the human rights of Egyptians. For al Aswany, the solution was the adoption of selected key principles of democracy: free and fair elections, a meritocracy, and respect for the rights of workers and the human dignity of all citizens. Postcolonial feminist writings had made many of the same points for decades: for example, Nawal el Saadawi, an Egyptian feminist, novelist, and physician, has written extensively about the imbalance of power between men and women, the patriarchal power structure that is rife with corruption and hypocrisy and that depends on the subservience of women to men and to religious authority.

With the end of the apartheid regime, the question of how to resolve the great injustices perpetrated upon the majority of South African society, especially upon its African population by the state, became an issue of pressing importance. This question was to reappear in Rwanda in 1994 and later in Sierra Leone. The need to establish processes to ensure justice for those who suffered from violence was urgent, along with the need for peace, security, and reconciliation. Yet the magnitude of the violence perpetrated upon society made traditional Western forms of justice impractical and inapplicable. Indeed, Bishop Desmond Tutu did not consider Western forms of justice, as established after World War II, even desirable. He articulated a different philosophy that was adopted in South Africa's solution: the Truth and Reconciliation Commission (TRC), which stressed reconciliation as opposed to retribution. The TRC was based in part on the Southern Bantu notion of *ubuntu* or forgiveness, and such courts have been widely copied and altered to fit the circumstances in many places, including Rwanda in its adoption of *gacaca* or grassroots courts and in Cambodia. The global appeal of this alternative to Western ideas of justice constitutes one of the most significant aspects of contemporary African political thought.

The multiplicity, pluralism, and richness of African ideas should no longer be ignored by political theorists in the West. In an increasingly interdependent world, there is an urgent need to comprehend the ways in

which groups and nations understand and shape their political environment. Modern African political theory has dealt with the most salient issues pertaining to human rights since the eighteenth century and has insisted, among other things, that human values and dignity must be preserved in the face of adversity.

Alienation

Alienation

Alienation

Alienation has been defined as a negative separation, estrangement, or disengagement of persons from political processes and structures. Broadly, alienation signifies the aberrant fragmentation of things that naturally belong together. In a democracy, people are alienated when they are disconnected or divorced from participation in political life since democracy entails that political power belongs to every citizen. Cynicism about political organizations, a sense of powerlessness, and loss of community attachments are manifestations of alienation.

The concept of alienation was introduced to modern political thought by Georg Wilhelm Friedrich Hegel, who used the term to describe the unhappy consciousness of oppressed persons in the European Middle Ages, dissociated from favorable social relations in this world and hence longing for freedom and contentment in a transcendent world. Hegel rejected the claim that political relations are or ought to be based on a social contract, arguing instead that the ethical nature of human beings and civil society form the foundation of political life. The freedom of the individual citizen to will values and beliefs that are universally held would constitute social and political harmony and thus might overcome alienation.

Influenced by Hegel, Karl Marx brought the concept into prominence by arguing that alienation could only be overcome by eliminating wealth and class differences between oppressed persons and the bourgeoisie. Contrary to Hegel, Marx believed that estrangement was not caused by an unhappy

consciousness hoping for redemption in a heavenly realm, but by the material conditions of one's life and the political economy in which one lives. For Marx, the fragmenting effects of alienation are rooted in economic inequalities, which are the product of sociopolitical structures under the influence of capital. Despite differences in terminology and tone between his early and late writings, he remained committed to the idea that alienation could only be reduced by some version of communism. Marx argued that capital, especially through the form of capitalism, had the power to transform itself through various crises, to reinvent itself, so that capitalism would continue to wield power over the sociopolitical circumstances of ordinary working people. Hence, the disenfranchising effects of capitalism may be controlled only through some form of market socialism.

During the early twentieth century, many political groups, social activists, and scholars influenced by Marx formulated critiques of and responses to alienation. In Eastern Europe and Asia, various forms of communism arose. In Latin America, theologians combined religious ideas and values with neo-Marxian perspectives to form the liberation theology movement, focusing on social justice and a preferential option for the poor. The Frankfurt school, a group of scholars that formed the Institute for Social Research in Western Europe and later the New School of Social Research in the United States, developed neo-Marxian analyses of social and political problems that came to be known as critical theory. Critical theorists challenged Western imperialism, privately held means of production and resources, and other aspects of mass culture and personal existence.

In the mid- to late-twentieth century, analyses of alienation turned toward economic disparities, political affiliations of the working classes, the power of the military-industrial complex, and broader social aspects of life. Particularly in the United States, the Vietnam War, Watergate, Iran-Contra, Reaganomics, the war on terrorism, and purported tax cuts for the richest citizens all contributed to a general decrease of trust in government and political participation and to increases in social tension.

The collapse of authoritarian communism in Europe shifted attitudes toward the presence of alienation in society, prompting some to cast doubts about

its negative effects or to deny its existence altogether. Consequently, from the latter part of the twentieth into the twenty-first century, research into the concept of alienation coalesced around empirical and measurable aspects. These include community involvement, senses of empowerment, and political participation, using tools such as job satisfaction and life satisfaction surveys and extensive polling and voter turnout data. Civil unrest, ethnic genocide, regime changes, and political overthrows of dictatorships are also indications of contemporary manifestations of alienation. Individuals and interest groups, many uninfluenced by the Marxian tradition, continue to assess and work against the corrosive effects of political disengagement and loss of social capital, or the advantages gained by effective social networks. Communitarianism emphasizes the importance of community and social interaction and the need to renew forms of public life. The rise of identity politics, focusing on forms of collective consciousness and differentiation, critiques new social movements in light of homogenizing effects of political participation and the extent to which heterogeneity is tolerated. There is also tremendous interest in the impact of social media on various forms of alienation, and how it may contribute to social change.

Althusser, Louis

Althusser, Louis

Althusser, Louis

Louis Althusser was born in October 1918 near Algiers. A devout Catholic in his youth, he founded a student Christian movement and even considered a religious vocation. He was called up for military service in September 1939, and in June 1940, was taken prisoner-of-war, spending the rest of World War II in a German prison camp. After the war, he became a tutor in philosophy at France's elite university the *École normale supérieure*, where he remained for the rest of his career. In October 1948, like many French intellectuals of the period, Althusser joined the Communist Party. Throughout the 1960s, he published a series of highly influential studies of the philosophy of Karl Marx, collected in *For Marx* (1965) and *Reading Capital* (1965). Censured for these works by the French Communist Party in 1966, Althusser spent the next few years revising his philosophical positions and publishing several essays of self-criticism. During the late 1970s, he wrote an increasingly bitter series of articles and letters criticizing the theory and the practice of the Communist Party, whose continued electoral losses in the face of projected victories indicated to him a party out of touch with the reality of French political life.

Althusser suffered from bipolar disorder throughout his life. In November 1980, following the worst of his depressions, he killed his wife and companion of over thirty years, Hélène Rytman. Amid much public controversy, he was declared unfit to plead to the crime on the grounds that his mental state rendered him irresponsible for his actions. He spent most of the rest of his life in psychiatric hospitals, his career as a teacher and public

intellectual over. He died in October 1990. After his death, tens of thousands of pages of unpublished manuscripts, including some ten books, were found in his archives. Many of these have been published during the 1990s, massively altering the public reception and understanding of his thought.

Marxist Humanism

The period following World War II saw the rise, in European philosophical circles, of Marxist humanism. Humanism, as Althusser once defined it, is any system of thought that places man at the center of the world. Althusser was profoundly convinced, against almost all of his contemporaries, that Marxism was not such a system. In the 1930s, Karl Marx's *Economic and Philosophical Manuscripts*, written in 1844, had been published for the first time. This is an early work of Marx's, in which he explicitly describes the problem of capitalism and the solution of communism in humanist terms. Influenced by these texts, many philosophers, from Catholics to existentialists, became interested in Marx's work and began to incorporate it into their own. In the late 1950s, following the denunciation of former Soviet Premier Joseph Stalin by his successor Nikita Khrushchev, communist intellectuals too began to argue, on the basis of Marx's early work, that Marxism was essentially a humanist form of thought.

The Epistemological Break

Althusser vigorously denies that Marxism is humanist. Marx's thought does not develop from the humanism of his early work into the historical materialism, although Marxist tradition describes Marx's mature work as this system of thought. Such a development is inconceivable, Althusser argues, since every system of thought has its own internal unity, its own set of problems that it poses and solves. The set of questions asked by humanism and that asked by historical materialism are simply incommensurable with one another. Marxist tradition describes historical materialism as a science, the science of the history of society, because it produces true knowledge of this history. It was necessary for Marx absolutely to reject the humanism of his early work, Althusser argues, in

order to found this science. What occurs in Marx's thought in 1845, he claims, the year Marx wrote the *Theses on Feuerbach* and *The German Ideology*, is an epistemological break, a phrase that effectively means a scientific revolution. This phrase is taken from the philosopher of science Gaston Bachelard, who understood the history of science to progress by a series of such breaks, both with common sense and with previous scientific theories, in which completely new kinds of theory are founded. Marx did precisely this, Althusser argues, in his authentically Marxist works. He founded the science of history. As in all scientific revolutions, he did not just give new answers to the old questions; he asked a completely new set of questions. Before 1845, no one had ever truly understood the history of human society; Marx, for the first time, discovered how to do so.

Structuralism

Althusser devotes considerable space in his major work of the 1960s to expounding the details of this new science, of which Marx, he argued, had left only the cornerstones. Here, we need to mention the influence of structuralism on Althusser's thought. Althusser is sometimes described as a structuralist Marxist. This description is a mistake. Structuralism, rather, was the intellectual milieu in which Althusser worked out his conception of authentically Marxist science and with which he shared certain basic approaches. Structuralism was an interdisciplinary movement that became the height of intellectual fashion in France in the 1960s. We will mention here only what Althusser has in common with its major exponents. First, structuralism was an antihumanist method of inquiry. It understood the objects it examined—from kinship relations to novels to the unconscious mind—as products not of individual human beings but of social systems. A novel, for example, was not the product of the genius of its author but of the unconscious system of rules for writing novels in the society in which it was produced. In a similar way, Althusser believes that a society, as Marx had truly understood it, is not a collection of individuals but a system, the nature of which determines the lives of all the individuals within it. Second, structuralism understands the objects of its inquiry as systems of elements in relationship. The meaning of a given passage in a novel does not consist in its relationship to reality but in its relationship to all the other passages and kinds of passage in the novel. Althusser understands society in the same

way, as a system made up of elements that can only be understood in terms of their relationship to all the other elements in the system.

The Science of History

Like other scientific revolutions, Althusser argues that the revolution in the science of history founded by Marx involves new terms and new relationships between those terms. In place of the term *man*, the fundamental concept of the ideology of humanism, Marx puts the *mode of production*, the fundamental concept of the science of historical materialism. The mode of production—the ways in which society produces the material conditions of its members' lives—is the most fundamental reality of social life for Marx. He develops a new lexicon of terms in order to expound this insight—terms such as *class*, *ideology*, *base*, and *superstructure*. By speaking of the mode of production as the economic base of a society, Marx means that it determines everything else that occurs in that society. All the institutions (the legal system or the education system, for example) and all the discourses (philosophical ideas or novels, for example) of that society can be described as a superstructure arising from, and caused to be the kind of things that they are, by that base. Marx's friend and coauthor Friedrich Engels adds that the base is only the ultimately determining element of the superstructure. Althusser develops this principle in detail.

A society, he argues, consists of numerous levels of *practice*. By practice, he means a process in which a certain set of raw materials is transformed into a certain product by a certain means of production, or combination of labor and technology. In political practice, for example, the raw materials of social relations are transformed into a new set of social relations by means of political organizations and the policies on which their actions are based. When Engels claimed that economic practice determines all the other practices in society only in the last instance, Althusser argues, what he meant was this. Each social practice has a relative autonomy, meaning that it develops according to its own logic and not simply as a result (as Marxist tradition has often claimed) of the economic base of the society in which it occurs. A novel, for example, is the kind of novel that it is partly because of the economic system of the society in which it was written. But it is also the

kind of novel that it is for purely literary reasons—the novelist’s responses to earlier novels, for example. Furthermore, as Althusser makes clear, it is the kind of novel it is for a host of other reasons, each pertaining to a different kind of social practice, and indeed to a complex relationship between those social practices. For example, it may be determined by the legal system, the education system, the publishing industry, philosophical or religious beliefs, the institutions of marriage and family, or political events within the society in which it is written, to name only a few. Furthermore, each of these influencing factors is itself influenced, in varying degrees by all the other factors. This, therefore, is how all social events are to be understood, Althusser argues, as overdetermined, or determined in a complex and mutually influential way by all the practices in the society in which they occur. Economic practice, as Marxist tradition has always known, will be determinant in the last instance, but as Althusser puts it, the last instance never comes. Every event in every society is a product of the complex interrelationship between all the social practices that comprise that society.

Ideology

One of Althusser’s most lasting contributions to modern political thought has been his development of the Marxist theory of ideology. *Ideology* is the name Marxist tradition gives to all those discourses that misrepresent the reality that the economic base of society consists of the exploitation of one class of its members by another. Marxist tradition has typically described ideology in terms of consciousness, comparing an individual’s consciousness of his or her social conditions to the reality of those conditions. Althusser argues, however, that ideology is primarily an unconscious phenomenon. It comes to us in the form of obviousness—of common sense, popular opinion, what people can take for granted. The messages mediated to us by the advertisements with which we are constantly surrounded in contemporary society, for example, but to which we rarely pay critical attention are the kind of messages that make up the ideological world in which we live. Indeed ideology is our lived world itself, Althusser argues, our more or less conscious everyday understanding of society and of our places in it. In a later essay, he writes that ideology represents an imaginary relationship to individuals’ real conditions of

existence. It is a kind of wish fulfillment, giving people an account of how they like to think of their lives rather than of the reality of their lives in the capitalist mode of production.

Ideological State Apparatuses

In his essay “Ideology and Ideological State Apparatuses,” written a year after the failure of the French Communist Party to respond to the revolutionary events of May 1968 in France, Althusser develops the concept of the ideological state apparatus (ISA) (Althusser 1971). Marxist tradition has always regarded the modern state an institution that serves the interests of the bourgeoisie, or owners of capital. The state defends these interests with what Althusser calls the *repressive state apparatus*—the police, the courts, the prisons, the army, and the like. It also defends these interests with what he calls the *ideological state apparatuses*—that is, institutions that serve to perpetuate the economic dominance of the bourgeoisie not by repression but by ideology. These institutions include the church, the education system, the family, cultural institutions such as the theater or the cinema, the media, the legal system, and the like. These institutions, Althusser argues, along with the practices and rituals that comprise membership in them structure the dominant ideas of class society. Indeed, ideology exists in no other form than in the practices and rituals of the ISAs. ISAs do not develop out of our ideological beliefs; rather, our ideological beliefs develop out of membership in and participation in the practices of ISAs.

The Subject of ideology

These beliefs are unified, Althusser claims, by the fundamental category of all ideology, the subject. All ideology, he writes, whether it comes to us through attending a trade union meeting or going to the cinema, “hails or interpellates individuals as subjects” (Althusser 1971, 173). The French verb *interpeller*, translated in this phrase as hails or interpellates, means to call out to someone. It is also the verb used when the police interrogate a suspect. Like the police, ideology works for the state. When Althusser says that ideology interpellates individuals as subjects, he means that it has the

effect of making an individual believe that he or she is a subject, the origin and agent of his or her own thoughts and actions. According to the Marxist science of history, however, this is not true: it is the mode of production that determines every material condition of people's lives. But ordinarily, people do not think of their lives in these scientific terms because ideology is persuading them that they are, by and large, in control of their own destinies. By doing so, it ensures that in reality people remain subjects in a second sense—subjected to the authority of the state. Although it is during the period of industrial capitalism in particular that the subject becomes a category of political philosophy, Althusser argues that it has always been the fundamental category of ideology—it has simply had other names, such as the soul or God. In every case, by deluding us that we are subjects, in the sense of free and autonomous agents, ideology ensures that in fact we remain subjects, in the sense of subjected beings, of the class that dominates the society in which we live.

American Political Thought

For many Americans, American political thought consists primarily of celebration of the Declaration of Independence of 1776 and the Constitution of 1787, along with *The Federalist Papers*, which helped win ratification of the Constitution. But the American tradition of political thought and practice, mixing radical and conservative elements, originated much earlier. It was first rooted in the laws, religious conflicts, and economic systems of Europe transplanted by the settlers and second, in the philosophy and practices of the indigenous Americans with whom the Euro-American colonists interacted regularly in the seventeenth and eighteenth centuries. The abiding themes of American political thought—freedom, equality, their synthesis in contending American views of justice, and democratic republicanism—have diverse and conflicting roots.

European and Indigenous Roots

First, fleeing persecution, poverty, and autocracy, British colonists arrived on American shores with their own ways of thinking, interacting, and governing. The Puritans among them were inclined them to question authority and reject hierarchies both in church and in government. Although seventeenth-century Puritans such as Cotton Mather and Massachusetts Governor John Winthrop believed that the Bible justified authoritarian governance, Harvard-educated preacher John Wise argued just the opposite:

that according to Scripture, a devout Christian congregation should be governed democratically. Roger Williams, Puritan-raised founder of the U.S. Baptist Church and of Rhode Island, pressed principles of freedom even further by arguing for tolerance of and equal political rights for believers of all stripes, including religious dissidents such as Anne Hutchinson and even nonreligious agnostics and atheists.

Second, under their colonial charters and patents, colonists locally practiced the essentials of John Locke's theory of popular governance, including belief in an initial state of nature, natural law, individual rights, emphasis on private property (especially land), and social and political contracts among the property-owning Christians who comprised their communities. These shared political beliefs distinguished the colonists from British subjects who believed in absolute monarchy, eventually firing the colonists' revolt against British rule. The Glorious Revolution of 1688, ending absolute monarchy in England, further justified the American colonists' belief in the admissibility of popular revolt.

In the late twentieth century, scholars such as Donald Grinde and Bruce Johansen showed that many colonists, including not only Williams but also such notable founders as Benjamin Franklin, Thomas Jefferson, and Thomas Paine, had close and friendly relationships with American Indian nations, especially the Iroquois. Speaking their languages, attending their treaty councils, publishing their proceedings, trading, gifting, and visiting back and forth, these influential colonists learned of Native Americans' longstanding systems of democratic rule over large areas, as well as the various institutional checks and balances they used to prevent any one group from dominating over others.

No European nation exemplified John Locke's theory of large-scale government by consent of the governed, with institutional checks and balances, accompanied by the protection of individual rights, as had numerous American Indian confederacies for centuries. These indigenous systems also contained features deemed too radical for inclusion in the original Constitution but that were later incorporated in the development of American political thought and practice, including women's right to vote, opposition to ethnic discrimination and slavery, respect for elders combined

with a voice for youth, aid for the disadvantaged, religious tolerance, environmental protection, and the equivalents of initiative, referendum, and recall.

Beginning in the 1740s, Iroquois leaders such as Canassatego urged the colonists to create their own confederation of colonies against the British. Notably, the colonial rebels at the Boston Tea Party dressed as Mohawk Indians, and the colonists used numerous native symbols and phrases in their own iconography, including the “Great Tree,” “Unite or Die,” “League of Friendship,” and the federal eagle clutching a bundle of arrows on U.S. one-dollar bills. At the Constitutional Convention of 1787, delegate James Wilson made a general reference in his notes to Iroquois precedents.

As British policy became harsher, colonial critics faulted the government for violating traditional British law, especially in Parliament’s increasingly onerous taxation policies. Middle-class, formerly loyal business and professional British Americans, felt especially aggrieved, touting what would become a core American political belief, the rule of law. These men formed the decisive group from which the leadership of the independence movement came, giving rise to the ironic characterization of the American Revolution as a revolution by due process of law. Revolutionary slogans such as “no taxation without representation” later became enshrined as cornerstones of American political thought.

The Constitution as the Centerpiece

The core American political theory of a federalist system of liberal democracy, or classical liberalism for short, emerged from the practical political considerations of the Founding Fathers, a group not so democratic or radical as 1776 revolutionaries such as Paine, Samuel Adams, and John Hancock. This 1787 group was comprised of slave owners such as Jefferson and George Washington as well as early abolitionists such as Benjamin Rush and Alexander Hamilton. It included commercial interests from the Eastern Seaboard and landowners from the South, combined small farmers with a new urban working class, and opposed large states such as New York and Virginia to small states such as Connecticut and New Hampshire. What has become known as the core American political theory and system of

government reflected key compromises among all of these self-interested entities.

The real task of nation building—and incidentally of constructing a story to go with it, that is, American political thought—began at the Constitutional Convention of 1787. Ostensibly, James Madison and Hamilton called for the convention after the failure of the Annapolis Convention of 1786 to attract enough delegates from the various states to accomplish its purpose of revising the 1781 Articles of Confederation so as to promote commerce among the states. But the practical source of the call was Shays's Rebellion of winter 1786–1787, in which the debts and frustrations of the postrevolutionary period had led to an uprising of former revolutionary soldiers and impoverished farmers in western Massachusetts. Led by Captain Daniel Shays, this rebellion forcibly closed the courts and prevented foreclosure of mortgage debts, alarming not only creditors but also the more affluent people of the times.

The risky action of separating an infant nation from its parent, England, seemed to many to portend anarchy, and the Iroquois-inspired, revolutionary Articles of Confederation had avoided creating a strong central government. Consequently, the states began to nominate their most reliable men of stature to go to Philadelphia in 1787 and to find a way to hold things together. Among the more conservative attendees, George Washington agreed to forego a meeting of the Society of Cincinnati, the organization of former Revolutionary War officers, to preside over the convention. Representing more liberal tendencies was the aging Franklin. Attendees found they had much in common: their wealth, membership in Masonic orders (fifty-one of fifty-five attendees), and experience in making republican institutions work in their diverse states. They were quite distinct from the bold group that had brought forth the Declaration of Independence in 1776.

And yet, they were more than bold enough. Meeting under agreed rules of secrecy, the convention's first major act was to violate the delegates' instructions to merely revise the Articles of Confederation—under which the country had been governed from the war to the present—and instead to draft an entirely new and comprehensive governing document. In effect, the

founders carried out a *coup d'état*, an ironic basis for an envisioned government based on the rule of law. Intense debates ensued, with the delegates deeply divided over many issues. Most controversies were decided by compromise, such as those between big states and small states, or the South and the North. But some major issues, such as enfranchisement, civil liberties, and the ultimate status of slavery, were adroitly postponed for later decision. Ratification was left to those qualified to vote in the various states—primarily propertied adult white males—acting in conventions specially called for that purpose in each state.

The Campaign for the Constitution, the *Federalist Papers*, and the Bill of Rights: Legacies for the Nineteenth Century

Since the Constitution, American political thought has blended reformist and conservative impulses, as evident in the process by which the Constitution was written and approved and in its aftermath in the nineteenth century. The Declaration of Independence had asserted the political right of an oppressed people to overthrow their oppressors. The Constitution, by contrast, was calculated to preserve the socioeconomic status quo while its soon-to-be-added (in 1791) Bill of Rights promised to protect the rights of individual Americans both from oppressive government and from majority tyranny. Americans have always taken pride in their foundational war of independence, but the pluralistic, liberal-democratic (or democratic-republican) government that evolved over the next two centuries has preserved the class society of democratic capitalism, even while extending political rights to additional classes of citizens. Consequently, a core part of American political thought has been to secure the rightful place of an economic system of private property, free-market competition, and the rights and duties of contract.

Cutting across the many interest-group cleavages of the founders was their shared ideology of classical liberalism, based on individual rights, private property, free enterprise, limited government, and the rule of law. In *The Liberal Tradition in America*, Louis Hartz argued that this unique American brand of liberalism has held such predominant sway over the political

thinking of Americans that classical-conservative and radical alternatives have struggled at the margins of the country's political discourse. Even those antipodes of mainstream American political thought Jefferson and Hamilton fell safely under the classical-liberal umbrella.

The Constitution was an object of controversy from the very start. Supporters avoided the accurate but politically unwise label of nationalists and chose Federalists instead. Opponents were left with the ambiguous label of anti-Federalists. Unaddressed by these labels were the Constitution's enabling of a strong central government; its bias in favor of property rights, hard money, and the pursuit of debtors; and its complete lack of protection for civil rights and liberties. To the extent that governing documents can shape the future, the message of this one was a guarantee that there would never be another Shays's Rebellion. Moreover, the forceful methods and unseemly haste with which the Federalists pressed for ratification raised additional questions about the political neutrality of the document itself—a point famously raised by historian Charles Beard in his 1913 book *An Economic Interpretation of the Constitution*.

In this context of partisan controversy, Hamilton and Madison, aided by John Jay, wrote a series of papers addressed to the people of New York, a crucial state disinclined to embrace the Constitution in the ratification vote to be held in the early summer of 1788. These papers, published anonymously as the work of "Publius" in the New York newspapers, soon became known collectively as *The Federalist*, or *The Federalist Papers*, when published in book form in the spring of 1788.

The Federalist was an act of advocacy, espousing the fundamental American view that governmental checks and balances would prove the key protection against tyranny. Separation among legislative, executive, and judicial powers and the division between national and lower levels of government would prevent any particular group from running roughshod over other groups. As Robert Dahl has shown, the philosophical imprecision of the argument—both democratic and antidemocratic—reflected its authors' overriding goal: to reconcile conflicting interests and achieve ratification in the upcoming vote of the qualified electors in the states (fewer than 5 percent of the residents). Many pamphlets and articles

were written contemporaneously to refute *The Federalist*, but none attained comparable visibility or political significance. *The Federalist* soon became the definitive story of the Constitution's meanings and their justifications, joining the Declaration and Constitution as the premier documents in American political thought.

A key compromise helping secure ratification of the Constitution was an agreement by the drafters to add a Bill of Rights soon after ratification was achieved. The original Constitution's lack of protection of individuals from the government and potentially tyrannical majorities had concerned Jefferson and his friend and *Federalist* author Madison. Within a few years, rights to free speech, press, and assembly; of religion; to a fair trial; and against cruel and unusual punishments, among others, were added as the first ten amendments to the Constitution, collectively called the Bill of Rights.

Events of the nineteenth century reflected key features of both the Declaration of Independence and the Constitution. First, the pluralistic diversity protected by the Constitution was soon reflected in the development of an oppositional political party, Jefferson and Madison's Democratic-Republicans, favoring individualism and the states, to compete with the strong-government and nationalist Federalist Party of George Washington, Hamilton, and John Adams. Although George Washington's two terms as president were relatively uncontroversial, his successor, John Adams, alienated many fellow Federalists with the Alien and Sedition Acts, which violated the Bill of Rights by making various forms of opposition to the government illegal. When Democratic-Republican Jefferson was narrowly elected president in 1800, outgoing Federalist John Adams took the opportunity to appoint several Federalists to newly created judgeships and John Marshall, his outgoing Secretary of State, as Chief Justice of the United States. This move effectively passed the role of spokesperson for the Federalist opposition to Marshall.

Second, subsequent events reflected the importance of the judicial provision of the Constitution. A devoted strong-government Federalist and avid admirer of first Secretary of the Treasury Hamilton, Marshall set about to make the Supreme Court, and the judiciary generally, a genuinely co-equal

branch of government. One of his tactics was to rally the justices to support a single position or opinion in disputed cases, so it would appear that all were united in judgment and reasoning—and thus able to speak with a more powerful voice. Another of Marshall's moves was to assert in practice, in the famous 1803 case of *Marbury v. Madison*, the Court's power of judicial review, as had been theoretically claimed by Hamilton in *Federalist* #78. As a result, the Supreme Court, and not the states or the people, would become the final arbiter of contested interpretations of the Constitution.

This reading of the Constitution was highly controversial, raising the issue of the very nature of the union. Was it a continuing contract among the states so that the states were the only proper final authorities, capable both of interpreting the meaning of the Constitution and of seceding from the contract and the union if they so desired? Or was it a completed act of the people, forever unifying the nation and assigning the task of interpreting the Constitution to one institution of the national government, the Supreme Court? Jefferson and Madison always held to the first view, Hamilton and Marshall to the second. In litigation just before the Civil War, Chief Justice Roger Taney tried to apply the rights of states view on behalf of the South's position on slavery, only to be rejected by Abraham Lincoln and Northern armies.

In retrospect, Southerners such as Jefferson and Madison probably had the better of the historical argument, but of course not the moral or practical one. Proslavery Southern thinkers such as John C. Calhoun and George Fitzhugh maintained that black slaves, naturally inferior to whites, enjoyed a better life under benevolent Southern plantation owners than they would have under the dog-eat-dog Northern free market. Indeed, Fitzhugh contrasted the easygoing life style of black slaves with the desperate plight of Northern, legally free "wage slaves," whose employers' concern for them stopped the minute they left work.

By contrast, abolitionists like Benjamin Rush, William Lloyd Garrison, and former slave Frederick Douglass argued that any inferiority of African Americans was attributable to their unequal treatment at the hands of the racist white majority of the times, especially under slavery. No good Christian, these critics claimed, could countenance the brutality and

injustice of treating other human beings as property. Not only Christ, they exclaimed, but also the Declaration of Independence and the Bill of Rights militated against such shameful denials of freedom and equality. The original Constitution—and Madison's *Federalist* #54—had equivocated on the issue of slavery, counting each slave as three-fifths of a person.

As an attempted justification of slavery, judicial review fell into temporary disrepute—not to reappear until the 1880s when the Court gave it new life in defense of corporations, property, and privilege. In the meantime, the Civil War amendments expanded the power of the national government against the states by freeing the slaves, extending the right to vote to African Americans, and ensuring all citizens due process and equal protection of the laws. Thus, the Constitution took on a much clearer and more democratic and national character and scope.

Complicating matters further in the decades surrounding the Civil War, two new ideologies, inspired by the egalitarian values of the Declaration of Independence, were propounded by political movements with a national scope. A feminist movement in the nineteenth century, led by women such as Elizabeth Cady Stanton and Susan B. Anthony, challenged the patriarchal dominance of men in American government and society. Why, they asked, should the rights guaranteed in the Declaration of Independence and the Bill of Rights not be extended to women as well as men? If the young country was based on freedom, equality, and justice, how could it justify arbitrary inequalities and restrictions of women's liberties? Wasn't this disparity the epitome of injustice?

In the decades prior to the Civil War, a second movement, the Jacksonian Revolution, swept through the states demanding equal political rights for poor white males. Similar to the reasoning of feminists, the Jacksonian argument held that the classic American rights could not justly be withheld on the basis of a person's economic standing. As a matter of political exigency, the controversial issue of who should have the right to vote had been left to the states by the Constitution of 1787, thus depriving most poor white males of the right to vote enjoyed by their wealthier counterparts. Now, male farmers and laborers demanded political equality for themselves, finding success in state after state before the Civil War. Thus, the

Jacksonians challenged the oligarchical balance of U.S. government, a democratic impulse resisted briefly by the probusiness Whig Party before it was replaced after twenty years by ex-Whig Lincoln's new Republican Party in the mid-1850s.

American Political Thought: The Second Century

The second century of American political thought, from the 1870s to the tumultuous 1960s, saw variations on traditional themes of American political thinking rather than original new bodies of thought. These traditional themes encompassed racial and gender conflict, the government's role in resolving socioeconomic conflicts and crises such as the Great Depression, the increasing use of Hamiltonian means to achieve Jeffersonian ends, and revisions of traditional American foreign policy.

With the defeat of the South in 1865, radical Republicans carried out a program of Reconstruction in the South, barring former Southern officials from government while imposing racially egalitarian rule in the Southern states. Succeeding for a decade, the Republicans enfranchised black ex-slaves and enabled many to gain public office. Traditional American democratic-republican theory was thus temporarily applied in the former slave states on a one-person, one-vote basis. When Southern resistance stiffened, national military control enforced the terms by which Southern states could reenter the union and be represented in Congress.

By contrast, a conservative Supreme Court reinterpreted the Civil War amendments to render them ineffectual in protecting the rights of Southern blacks, and life for the newly freed black population began to resemble that of pre-Civil War days. By the time of the disputed presidential election of 1876, most Americans had tired of the struggle to support black rights and acquiesced in another North-South compromise, this time to give electoral ballots to the Republicans, who in turn agreed to withdraw federal troops from the Southern states. Thus, the narrow victory of Republican Rutherford B. Hayes over Democrat Samuel Tilden came at a high price for Southern blacks, denying their achievement of equal rights for a full century.

While black achievement of the American dream of freedom, equality, and prosperity was forestalled, black political thinkers of the early twentieth century achieved important milestones that eventually bore fruit in the Civil Rights and Black Power movements of the second half of the twentieth century. Educator Booker T. Washington, founder of the Tuskegee Institute, urged blacks to progress economically, by means of basic education and hard work, without threatening whites by demanding equal political or social rights. In *The Souls of Black Folk* (1903), Harvard-educated intellectual W. E. B. Du Bois took issue with Booker T. Washington, arguing that African Americans would never overcome the inherited disadvantages of slavery without demanding political rights, equal access to public facilities, and higher education. Du Bois connected the personal with the political, explaining why blacks' effective pursuit of happiness and political empowerment required them to overcome their own feelings of inferiority. Harlem Renaissance poet Langston Hughes picked up on these themes in politically charged poems such as "A New Song," "Let America Be America Again," and especially, the foreboding "Harlem, or Dream Deferred." Hughes later inspired both civil-rights leader Martin Luther King Jr. and the Black Power movement.

Similarly, the first-wave feminist movement of the nineteenth century did not achieve women's national right to vote until the Nineteenth Amendment was passed in 1920. Anarchist feminist Emma Goldman warned in 1910 that legal rights to work and vote were only part of the battle for women's equality. Her emphasis on women's psychological and cultural liberation presaged later waves of feminism in the late twentieth century. Still, the right to vote has made a difference. As poor white men, people of color, women, and eighteen-year-olds successively won the franchise, U.S. government came to represent more than just the white male property owners who wrote the Constitution. This broader-based, more democratic government became a less consistent supporter of the status quo and thus, in the twentieth century, became less popular with conservatives and more popular with reform-oriented liberals.

The rapidly expanding industrial economy of the United States in the late nineteenth century raised new issues for American political thinkers and policy makers confronted with corporate robber barons, increasing labor

strife, and boom-and-bust cycles of unregulated capitalism, culminating in the Great Depression of the 1930s. Franklin and Jefferson had warned of the political dangers of powerful corporations, “which might challenge our government to a trial of strength and bid defiance to the laws of our country,” as Jefferson put it in a November 12, 1816, letter to George Logan. Before and after the turn of the century, the ideas of the pro-farmer and/ or labor Populist Party, unionists, the Progressive movement, and socialist novelist Edward Bellamy challenged the status quo, while the federal government, contrariwise, diverted troops from enforcing Reconstruction in the South to breaking strikes in Northern cities.

Meanwhile, the Supreme Court steadfastly supported the status quo by first holding that corporations were persons for the purpose of asserting their rights under the Constitution and then adding new rights requiring that legislative regulations applying to the uses of corporate property be reasonable in the eyes of the Court. Presidents William McKinley (1897–1901) and William Howard Taft (1909–13) favored the corporations, while Presidents Theodore Roosevelt (1901–09) and Woodrow Wilson (1913–21) railed against them. Industrialists such as John D. Rockefeller and Andrew Carnegie (1889)—the world’s two richest people—argued that private philanthropy, not governmental intervention, was the key to ensuring that great accumulations of wealth served the public good.

Also promoting ideological support for the status quo was the Social Darwinism of thinkers such as Yale-educated William Graham Sumner, whose 1884 book *What Social Classes Owe to Each Other* answered its own question with a resounding “nothing.” In short, life is a struggle in which some survive and thrive but others falter or die. The government, according to Social Darwinists, should not intervene to tax the successful in order to aid the needy. Its role, rather, was to maintain a fair competition and prevent political oppression of one group by another. This rather hard-hearted approach, they claimed, would in the long run promote the survival of the fittest and lead to improvement in the human race.

These disputes over the proper uses of power and wealth engaged two longstanding threads of American political thought: the Jeffersonian fear of excessive corporate and governmental power and the Hamiltonian

commitment to business and a strong and business-friendly national government to promote the economic development of the United States. Theodore Roosevelt's primary idea man, Harvard-educated theorist Herbert Croly, published in 1909 *The Promise of American Life* to reconcile these two competing bodies of thought and practice. Croly essentially argued that the treasured Jeffersonian goals of individual rights to life, liberty, and the pursuit of happiness required government to create the conditions under which these goals could be achieved. Large corporations could not be allowed to run roughshod over the American people, but neither should government get in the way of the economic incentives necessary to ensure that businesses would pursue reasonable profits as responsible corporate citizens. The national government must ensure a proper balance between free markets and national economic health.

Croly's theoretical synthesis of Jefferson and Hamilton was carried to its logical conclusion by President Franklin Delano Roosevelt in his efforts to combat the Great Depression of the 1930s. Aided by economic advisors influenced by economist John Maynard Keynes, Franklin Roosevelt greatly expanded the fiscal and monetary role of government in a large array of new public programs collectively known as the New Deal. In addition to providing a stimulus to and increased public regulation of the depressed economy, the New Deal became the employer of last resort in such public programs as the Civilian Conservation Corps and the Works Progress Administration. From the early 1930s on, never again would the government of the United States embrace the laissez-faire philosophy of unregulated, free-market capitalism. In American political thought and practice, the public good had become a public responsibility.

American thinking about foreign policy had traditionally been guided by two factors. The first was the reality of American expansionism, including the taking of land from indigenous Americans as well as overseas conquests in the Pacific (e.g., the Philippines) and in the Caribbean (e.g., Puerto Rico). This policy, called imperialistic by such critics as Henry David Thoreau in 1848 and later and at the turn of the century by Mark Twain, was justified by the ideology of Manifest Destiny, a term coined in the 1845 work *Annexation* by entrepreneurial journalist and lobbyist Jane Cazneau, urging U.S. annexation of Mexico.

The second major influence was the famous warning of President George Washington in his Farewell Address of 1796 that the United States should avoid all unnecessary foreign entanglements. In general, we would fare best by tending to our own affairs, he advised. This second tradition was evident in the widespread resistance to the United States' entry into World War II, overcome only by the Japanese attack on Pearl Harbor on December 7, 1941. Later, American isolationism was reversed by the Cold War that began between erstwhile allies the United States and the Soviet Union after World War II. Americans' perceived threat of global communism led to a U.S. policy of forward containment, conceived by diplomat George F. Kennan to prevent the Soviet Bloc from extending its sphere of influence and communist ideology beyond Eastern and Central Europe.

Post–World War II Americans came to think of their country as the world's policeman, especially after the disintegration of the Soviet Union in 1990. This initially defensive posture later took on a more offensive character under the influence of neoconservative ideologists such as Paul Wolfowitz. It accelerated in the wake of the September 11, 2001, terrorist attacks on the United States and culminated in the U.S. preventive invasion of Iraq in 2003.

New Voices in American Political Thought Since the 1960s

Croly's early twentieth-century synthesis of Jeffersonian individualism and Hamiltonian statism appealed to both Democrats and Republicans, liberals and conservatives, for much of the twentieth century but came unraveled beginning in the 1960s. No one or two American political theories any longer dominate most Americans' political thinking. But which of a bewildering array of new bodies of thought have captured a large enough audience for a long enough period of time to be reasonably considered contenders for lasting influence?

As in the past, Americans' recent political thinking germinated from real-life events and conditions. The 1960s sowed many seeds of change in American political thought and practice, including landmark civil-rights

legislation, the Vietnam War and opposition to it, women's renewed struggle for equal rights, hippie cultural radicalism, accelerating environmental crises, and efforts of ethnic minorities and homosexuals to find their voices and places in American politics and society. Shaped by these factors, and based on their track records over the past several decades, two old ideologies seem to have lost their coherence while three new modes of American political thought have emerged and flourished.

Conservatism and Liberalism: Compatriots in Incoherence?

The classical conservatism of Leo Strauss, with its dim view of human nature and call for strong government to curtail dangerous human impulses, has always struggled to compete with classical liberalism's more positive view and advocacy of limited government. More generically, conservatism by definition seeks to preserve the status quo, but the long-term trajectory of American politics has always been progress, reform, and change. Thus for more than two centuries, what U.S. conservatives have sought to preserve has been an ever shifting target. Conservatism's lack of consistent, long-term objectives has never been clearer than in the early twenty-first century.

U.S. conservatives—and the Republican Party—are divided among libertarians (including tea party advocates as well as quasi-anarchist philosopher Robert Nozick) who, like classical liberals, oppose big government; a corporate faction focused on business profits; the Christian Right, promoting social values like the sanctity of heterosexual marriage and opposition to abortion and trash culture; a law-and-order group notable for its opposition to illegal immigrants; and neoconservatives promoting the extension of American-style democratic capitalism around the world. Despite some overlapping interests, these conservative factions have many conflicting goals, especially regarding the proper role of government in the economy and private lives of citizens and regarding U.S. foreign policy.

Twenty-first-century U.S. liberals seem, if anything, even more divided than U.S. conservatives, with Democrats exhibiting even more dramatically

than Republicans the contradictions inherent in what Theodore Lowi has called interest group liberalism. Does justice require a chicken in every pot, with strong labor unions and guaranteed jobs for all? Or does it require special help, through affirmative action, for those—such as women and people of color—who continue to suffer the adverse effects of historical discrimination? But perhaps the concerns of humans, who have devastated the planet, should be subordinated to the ecological needs of all living things. The government cannot afford to do everything, so should U.S. foreign policy expend trillions to help the oppressed peoples of Iraq and Afghanistan, especially women and children, or should it retreat to isolationism? The Democratic Party seeks to represent dozens of progressive groups, but when these groups' interests conflict, Democrats appear, in Lowi's terms, to define justice by default as whatever is the outcome of the competition of interest groups—epitomizing cynic Ambrose Bierce's 1911 definition of politics as “a strife of interests masquerading as a contest of principles.”

In *A Theory of Justice* (1971), influential liberal theorist John Rawls tried to rise above special interests and reconcile the competing claims of liberty and equality, arguing in part that only those inequalities beneficial to the worst-off citizens were permissible. But a generation later, in *Political Liberalism* (1996), Rawls conceded that his formula for justice would not work in large, modern, multicultural societies such as the United States.

Beyond Liberalism and Conservatism: New American Political Thinking

Three important new bodies of American political thought have emerged since the 1960s to establish themselves as both formidable challengers to traditional thinking and as contenders for a permanent place in the pantheon of American ideologies: multiculturalism, ecology, and youth empowerment.

Multiculturalism

Beginning in the 1960s, white, Eurocentric, patriarchal ideologies came under increasing fire from American feminists and multiculturalists. Rooted in the traditional American value of equality, multiculturalism asserts the equal rights of women, people of color, religious minorities, and homosexuals. Just as nineteenth-century first-wave feminists asked why women should not equally enjoy the rights emblazoned in the Declaration of Independence and the Bill of Rights, second- and third-wave feminists have more recently challenged the political, economic, and cultural dominance of Christian, white, heterosexual males.

The Civil Rights Movement of the 1950s and 1960s sought to fulfill the centuries-old aspirations of African Americans for the full freedom, equality, and justice enjoyed by white Americans. Black, brown, and red power movements soon grew out of the impatience of African Americans, Latinos, and Native Americans with the slowness of racial progress, reflecting the civil disobedience of Martin Luther King Jr. Betty Friedan's 1963 book *The Feminine Mystique* triggered the second-wave feminist movement of the 1960s and 1970s, decrying culturally reinforced limitations on the choices and lifestyles of American women. Starting with the Stonewall riots of 1969 in Greenwich Village, gays and lesbians began to be more open about their sexuality and demanded an end to discrimination against homosexuals.

Despite political differences and conflicts within and among these groups—Susan Moller Okin asks *Is Multiculturalism Bad for Women?* (1999)—they share the common experience of suffering unequal treatment at the hands of historically privileged groups and officials. Many multiculturalists, including African American lesbian poet June Jordan, have placed their own disadvantages in a larger context and urged their followers to unite, even with sympathetic heterosexual white males, around the common cause of equal treatment and social justice. Much evidence, including opinion polls and the political careers of Barack Obama and Hillary Clinton, indicates that the attitudes of Americans have shifted significantly in favor of these groups' pleas for equal treatment.

Ecology

Since the 1960s, environmental scientists and activists have offered a startling critique of American, and indeed Western, civilization: namely, that its economic system of mass production and culture of consumption are spiritually debilitating and physically unsustainable. Inspired by pioneering environmentalists Aldo Leopold and Rachel Carson, the ecology movement not only has gained traction over the decades but also has, according to opinion polls, captured the support of most Americans for using public policy to protect the environment and for changing their own lifestyles in environmentally friendlier directions. The increasingly serious problem of climate change has accelerated the ecological cause in the United States and around the world. By the first decade of the twenty-first century, environmental groups were waging successful campaigns against business, labor, and consumerist interests in pressing governments to take action to prevent global warming and environmental catastrophes such as the massive oil spill in the Gulf of Mexico in 2010.

Youth Empowerment

The youngest of these new contenders is the ideology of youth rights and empowerment. In the 1970s, adult pioneers of youth voice and rights such as Richard Farson and John Holt began arguing that many young people had political preferences and that their preferences should count. Beginning in the 1990s, youth activists such as Craig and Marc Kielburger started taking up their own cause in the process challenging the exclusively adultist regime of power and authority. The Kielburgers helped found Free the Children, a child-run international human-rights organization focused on freeing indentured child laborers. The National Youth Rights Alliance began advocating for a wide range of youth rights by providing mechanisms for youth political participation and by opposing discrimination against the young as reflected in corporal punishment (legalized assault), censorship of school newspapers, dress codes, youth curfews, and youth disenfranchisement.

The political theory underlying children's rights and empowerment holds that under democracy, all citizens affected by public policy have the right to a voice in shaping it and holding leaders accountable. Arguments that minors are ignorant, irrational, or immature, youth advocates maintain, are

arbitrary and aristocratic rather than rational and democratic because they are not applied to the millions of ignorant, irrational, and immature American adults. These youth partisans provide telling examples of highly informed and articulate political activists under the age of eighteen.

Anarchism

Anarchism is a worldwide movement that has its ideological origins in the French Revolution, though the principles that inspire the political ideology are frequently identified in a range of earlier and not exclusively European schools of thought. Anarchism also describes a way of thinking or a set of attitudes, linking political movements narrowly understood, to creative currents in literature, science, the arts and humanities. Pierre-Joseph Proudhon was the first writer to use the term *anarchy* to describe his political ideal, knowing that it was already associated with chaos, social disorder, and violence. Anarchists have had cause to regret his decision ever since because for them, anarchy conjures images of precisely the opposite conditions; the familiar graffiti that places the A inside the O symbolizes the integral relationship they identify in anarchy and order.

One of the hallmarks of anarchism is the celebration of diversity and the reluctance on the part of many (though not all) to define its theoretical principles. Anarchists tend to be resistant to the idea that anarchism might be attached to one concept or ideal (e.g., the priority of liberty, classlessness), and their reluctance has encouraged a proliferation of labels within the movement. It is not unusual to find reference in anarchist literatures to social anarchism, anarcho-communism, anarcho-syndicalism, class-struggle anarchism, or anarcho-feminism, and sometimes more contentious forms such as market-anarchism or anarcho-capitalism. The ideological parameters of these different forms, their interrelationship and the definitional role that any might claim to have had in the construction of

the anarchist tradition, still generate considerable debate. In contemporary anarchism, these debates have been deepened by the appearance of two further currents. The first draws on poststructuralist thought to question anarchism's philosophical underpinnings and produce a new hybrid, postanarchism. The second instead focuses on the constraints of ideology and rejects anarchism in favor of post-left anarchy. Interestingly, since his relationship to anarchism is much disputed, Max Stirner has been identified as an influence on both.

The reluctance to identify anarchism with any particular political principle perhaps reflects deeply rooted historical suspicions about the theoretical implications of revolutionary Marxism, specifically, the idea that liberation might be reduced to a single goal: the abolition of individual ownership of the means of production. The claim that Michael Bakunin made against Marx in the course of their battles in the First International (1870–71) was that this formulation ignored other equally invidious forms of oppression rooted in religion, patriarchy, and concepts of race. In the other part, there is a particular concern about the association of anarchism with antistatism. This concern has a number of dimensions. One aspect is the fear that antistatism fails to provide a clear marker between socialist and right-libertarian currents of thought. Another key concern is that the principle wrongly focuses attention on institutional structures rather than on social relationships. The combined influence of the peace and ecology movements, of antiracist, feminist, and gay struggles on contemporary anarchist thought, particularly since 1968, has helped reorder this assumed priority. Gustav Landauer's conception of the state as a set of social relations, which can be effectively challenged by behavioral change, resonates in much modern anarchist writing, though Landauer's relationship to the anarchist movements in which he was involved is less well understood. Nevertheless, the idea that anarchism involves the rejection of the state is not only historically defensible, but also it provides a starting point for the discussion of anarchist ideas that is neither inherently reductive nor structurally biased.

The Rejection of the State

Anarchists have understood the state in different ways, but three approaches are recurrent in anarchist literatures. In the first, the state is understood sociologically, as a feature of the modern world linked to the centralization of political power, bureaucratization, and especially in Proudhon's work, the development of the international system. In the second, the state is associated with concepts of sovereignty, authority, and political obligation. The third approach is functional and defines the state as a system of domination, based on institutionalization of social, economic, and political inequalities. These different approaches are not mutually exclusive: the nineteenth-century anarchist Peter A. Kropotkin understood the state in all of these ways. Tracing its origins to the late Middle Ages in Europe, he argued that states were defined by the principle of government by command that infantilized, atomized, and brutalized individuals and that its purpose was to uphold the privileges of military, religious, and political elites. However, the weight that different anarchists attach to these aspects of the state affects both their critical assessments of it and their strategies for change. For example, the concern about the process of state formation maps to a general interest in institutional alternatives and a preference for decentralized federation, made manifest in particular experiments of syndicalist design, affinity group organization, and informal grassroots networking. The priority variously attached to independent judgment and acting in accordance with conscience has similarly promoted a range of practices and behaviors, from voluntary cooperation through mutual aid, consensus decision making, and the development of alternative pedagogies, to civil disobedience, direct action, and the creative transgression of moral norms. The critique of the state's function as the guarantor of minority interests also runs through anarchist writings. Anarchists have fundamental disagreements about the ways in which the inequalities of the state might best be tackled and vehemently dispute the role of markets and the status of private property in anarchy. Nevertheless, challenges to the state's function have inspired schemes for cooperative production, mutual exchange, and gift economies. The challenge has also been felt in *glocalism* (a term coined by Kropotkin's friend, Patrick Geddes) and in very different proposals for the integration of agriculture and industry, large-scale collectivization, and recently, the wholesale rejection of technology.

As critics of the state, anarchists have traditionally been identified within socialist circles by their rejection of parliamentarism, proletarian dictatorship, and the revolutionary vanguard. Historically, they always argued that it was impossible to disassociate the ends of revolutionary struggle from the means and that the seizure of power by an elite representative group, however temporary in or outside parliaments, will necessarily result in a transfer of power within the state rather than its abolition. The relationship between the ends and means of struggle is now captured in the idea of prefiguration, though there is some debate about the extent to which these ideas are actually synonymous. In the post–World War II period, some anarchists have insisted on a strong relationship to argue that prefigurative politics is necessarily nonviolent. Others have asserted a similarly strong link but instead justified revolutionary violence. Yet others, including postanarchists and adherents of post–left anarchy, have suggested a weaker relationship and argued that prefiguration describes a qualitatively different form of politics, not just the rejection of means-ends distinctions. This distinction, they argue, remains open to a naive utopianism: the notion of revolutionary change as a moment of transition, leading from the old world to the new, the recovery of natural behaviors, and to life lived happily and harmoniously ever after. In contrast, prefiguration is about dynamic process, the embrace of contestation, incommensurable difference, and plurality. Yet however the relationship is treated, there is general agreement that prefiguration captures a distinctively anarchist desire to initiate change in the present and through grassroots activity in everyday life. The degrees to which individuals and groups can cooperate, resolve, or ignore their differences and take control of their own affairs and arrangements is widely held to be an expression of anarchy in action or do-it-yourself politics and part of a process of continuous change, development, and resistance.

Clarifying Concepts

While anarchist antistatism has importantly shaped ideas about change, it has also presented problems for the analysis of anarchist ideas. Anarchism, as Rudolf Rocker famously claimed, is sometimes said to borrow from both liberal and socialist traditions. Yet anarchists tend to diverge from mainstream liberal traditions just as they do from dominant Marxist

currents of socialist thought. This divergence presents particular challenges in theory and sometimes results in seeming contradictions in anarchist thinking. For example, Bakunin both declared himself a fanatical lover of liberty and denied the possibility of achieving absolute liberty. In some cases, the confusion is easily explained. Bakunin qualified his rejection of authority as command by distinguishing it from a conception of authority as advice: being in authority was not the same as being an authority. In others, the problem is more difficult to resolve. When it comes to liberty, some analysts have attempted to interrogate the anarchist conception through the lens of positive and negative freedom. The results are often unsatisfactory because both constructions assume the very condition that the anarchist wants to reject: the state. Conceptions of individual–community relations are dogged by a similar problem. Although anarchists share liberal concerns about individuality, their theoretical paradigms are not typically shaped by an idea of necessary limits to freedom but by concepts of solidarity, cooperation, or in the case of Stirnerite egoists, unity. Anarchist writers have certainly engaged with other philosophical traditions but have tended to develop critical frameworks of their own. The contrast is probably most apparent in international relations theory, where anarchists take issue with the central concept of international anarchy.

Understanding anarchist thought consequently demands a particular sensitivity to context and the languages of debate. It also requires sensitivity to the ways in which anarchists have typically engaged in political argument. In the history of ideas and in studies of political ideology, anarchism has come to be identified with a canon. Unsurprisingly, the membership is open to debate: Proudhon, Bakunin, and Kropotkin are regularly identified as central figures within it; Benjamin Tucker, Leo Tolstoy, and Stirner feature intermittently as does William Godwin. Of the twentieth-century contributors, Emma Goldman, Alexander Berkman, and Nestor Makhno loom large, and from the post–World War II generation, Murray Bookchin, Colin Ward, Paul Goodman, and Alex Comfort are among the most celebrated. Today, the works of Noam Chomsky, John Zerzan, Hakim Bey, and Cindy Milstein are likely to appear on many anarchist reading lists. But questions of inclusion and exclusion are not so burning an issue in anarchist discussions of anarchist traditions as the primary division between theory and practice that the construction of the

canon implies. Ironically, since most of the key writers who feature in the canon were (and are) themselves activists, this concern can seem misplaced. Nevertheless, the point that most anarchist writers would wish to make about anarchism is that it cannot be understood solely through the work of its scholarly, philosophical exponents; that the languages of debate are those of activists not academics; and that to assess the former by the standards of the latter is to misunderstand and risk misrepresenting anarchist ideas.

The antitheoretical bias of anarchism is sometimes badly overstated. Anarchism's apparently parasitical relationship to Marxism and the claim that anarchists have served as the passionate heart to the Marxists' rational head is one unfortunate result. However, the bias begs legitimate questions about anarchism's contribution to political thought. First is the distinctive critique of the state: the reminder that the modern state is just one possible and very recent system of political organization—that its failings to tackle injustice and degradation are design faults not merely the result of governmental abuse or corruption. Second is the richness of the anarchist's political vision, the utopian commitment to alternative ways of being, and the practical concern to encourage creative experimentation in ethics and social life. Third is the desire to articulate and disseminate these ideas as common sense in ways that can be realized by ordinary people.

Animal Rights

The idea of according rights to animals dates to at least the eighteenth century, but only since the 1970s has it become an important branch of applied ethics. This growing academic interest was accompanied—in Britain, Europe, and the United States in particular—by the emergence of an animal rights movement that has now become an established part of the social movement scene. There is now a considerable body of legislation regulating the treatment of animals, and the ways in which humans treat them—as experimental subjects and sources of food in particular—often provoke heated public debate. Moreover, the tactics of some animal rights activists has raised questions of public order and the legitimacy of direct action.

The debate about animal rights, however, has been largely neglected by political theorists most of whom, while accepting that we owe some moral obligations to animals, reject the idea that their moral status is such that it makes sense to use the language of rights in their defense. As a result, political theorists have not, by and large, engaged in a discussion about the impact the moral consideration of animals might have on political concepts such as justice, freedom, and democracy.

History

Legislation regulating the use of animals has existed since the nineteenth century. Although this legislation challenged the previously dominant view that we owed no direct moral obligations to animals, what it does not do is to challenge the widespread perception that they have an inferior moral status to humans. There were nineteenth-century challenges to this position, the work of the Victorian thinker and activist Henry Salt being the most notable example. It was not until the latter quarter of the twentieth century, however, that—under the guise of animal rights—the claim of the moral inferiority of animals came under sustained scrutiny. Indeed, academic philosophers have written more on animal rights in the last thirty years or so than in the previous 250 years.

The intellectual origins of the animal rights movement have a distinct Oxford connection. In 1972, three Oxford philosophers—Roslind and Stanley Godlovitch and John Harris—edited a set of articles published as *Animals, Men and Morals*. Peter Singer (an Oxford-educated Australian academic) reviewed this volume in the *New York Review of Books*, and this review formed the basis of his own *Animal Liberation* published in the mid-1970s. As we shall see, Singer bases his case for an elevated moral status for animals on utilitarian grounds. Others sought to articulate a case for treating animals, along with humans, as beings who are holders of rights, including Richard Ryder, Andrew Linzey, and Stephen Clark (all with Oxford connections) as well as the American philosopher Tom Regan whose lengthy and sophisticated book *The Case for Animal Rights*, published in 1984, has earned him a formidable reputation within the animal rights movement and beyond. Since the 1980s, a second generation of animal ethicists has emerged, some who have built upon previous themes while others have taken animal rights in different directions.

Humans, Animals, and Moral Status

According rights to animals necessitates establishing that they have a moral status that is on a par, at least in some respects, with humans. Until the nineteenth century, it was common in theory and practice to regard animals as having no moral standing whatsoever so that we owed no moral obligations to them directly. By the end of the nineteenth century, it was accepted widely that animals are sentient, having the capacity to experience

pleasure and pain, and that we owe at least something to them directly. This insight led to the establishment of the concept of animal welfare that now constitutes the moral orthodoxy, at least in the developed world. Its central feature is an insistence that humans are morally superior to animals but that since animals have some moral worth, we are not entitled to inflict suffering on them if the human benefit thereby resulting is not necessary. Sacrificing the interests of animals for the aggregative welfare, then, is permissible providing that the benefit is significant enough, but treating humans in the same way is prohibited whatever the benefits that might accrue from so doing.

Philosophers advocating animal rights, broadly construed, have sought to challenge the animal welfare ethic. Animal welfare is based upon demonstrating that humans are different from animals in morally significant ways. In particular, it is argued that humans possess a collection of mental characteristics—autonomy, memory, a language, and agency—that together constitutes personhood. Persons, it is said, can be harmed in much more fundamental ways than nonpersons and have lives that are qualitatively more worthwhile. As a result, it is morally permissible to sacrifice the interests animals have in not suffering in order to defend the much more profound interests humans have.

Philosophers advocating animal rights have three major responses to the personhood argument. First, it has been suggested that at least some animals do possess elements of personhood. In response to this claim, defenders of the moral orthodoxy have argued that even the most intellectually able animals do not have the characteristics of personhood to the same degree as the average normal adult human. As a result, animals will always lose out in a direct application of the personhood argument, if the personhood argument is applied without any further adaptation.

One such adaptation provides the second response to the personhood argument: the assertion that not all humans are persons. Thus, in the so-called argument from marginal cases, it is asked if we persist in justifying the exploitation of animals on the grounds that they are cognitively less able than humans, then what should we do with those humans—the seriously mentally disabled in particular—who do not themselves have the

characteristics of personhood? Consistency would seem to demand that we either exploit human mental defectives as well as animals or we exploit neither animals nor marginal humans. The argument from marginal cases has produced a burgeoning literature, by no means a majority supportive of the position, but without a decisive blow being made against it.

The third response to the personhood argument is the claim that the mere fact that animals are sentient ought to result in animals being accorded a higher moral status than the animal welfare ethic allows. In other words, even if we accept that humans are persons and animals are not, it does not follow that the same inequality between humans and animals applies to the issue of sentience. Considering human and animal interests in not suffering equally, it is argued, would have important implications for the way that the latter are currently treated.

Rights and Moral Status

Establishing that animals have a moral status that is higher than the orthodox welfare position allows is a necessary condition for the application of rights to animals. It is not, however, sufficient. For there are those who would agree that animals are worthy of a high moral status but that the concept of rights is not the best way of theorizing this elevated moral status for them. Two alternative approaches are particularly worth mentioning.

First, there is the utilitarian approach associated in particular with Singer. He suggests that we ought to treat like interests alike (the equal consideration of interests), and since at least some animals are sentient, it is morally illegitimate to always prioritize human interests in not suffering. To determine how we should act in any particular situation, Singer argues, we should engage in a cost-benefit analysis, weighing up the satisfying of preferences or interests involved.

Some have argued that Singer's position is a version of animal welfare and therefore lacks the radicalism of animal rights. It is true that Singer, all things being equal, does seem to regard animal life as less important morally than human life. As we shall see below, however, many advocates

of animal rights share this perception. The key point here is that Singer, as a utilitarian, does not attach rights to either humans or animals. Rather, a morally correct action is one that maximizes pleasures or preferences. For Singer, though, to prioritize human interests in the way that the animal welfare ethic does is speciesist because it is basing moral superiority on species membership rather than on a morally relevant characteristic. That is, present practices have an in-built assumption that nontrivial human interests are not to be counted as part of the utilitarian calculation but merely defended whatever the cost to animals.

Singer argues that most current uses of animals—including their use as experimental subjects and as sources of food—are not justified on utilitarian grounds. His work is not immune, however, from the general criticism of utilitarianism's aggregative principle. For example, the aggregative character of utilitarianism makes it debatable, to say the least, whether vegetarianism can be justified on utilitarian grounds. Such a justification would require the balancing of pains and pleasures or preference satisfactions and therefore meat eating is not ruled out of court as it is if we grant to animals a right to life. Indeed, it is possible to provide an imposing list of the consequences of an end to animal agriculture—from the direct loss of jobs in the farming and food industries to incidental effects in a number of other industries—that have to be weighed against the suffering inflicted on animals.

The second challenge to the rights approach to animal ethics comes from feminism. Feminist advocates for animals argue that an approach based on care is a more effective way of protecting animals than one based on traditional rights, or indeed utilitarian, theories of justice. Advocates of a care ethic criticize justice-based animal ethics (as exemplified by those such as Regan and Singer) for its reliance on arguments based upon rationality, logical consistency, universality, fairness and competitive adversarial relationships, and its apparent eschewing of emotion. Instead, this discourse should be replaced, it is argued, by a care ethic that privileges essentially female values such as compassion, empathy, sympathy, and context.

The care-based critique of justice is problematic on a number of levels. Not only does it exaggerate the dichotomy between rationalism, on the one

hand, and emotion or sentiency, on the other, but it also provides little guide as to how we would universalize an individual experience (of, for example, the treatment of animals in a slaughterhouse) to appeal to those who have not had that particular experience. Moreover, there is a lack of empirical evidence for the claim, made by advocates of a care ethic, that there is a close link between sympathy and compassion and a tendency to act upon animal suffering.

As well as the debate between advocates of rights and alternative approaches, rights advocates themselves disagree over what constitutes the basis for according rights to animals. Some suggest that rights can be granted to animals merely on the grounds that they are sentient. Others argue that it is the cognitive capacities of animals that are the key to their status as rights holders. For example, Regan, as an exponent of the latter, seeks to show that at least some animals are what he calls subjects-of-a-life, possessing enough mental complexity to be morally considerable. Because at least some animals have these capabilities, Regan argues, they have a welfare that is capable of being harmed by not only inflictions of pain and deprivation, but also death since it forecloses all possibilities of finding satisfaction in life.

In order to circumvent the apparently subjective nature of rights' claims, Mark Rowlands seeks to develop a contractarian account. Here, the rights of animals are derived, supposedly objectively, from the incorporation of their interests into a Rawlsian social contract. This approach, while ingenious, falls down to some extent because John Rawls derives principles of justice not only from what he argues individuals would choose in the original position behind a veil of ignorance but also from his interpretation of moral intuition.

What Rights?

Some of the most interesting contemporary work on animal rights has focused more specifically on the content of the rights animals can be said to possess. Answers to these questions, in turn, have crucial consequences for what it is legitimate morally to do to animals. The debate has focused on

whether or not animals can be said to possess a right to life and a right to freedom.

In terms of the former, there is a consensus among proanimal philosophers that human life is more valuable than animal life. Even Regan, who does attach a right to life to mammals over the age of one, claims that in the event of a choice between saving the life of a human and the life of an animal, the human would normally win out. The reason for the greater value placed on human life relates to the harm caused by death, either in terms of denying a desire to stay alive or in terms of the loss of opportunities that death will foreclose. In both cases, it is widely argued, the loss to humans is greater because we possess the characteristics of personhood.

The insight about the respective value of human and animal lives raises a question mark against according to animals a right to life. Similar arguments might be used to deny animals a right to liberty. One interpretation, suggested by Alasdair Cochrane, would be that because humans are autonomous, liberty is intrinsically valuable to us. That is, it is valuable irrespective of the benefits—such as avoidance of frustration—that derive from it. For animals, on the other hand, liberty is valuable precisely because of the goods deriving from it. As a result, liberty is a means to the end of the achievement of other goals, whereas for humans it is intrinsically valuable. Liberty may therefore be beneficial to animals but only when it has, say, the effect of alleviating suffering.

It is a commonplace to assume that the animal rights position is opposed to the use of animals because to use animals is to deprive them of liberty and more often than not, life. It is for this reason that the condition of animals is often equated in the animal rights literature with human slavery. It is for this reason too that animal rights is held by some to be inconsistent with their ownership by humans. Thus, only when animals are liberated from human use can the rights position be achieved. This argument does not apply, however, if it is contended that animals do not possess a right to life or liberty. The effect here is to focus attention on the treatment of animals and not their use per se. It raises the possibility that it is morally wrong to

infringe an animal's right not to suffer but morally legitimate still to use them and even kill them, providing it is done painlessly.

Apartheid

South Africa was governed according to the ideology of apartheid (apartness) from 1948 to 1993. Apartheid's roots lie in the Boer War between the United Kingdom and Afrikaners (descendants of Dutch settlers in present-day South Africa). British-led modernization after their victory saw Afrikaners urbanized. In the cities, they encountered poverty and Anglo-racism. Further, Britain's Governor-General, Alfred Milner, tried to Anglicize Afrikaners. Backlashes against Anglicization and poverty produced Afrikaner nationalism, which named itself Christian nationalism. These antiimperialist nationalists wanted to replace British rule with an Afrikaner republic. During the 1930s and 1940s, intellectuals concerned about growing Afrikaner poverty formulated the apartheid idea. These intellectuals were Daniel Malan, P. J. Meyer, Hendrik Verwoerd, Werner Eiselen, Nic Olivier, Geoffrey Cronje, Nico Diederichs, E. G. Jansen, Barney van Eeden, P. J. Schoeman, P. J. Coertze, and F. J. Language.

Diederichs laid the theoretical foundations of Christian nationalism—an idea infused with the Dutch *verzuiling* (pillarization) logic of Calvinist theologian Abraham Kuyper. Diederichs argued nations had a God-ordained right to exist as separate entities. Hence, Afrikaners had the right to exist as a separate nation, refuse Anglo-assimilation, and refuse a British-designed South Africa that lumped Afrikaners (as a minority) in with other ethnic groups. Cronje added the idea that Afrikaners needed to build their own cultural-political space separate from Anglos, blacks, coloreds, and Indians. He argued the alternative to own-ness (*eiesoortigheid*) was that Afrikaans

culture would be swamped by a combination of Anglo cultural imperialism and huge numbers of black migrants being imported by Anglo-capitalists (whose profit drive threw people together “who did not belong together”). The solution was deemed to be apartheid—the political partition of South Africa into separate ethnically defined states, which facilitated Afrikaners becoming a demographic majority within their own independent state. From this grew the National Party (NP), geared to implement partition and deconstruct the British-made South African state. The NP saw apartheid as an alternative to the following:

A unified multiracial state governed by white supremacy and segregation, favored by Jan Smut’s United Party.

A unified state governed by universal suffrage, favored by the African National Congress (ANC).

Three Phases of Apartheid

From 1948 to 1957, the NP emphasized the establishment of Afrikaner sovereignty plus the creation of own-ness and own cultural spaces through the following:

Own-language education. Separate English and Afrikaner schools, colleges, and universities were established. Nine black languages were codified and used in a newly established black education system (Bantu Education).

Legally defining ethnic population groups to create the basis for partition.

Clearing multiracial slums and moving inhabitants into separate black, colored, Indian, and white townships.

Deploying affirmative action to upgrade poor Afrikaners.

From 1958 to 1977, apartheid’s social engineers implemented a program of internal decolonization (called separate development) involving the following:

Establishing nine self-governing black states called homelands (Bantustans).

Blacks becoming citizens of these homelands, losing their South African citizenship when homelands were granted independence. Blacks were granted political rights in the homelands and refused political rights in white South Africa.

A migration control system (pass laws) forcibly removing many blacks from white South Africa to homelands (to achieve an Afrikaner demographic majority in the white Republic).

Reducing economic integration between whites and blacks by relocating industrial zones to homeland border areas.

Separate development (political partition) was called grand apartheid to differentiate it from petty apartheid (segregation).

From 1978 to 1993, the idea of full political partition was abandoned as unimplementable and replaced with Arend Lijphart's consociational model, involving a (multirace, three chamber) Tricameral Parliament and Constellation of States. The tricameral reforms generated a sustained revolt (led by the United Democratic Front), which militarized the apartheid state and produced an era of political violence that brought about apartheid's downfall.

Five Interpretations of Apartheid

Because of the difficulties of explaining the complexities of apartheid policies to non-South Africans, apartheid is often understood in simplistic and reductionist terms. However, because it was opposed by both liberals and socialists (for different reasons), apartheid became widely reviled and routinely condemned, although there is no common agreement as to what apartheid was or why it was bad. A reading of all the literature on apartheid reveals five broad interpretations:

1. Apartheid equals segregation. A view common in the United States where apartheid is equated with segregation in U.S. southern states.
2. In 1973, the United Nations General Assembly declared apartheid a (racist) crime against humanity. This resolution was supported by the Soviet bloc and Afro-Asian bloc but not ratified by West European states, the United States, and Canada. The ANC frequently deploys this thesis.

3. Liberals see apartheid as an antiliberal policy of state interference that distorts market forces and increases labor costs.
4. Marxists see apartheid as a variant of capitalism (termed racial capitalism) characterized by class exploitation and white privilege.
5. Afrikaner nationalists see apartheid as a survival plan designed by a minority group concerned with the political-cultural implications of majoritarian democracy.

Arab Nationalism

There are various ways to define Arab nationalism and to study political identities in the Arab world. Arab nationalism denotes those political movements that emerged in the nineteenth century and crystallized in the twentieth century, which called for the political unification of the Arabs. The movement went through different phases and acquired many forms over time. But the goal of Arab nationalists has remained unchanged: they seek to break down the twentieth-century borders between Arab states, borders that are seen as the artificial creation of colonialism, and to create an all-encompassing Arab united state.

History

One can trace Arab nationalism back to early Jahili (pre-Islamic poetry) and to early associations between the Arabs and the rise of Islam. The Arab people, or the people of Arabia, have long taken pride in their history and in their tribal lineage. The rise of Islam among the Arabs, the fact that Muhammad (570–632 C.E.) was an Arab, and the fact that Muslims believe that the Qur'an (the holy book for Muslims) was revealed in the Arabic language all gave impetus to Arab national pride of sorts. The Qur'an is, for Muslims, the word of God, literally, and the word of God is in the Arab language. References by Muhammad to "my *ummah*" was understood by Arabs to mean them in particular. The language of the Qur'an cemented the unity of the Arabs, who can read and understand the holy book, regardless

of the various regional accents. The construction of Arabic grammar uses the Qur'an as the model of the correct or perfect Arabic language. Non-Muslim Arabs struggled in vain throughout Islamic history to attain the status of Arab Muslim pride, but Arabs felt superior if only because Muhammad was born to an authentic Arab tribe.

It is true that Islam created what one Orientalist, W. Montgomery Watt, called a super tribe. The super tribe of Muslims, or the Islamic ummah, was supposed to subsume under it, or within it, all other ethnic or social tribes. The ummah was supposed to erase all lines of racial, ethnic, and tribal demarcation, but Arabs could not accord to non-Arabs the same status of prestige that Arabs felt that they deserved.

It is fair to say that there have always been in Islamic history expressions of literary Arab nationalism: various writers spoke of the greatness of Arabs and compared them favorably to non-Arabs (Muslims). But various non-Arab dynasties such as the Ikhshids, Buwahids, and Mongols (even before the rise of the Ottomans) ruled over Arabs and did not take kindly to Arab attitudes of superiority. But the Arabs were humbled by their years and decades of obedience to non-Arab dynasties. Arab nationalist expressions were, so to say, dormant if only because the idea of nationalism was rather unknown.

Early Arab Nationalism

Most histories of Arab nationalism agree that the nineteenth century witnessed the advent of the embryonic form of Arab nationalism. Turkey witnessed the rise of Turkish nationalism, which undermined the Islamic sources of legitimacy for the Ottoman Empire in Muslim lands. Educated Arabs began to organize first in scientific and literary societies and later in broad political movements. Writers were educated at Western institutions and learned about nationalist movements in different parts of the world. And the more Arabs learned of Turkish nationalist sentiment, the more they felt left out. The national recipe of the Ottoman Empire had no room for them. In some ways, the Arab nationalist movement began as an anti-Turkish movement, but it was an expression of the popular yearning for freedom.

The expressions of Arab nationalism were not fully formed at that time. Arabs merely relied on a rich heritage to mobilize the Arabs behind idea of political solidarity. There were links between those early Arab nationalists and Western governments eager to take advantage of the common resentment against the Ottoman Turks. France and Britain were more than happy to shower Arabs with promises of independence in return for support of the anti-Turkish war efforts during World War I.

This was the era of the Husayn-McMahon correspondence (the correspondence between the chief British diplomat and the Arab king of Hijaz entailing a political transaction that was understood by the Arabs—and by most historians—to include Arab independence in the wake of the fall of the Ottoman Empire; some historians still quibble over the exact meaning of different phrases in the text of those letters). The British officially promised to grant Arab independence in return for Arab war effort against the Turks. The rest is part of history: Arabs were unaware that the British had already committed themselves not only to the Balfour Declaration but also to the Sykes-Picot agreement. Sharif Husayn aroused excitement among Arabs: there was a chance—they thought—for the restoration of Arab rule. But all those hopes were dashed with the establishment of the Mandate system in the Arab East and with the crushing of the Faysal government in Damsacus.

Political Arab Nationalism

It would be fair to say that Arab nationalism expanded not only after the creation of the state of Israel, which Arabs saw as a threat to all Arabs, but also after the 1952 coup by Gamal Abdel Nasser in Egypt. Nasser, who led Egypt from 1952 to 1970, has become the symbol of Arab nationalism. He is credited not only with popularizing the idea of Arab nationalism but also with putting into place concrete plans for unifying the Arabs—all the Arabs. From 1958 to 1961, Syria and Egypt were united in what was called the United Arab Republic. The United Arab Republic inflamed Arab public passions and intensified hopes for a larger all-encompassing Arab state.

Nasserism and later the Ba'ath Party defined the modern understanding of political Arab nationalism. It became centered around key goals: the

establishment of an all-encompassing Arab state, the elimination of the borders between Arab states, the redistribution of income and the promotion of an ill-defined Arab version of socialism, the unification of all Arab people behind one political banner that would achieve economic and political independence, and the liberation of Palestine.

Nasser did not, however, go far with his successes. The United Arab Republic ended in a disaster: the heavy-handed Egyptian rule in Syria resulted in a coup that separated Syria from Egypt. The bitter experience hurt Nasser and undermined the promise of the extension of the United Arab Emirates (UAE) into other countries. It also left Nasser open to the charge that his regime did not transcend the narrow form of Egyptian nationalism, which left the Syrian people embittered. The UAE basically revealed the challenge facing Arab nationalist forces: the conflict between two forms of nationalism in the Arab world.

In the Arab world, people find themselves within multiple concentric circles of nationalism. Primarily, the individual may gravitate toward the Arab nationalist identity while all Arab regimes (except Nasser and the Ba'ath in their early years only) force on the citizen the narrow form of identity, known as *wataniyyah* nationalism, or nationalism within the narrow confines of the state, as opposed to *qawimiyyah* nationalism, or Arab nationalism that wishes to eliminate the very existence of the small states that were designed by Western colonial powers.

But the failure of the UAE project did not in any way end the quest for Arab unity: there followed various attempts at Arab unity between different regimes, but none were serious enough to warrant scholarly consideration or to excite public opinion. However, the era of the 1950s and 1960s witnessed the proliferation of Arab nationalist groups. The Movement of Arab Nationalists, led by George Habash, is the most important modern Arab nationalist political party. While it was sponsored by the Nasserist regime and it received support from Nasser, it had an important impact on contemporary Arab political rhetoric. It was through the Movement of Arab Nationalists that the Palestinian masses were inculcated with the idea of Arab nationalism. And the various Palestinian resistance organizations that

were born before and after the 1967 war with Israel all incorporated ideas of Arab nationalism in their ideologies.

The Ba'ath Party came out in the 1940s from a climate of Arab nationalist fever. The party founded by Michel 'Aflaw and Salah Al-Bitar promised a revival of the Arab renaissance and sought to unite all Arabs. But the dilemma of the Ba'ath Party exhibited the weaknesses in Arab nationalist movements: the party splintered into various factions, different factions ruled over Syria and Iraq, and they engaged in bitter wars that lasted for decades. Furthermore, the Ba'ath, which promised to unite all Arabs, engaged in a bitter feud with Nasser, the embodiment of Arab nationalist ideas for most Arabs at the time. And the party established ruthless, brutal regimes in Syria and Iraq, regimes that made their version of Arab nationalist ideology unappealing.

The death of Nasser in 1970 and the attempt by the Ba'ath parties to monopolize the representation of Arab nationalist ideas dealt a severe blow to Arab nationalism. But the notion that Arab nationalism died with Nasser is fallacious. There is still evidence of the persistence of the Arab nationalist ideas throughout the Arab world. Arab nationalism is still alive insofar as most Arabs still identify (according to various public opinion polls) with the same goals of resisting Israel and uniting the Arabs and sharing a political identity deeply rooted in the long history of the Arab people. Moreover, the proliferation of Arab satellite channels since the 1990s crystallized the formation of an Arab cultural and political personality. All Arabs seem to gravitate toward the same themes and political values, although it would be a mistake to treat all Arabs as a monolithic bloc. While a multiplicity of Arab political parties continues to capture the imagination of the Arab people, and although there is a conflict in the region between secular and fundamentalist trends, Arabs still share common identities and yearnings for more political unity.

The rise of Islamic fundamentalism posed a challenge to Arab nationalism: Islam posits a form of identity that transcends (in theory) all other forms of political, racial, tribal, and national identities. And Islamic fundamentalism was opposed to the political forms of Arab nationalism because they were largely secular: Arab nationalism calls for citizenship that does not

differentiate between an Arab and another and that does not give an advantage to Muslims over non-Muslims. Because they suffered persecution under Nasser, fundamentalists were also affected in their evaluation of Arab nationalism by the Nasserist experience. But even Islamic fundamentalists in the twenty-first century agree that there is such a thing as an Arab nation (*ummah*) and that such references appear in Islamist rhetoric.

The Arab world has been undergoing political transformation: the so-called Arab Spring continues, and appears destined to continue and to change the political landscape of the region. But something about the Arab Spring gives credence to the assumptions of Arab nationalists: why did all Arab uprisings coincide? And why did they all chant the same slogans, and why were all Arabs galvanized by the Tunisian and Egyptian uprisings? Furthermore, Arab uprisings were watched by Arabs on pan-Arab channels and on Arab social media.

Arab nationalism is not only an ideology; it has become a mass sentiment. The Arab people are becoming more aware than ever of their commonality and shared political values. It is true that Arab nationalism was a mass movement from below that was fought from above (by regimes) and by Western powers. The ideas received a big boost when they were championed and promoted by Nasser, the most popular Arab leader of the twentieth century. Obituaries of Arab nationalism have been premature: it is likely that this will be a movement that will last through another century.

Arendt, Hannah

Hannah Arendt's political thought was the product of two worlds and of the events that carried her from one to the other: the Germany of the first few decades of the twentieth century in which she received her formal education and began writing, and the United States of the World War II and Cold War eras, where Arendt sought refuge from Nazism and became a widely published author and commentator. Arendt was born in 1906 in Hanover, Germany; her parents came from prominent Jewish families in Königsberg, the capital of East Prussia, today the Russian Kaliningrad. The young family moved there when Arendt's father became incurably ill. A conflict with a teacher led to Arendt's expulsion from high school at fifteen, and her mother arranged for her to go to Berlin, the capital of the new German Weimar Republic and center of its vibrant but conflictual cultural and political scene, to audit courses at the university. After two semesters, Arendt passed her high school examinations and in 1924, enrolled at the University of Marburg. She was drawn there by the reputation of the young professor Martin Heidegger, who had attracted a large student following by proposing a radical critique of the staid tradition of philosophy. Arendt studied philosophy, Protestant theology, and Greek philology, or classics and famously had a romantic relationship with Heidegger, who would subsequently join the National Socialist, or Nazi, party and cooperate actively during its first year in power. Arendt did not complete her studies with Heidegger; she wrote her doctoral dissertation—a philosophical study of a theological topic, the concept of love in the writings of St. Augustine—

at the University of Heidelberg under the supervision of the philosopher Karl Jaspers.

Between the completion of her studies in 1928 and her eventual flight from Germany, Arendt was active as a journalist and, increasingly, in activities of the Zionistische Vereinigung für Deutschland, or Zionist Federation of Germany. Arendt was critical of the Zionists' focus on emigration to Palestine as the only viable response to the predicament of European and German Jews, but she welcomed their opposition to the liberal Jewish establishment's continued pursuit of assimilation in the face of growing German anti-Semitism. After the Nazi takeover in early 1933, Arendt helped the Zionist Federation prepare for the upcoming World Zionist Congress by collecting evidence in the Prussian State Library of the increasingly widespread anti-Semitism in German civil society. She was caught and arrested; released after eight days, Arendt promptly left Germany, escaping over the border to Czechoslovakia and becoming stateless, a category of person whose coming explosion Arendt would analyze in the work that made her famous almost twenty years later, *The Origins of Totalitarianism*.

Arendt made her way to Paris, where she worked for several organizations and served as the general secretary of the Paris branch of Youth Aliya. She aided Jewish refugees and supported emigration to Palestine, especially for refugee children. In 1936, Arendt met her second husband, Heinrich Blücher, a self-taught political activist and member of the German Communist Party, who had participated in the attempt to found a workers' republic at the end of World War I and fled Germany after the Nazis began imprisoning their political opponents. When Germany invaded France in 1940, Arendt and Blücher were sent to internment camps for enemy aliens, but France was shortly defeated and Arendt took advantage of the ensuing chaos to leave the camp, whose internees were later transported to Auschwitz. Arendt, Blücher, and Arendt's mother managed to obtain American emergency visas and sail for New York, where Arendt and Blücher arrived in May 1941.

During the remainder of the war, Arendt wrote columns for *Aufbau*, a German-language newspaper founded by Jewish refugees; in them, she

urged the formation of a Jewish army and proposed alternatives to the positions that came to dominate discussions of the future of Palestine, opposing the creation of a Jewish state and warning against a failure to come to an understanding with the Arab coinhabitants of this land. Between 1944 and 1952, Arendt directed the Commission on European Jewish Cultural Reconstruction and its successor organization, overseeing the vast effort to locate surviving books and other cultural and spiritual treasures and either return them or place them with Jewish institutions. She also served for several years as senior editor at Schocken Books, the former Berlin publishing house that had been reestablished in New York. By now Arendt was contributing articles to various English-language publications, including *Partisan Review*, *The Nation*, and a number of Jewish journals including *Commentary*. She was also working on *The Origins of Totalitarianism*, a sweeping study of the elements that had crystallized in the political catastrophe of the mid-twentieth century. Upon its publication in 1951, Arendt was featured on the cover of the *Saturday Review of Literature*; she had become a public intellectual in her new home.

Writings

Arendt's thought was initially formed by the philosophical and theological experimentation of the years of the German Weimar Republic, but it quickly became concerned with political questions in the face of the increasing paralysis of Weimar political institutions and the rise of the National Socialist movement, which brought an end to the Republic in 1933 and commenced the official persecution, exclusion, and eventually annihilation of German Jews. In *Love and Saint Augustine*, Arendt first explored the difficulties the Western self has had in engaging in encounters with others in the world through her investigation of the relevance of the neighbor to Augustine's concept of love ([1929] 2006). In writings that followed, Arendt tied this problem to the emergence of the total state, which found one of its realizations in the Nazi party's takeover of the state apparatus. In *The Origins of Totalitarianism*, Arendt analyzed the concentration and extermination camps as the apotheosis of this phenomenon and its aspiration to total rule through the elimination of all difference between human beings, an aspiration that could only have the result of total domination. Arendt labeled this destruction of politics *totalitarianism*,

giving it a meaning unique to her usage and linking Nazism and Soviet Bolshevism under Joseph Stalin as two variations on a European and global theme. Her rejection of any aspiration to a supposed autonomous politics that would not take the form of ongoing political encounter with difference also shaped her account of the history and development of modern European anti-Semitism. In the early 1930s, while still in Germany, Arendt had completed most of another book exploring the history of this problem through the life of *Rahel Varnhagen*, a German Jewish woman (1771–1833) who like many of her contemporaries had sought refuge from her uncertain public status in recognition paid to her in the seemingly more open circles of society; in this book, finally published in the late 1950s, Arendt connected this turning inward to the cultural phenomenon of German romanticism and its elevation of the self above all concern with the world.

Arendt's *The Human Condition* ([1958] 1998) contains the celebration of political action that is one of the signal features of her thought. In this book, as well as in her collection of exercises in political thought titled *Between Past and Future*, first published in 1961, and in *On Revolution* (1963), Arendt developed the central terms of her political theory and its confrontation with the tradition of Western political philosophy, which had consistently viewed politics as something to be overcome through a singular, correct vision. In these works, Arendt conceives politics as taking place through the inhabitation of a common world that makes possible encounter across infinite, fluid lines of differences and the varying points of view that they enable. There is thus no politics without the political condition that Arendt calls plurality: "The fact that men, not Man, live on the earth and inhabit the world" (Arendt [1958] 1998, 7). Through politics, given differences between human beings can be experienced not as mere differentiation but as plurality that can be received and negotiated. New political beginnings are possible because plural beings can act into this world with each other—as long as they do not either succumb to that temptation of preoccupation with oneself that Arendt calls world alienation or find themselves forcibly alienated from the world by regimes, such as those she identified as totalitarian, that seek to realize their own rule by destroying politics. Politics manifests itself as "freedom," "the possibility to call something into being which did not exist before" and that could not have been known before it arose (Arendt [1961] 1977, 151); that freedom

can be hoped for, that politics is possible, is grounded in “natality,” the condition of “new beginning inherent in birth [which] can make itself felt in the world . . . because the newcomer possesses the capacity of beginning something anew, that is, of acting” (Arendt [1958] 1998, 9). Freedom is a phenomenon that appears in public, in the “space of appearance” that arises whenever, and as long as, people engage in action with others. Political power too arises, fleetingly, in such “action in concert,” and it cannot outlast such action; it is the very opposite of violence and the “domination of man over man” with which it is often identified. Politics, as Arendt understands it, is also at odds with other phenomena that are often mistakenly identified with it but actually have the effect of displacing politics: sovereignty, for example, and rule, whose triumph in the tradition of political philosophy entailed a disavowal of “the original interdependence of action” and the loss of the understanding of human freedom (Arendt [1958] 1998, 189, 225). Arendt sought to escape that impasse by reconceiving political authority as generated in the very act of political founding and the binding back to that beginning that occurs through ongoing political action; from this understanding, a successful political revolution cannot be founded on violence but on only the foundation of freedom that arises in the constitution of a stable and lasting political order through maintenance of an orientation to the world and each other in which entirely new beginnings can continue to occur and to be received as such, with regularity.

When Arendt died of a heart attack in 1975, her typewriter held the first page of “Judging,” which was to have been the third and final part of her last major work, *The Life of the Mind*. In its first two parts, published from her lecture manuscripts, Arendt had examined the faculties of “Thinking” and “Willing,” returning to the mental activities associated with the philosophical tradition she had rejected to suggest an alternative genealogy in which these activities do not involve a refusal of the manifold world. Much effort has gone into piecing together the argument the third part might have contained, for Arendt had indicated that she considered judgment to be the most political of the activities of the mind—on the condition that judging be understood anew not as the application of preexisting rules but rather as the activity of seeking agreement with others

by imagining oneself in their place to arrive together at a reflective position that did not exist before.

Controversies

Arendt was permanently puzzled by racism and race relations in America, issues she tried to understand in light of her experiences as a Jew in Germany. In an article, “Reflections on Little Rock,” published in 1959, Arendt attempted to apply her analysis of the lethal political backlash against the social emancipation of European Jews to the desegregation of American schools, rejecting the process—integration enforced by the federal government—and arguing that a mistaken focus on acceptance in the social realm deflected attention from the proper struggle for human and political rights. The article provoked a public scandal and the ire of liberal critics. A decade later, Arendt would have similar difficulty commenting on the militant activism of black students on American university campuses, charging them with a destructive turn to violence and dismissing their demands.

But the controversy that defined Arendt for many was the one that erupted around her report on the trial of Adolf Eichmann before an Israeli court, *Eichmann in Jerusalem* (1963). Arendt’s report explored how an undistinguished, individual bureaucrat, the head of the Nazi office that oversaw the deportation of Europe’s Jews on the way to their extermination, who apparently himself had little fundamental commitment to this Final Solution of the Jewish problem, could nonetheless administer a policy of eliminating a people from the earth. Arendt sought to understand how there were so many like him who actively cooperated in the annihilation of the Jews at every level of the process—including Jews themselves, who were not immune to the moral collapse caused by the Nazis across society, in Arendt’s diagnosis. She concluded that Eichmann was simply incapable of thinking, dubbing this phenomenon “the banality of evil”; a constant refrain in her work was the call to think what we are doing. But the focus of the outrage that met the book was her depiction of the cooperation of Jewish community leaders who, confronted with demands made by Eichmann and his office, often facilitated the deportations. Arendt linked their actions to European Jews’ broader avoidance of plural political engagement, including

a failure to distinguish political friends and enemies, instead of viewing all interactions with non-Jews in terms of an eternal anti-Semitism, which she argued had tragically worsened Jews' plight when faced with a wholly unprecedented crime. Critics, however, accused Arendt of blaming the Jewish victims for their fate; a concerted publicity campaign largely made her persona non grata in Israel and in the American Jewish community. (A scurrilous, speculative account of Arendt's relationship with Heidegger, based on what survived of their correspondence, published in 1995, reignited the controversy, providing new fodder for those critics still looking for any reason to discredit her thought.)

Legacy

Despite her personal dislike of the spotlight, Arendt found herself a public intellectual in America; the positions she took continue to make classification of her work difficult. Arendt was deeply critical of the consumerism of postwar society, its displacement of politics by public relations, and its turn away from the love of the world toward self-fulfillment. She insisted on the exclusion of the social question from the political domain and opposed the liberal turn toward effecting social progress through a centralized administration. And she wrote of the necessity for civil disobedience in law-governed societies and was a harsh critic of the U.S. war in Vietnam and its effects on U.S. political institutions. Arendt's analysis of totalitarianism was a continuing point of reference for studies of the Soviet Union, although her specific arguments were often overshadowed by Cold War polemics. Her invocations of ancient Greece and Rome and colonial America have led many to read Arendt's work in the tradition of participatory republicanism—and to accuse her of a romantic nostalgia for antiquity according to which politics would be possible only on a small scale and dependent on heroic actions by an elite few. Jürgen Habermas, today's most prominent advocate of deliberative democracy, credits Arendt with being the source of his communication concept of power. Arendt was discovered anew by a broad circle of students of political theory in the 1990s in the wake of the revolutions that brought an end to state socialism in Eastern Europe and by those drawn to her advocacy of a radically pluralist conception of politics. Arendt's work has been an important inspiration for agonistic conceptions

of democracy that emphasize the perpetuity of interaction and dissensus in a world that, as common, provides the site of politics but no source for their resolution.

Arendt's written work rewards careful reading but remains elusive: her major works exist in multiple editions incorporating substantial revisions, as well as significant variations between German and English versions that she often wrote herself. In addition to the major works from Arendt's lifetime, several new collections of writings and lectures, much of her extensive correspondence, and (in German) her diaries have been published since her death, affording a broader perspective on Arendt's intellectual and public activity. The Library of Congress has digitized its holdings of Arendt's papers and made many available online. Arendt's uncompleted manuscript titled "Introduction *into* Politics," issued in the volume *The Promise of Politics* (2005), now provides a highly instructive overview of many of the themes treated elsewhere in her work.

Raymond Aron (1905–83) was a distinguished French philosopher, political thinker, social scientist, and journalist. He wrote influential columns for *Le Figaro* (1947–77) and *L'Express* (1978–83) and played a major role in shaping moderate and conservative opinion in France in the years after World War II. Today, he is widely acknowledged to be one of the most prominent twentieth-century representatives of the French tradition of political liberalism. He was profoundly shaped by his experience of witnessing the rise of National Socialism in Germany as a student in that country in the early 1930s. As he put it in his 1970 inaugural address at the Collège de France, the experience of a civilized country descending into barbarism permanently cured him of “facile progressivism,” the illusion that “history automatically obeys the dictates of reason.”

It was during this period that Aron discovered the sociological and historical reflection of the German sociologist Max Weber, whose thought he admired and did so much to introduce into French intellectual circles. But the mature Aron expressed grave doubts about the excessive pathos and Nietzschean nihilism that he came to see just beneath the surface of Weber’s austere methodological reflections. Aron increasingly turned to an array of thinkers—the political Aristotle, Alexis de Tocqueville, and Charles-Louis Montesquieu among them, who provided a firmer foundation for his own choice of political moderation over fanaticism in its various forms. In a series of writings culminating in *The Opium of the Intellectuals* ([1957] 2001), Aron criticized the indulgence of progressive intellectuals

toward totalitarian regimes and ideologies and dissected the myths of the left, revolution, and the proletariat, respectively. Despite a well-deserved reputation for thoughtful and balanced political analysis (Aron always insisted that the principal virtue of the social scientist was equity, not neutrality), he won the unrelenting enmity of Jean-Paul Sartre, who never tired of dismissing him as an “anti-communist dog.” For many French intellectuals in the decades after World War II, it was “better to be wrong with Sartre than right with Aron,” to cite a saying that widely circulated at that time.

Aron was a remarkably prolific writer and scholar. The author of at least forty-five books and of dozens of others that appeared posthumously, he wrote about modern political regimes and industrial societies in a manner that affirmed the essential autonomy of politics, theorized about international relations (he was a harsh critic of the realist-idealist dichotomy so central to contemporary international relations theory), and wrote influential interpretations of such classic political and philosophical thinkers as Niccolò Machiavelli, Karl Marx, and Tocqueville. His masterworks such as *Paix et guerre entre les nations* (1962) and *Penser la guerre, Clausewitz* (1976) explored the intersection of political philosophy and international relations. They combined encyclopedic learning and moderate and humane judgment with what Aron’s friend and contemporary Bertrand de Jouvenel called “the sadness of the political thinker.” For Aron, there was no end of history in sight. The best hope was to cultivate moderation and to bring violence under salutary political control. Aron was a tough-minded moderate, a conservative-minded liberal, who at the end of his life worried that liberal societies had forgotten that free men were citizens with duties and not merely individuals with rights. For his admirers, such as the French political theorist Pierre Manent, he was that rarity, an orator and civic educator “who spoke with authority and competence and eloquence about the public thing” (2010.) He remains an important intellectual, political, and scholarly reference point in France and in many countries around the world, including the former communist countries of east-central Europe.

Australasian Political Thought (Australia and New Zealand)

Political ideas in Australia and New Zealand (Aotearoa) reflect the British settler origins of both societies, especially provincial British and Irish ideologies during the period of settlement in the nineteenth century—slightly later in the case of New Zealand. Discourses have taken place within a context of prevailing secular liberalism and a high degree of consensus favoring parliamentary democracy. Both societies grew in a context of industrial life but were initially focused on rural production being integrated into the economy of the British empire at its height. They shared the paradox of great distance from the colonial metropole inhibiting rather than hastening the emergence of independent thought. In both cases, the Indigenous people were badly dealt with during the settlement period and after, and this treatment has had a chastening effect on political thought. In spite of the many political similarities, some differences have emerged, and New Zealand political ideas will be examined, including themes that both countries share, after looking at the Australian experience.

Australian Political Thought

Academic writing on the political tradition in Australia has been sparse, giving a misleading impression that ideas have not been present in politics. Political tourists such as Albert Metin and Andre Siegfried who visited

Australia and New Zealand in the period around 1900 claimed that there were no grand debates, only a politics of interest. The first academic account of Australian political thought by Peter Loveday in 1975, only twenty-six pages, supports this judgment. Ten years later, Bill Brugger and Dean Jaensch (1985) provided an ideological account of popular political ideas in two chapters, and at the same time Graham Maddox published the first edition of *Australian Democracy* in which Australian contributions to democratic thought were first taken seriously. Many chapter-length accounts, including those collected in a 1994 volume edited by Geoff Stokes as well as intellectual biographies, provide a fuller view of the large amount of source material. James Walter (2010) has demonstrated the utility of using discourses as markers for the activities and publics of political intellectuals in an account that benefits from the Gramscian concept of organic intellectuals. Finally, political economists and labor historians have constructed a body of literature on debates within working-class organizations and political parties.

The Early Period

Although most interest surrounds later periods, there were political debates and political ideas in the settlement period. The penal settlement of 1788 expanded under the autocratic administration of Lachlan Macquarie in the 1810s, which sought to extend public works and integrate former convicts with free settlers. One free settler, W. C. Wentworth, spoke of creating a new Britannia and of recognizing the rights of rehabilitated felons, but most of that group spurned the ex-convict majority. This embryonic struggle was overtaken by events in the 1830s when colonial administrators realized the vast potential in the sale of land previously confiscated from the Indigenous people. Revenues could be partly used to finance immigration, which in turn generated more land sales. When the British attempted to reintroduce convicts in the late 1840s, the newly augmented population rose as one to resist and the policy lapsed. The 1830s also saw widespread illegal land occupation by some enterprising and wealthy immigrants who became known as Squatters. The Squatters combined with other large landowners to form the first political elite that dominated the small council set up in 1828 in New South Wales to advise the governor.

Some students of Australian political thought have followed U.S. historian Frederick Jackson Turner by emphasizing the frontier as imprinting culture upon the British and Irish underclass represented by emancipated convicts turned rural workers, while others have followed another U.S. theorist, Louis Hartz, in stressing the 1830s wave of migration that implanted fragments of working-class British society that were sympathetic to Chartism. Both the bush legend stereotype of rural workers shaped by the advancing frontier and the Chartist fragment thesis based on transplanted British provincial paupers are challenged by yet another twist of history, an immense gold rush in the newly established colony of Victoria in the early 1850s. The gold mining that catapulted Victoria to the forefront of economic life coincided with a radical government in Britain that adapted the 1828 Durham Report on responsible government for Canada to the Australasian colonies, and the implementation of the policy coincided with an armed rebellion of miners at Ballarat in 1854 claiming political rights. When the colonial parliaments were constituted in 1856 and 1857, their highly representative lower houses and dangerously powerful upper houses reflected the intervening debates in the colonies, which pitched democratically minded citizens against the landowning elite.

A useable pamphlet literature and corresponding amounts of newspaper and magazine material that appear from this time until the 1880s confirm the dominance of liberalism of the form associated with John Stuart Mill. Victorian writers after the late 1850s consistently supported a high tariff policy, which became entrenched via the influence of David Syme and his newspaper *The Age*, and a contrasting low tariff policy in New South Wales was associated with Henry Parkes and George Reid. The tariff issue reflected different philosophies of economic development, with Syme supporting the industrial path to prosperity and the Parkes group supporting agriculture and Cobdenite free trade. This free-trade philosophy was a variant of the individualist and idealist British liberalism of Richard Cobden and Richard Bright that was later associated with William Gladstone. Parkes had been exposed to Chartism before emigrating in the 1830s, and in Sydney he joined the Stenhouse Circle, a loose federation of writers inspired by J. D. Lang. Lang championed high immigration in the 1840s but is better remembered for his sectarian Presbyterian brand of republicanism modeled on the United States.

Political life before the 1880s was haphazard with no real parties and little theoretical questioning of liberalism. The power of the landowning elites had been broken by acts for closer settlement beginning in 1860, and the broad franchise forced aspiring politicians to canvass widely. The most progressive of the liberal intellectuals was Charles Pearson (connected to the circle of Mill before emigrating) who championed education and social improvement generally, but always in a context of self-help. Large immigration during the 1870s and early 1880s maintained a situation where most of the citizenry was British or Irish born, the Irish element being about a quarter. Trade unions grew in this period from the craft unions in the building and construction industries that won the eight-hour day in 1856 to embrace large numbers of sheep shearers and miners, but these developments are not associated with any ideological movements apart from the union ideal itself. The newspaper and periodical press provided a public sphere for intellectuals, and a key development in this area was the founding of a radical weekly in 1880 called *The Bulletin*.

The Golden Age

The pages of *The Bulletin* show how political thought in Australia passed through a liminal period roughly between 1885 and 1895. The semisocialism of Henry George's 1879 text *Progress and Poverty* caught on in Australasia because the phenomenon of land speculation was as familiar in Australia as in California, and many land nationalization societies emerged. The logical next step to full socialism was encouraged by the rapid growth of socialism in Britain. The simultaneous establishment in Sydney in 1887 of an Australian Socialist League and an Economic Association, venues of socialism and liberalism respectively, is emblematic. Larger strikes in the 1880s facilitated the spread of socialism, and union newspapers provided a medium for new ideas. Marxism arrived via the 1887 edition of *Capital*, present in many public libraries, the first nine chapters of which circulated in booklet form. Such ideas were mainly filtered, however, via the U.S. writers Laurence Gronlund and especially Edward Bellamy, whose utopian novel *Looking Backward* was massively popular in Australia and New Zealand. The Brisbane based organizer William Lane summed up the popularity of these ideas with his slogan "socialism is being mates." Utopian, dystopian, and related literature

flowered briefly, including Lane's 1892 novel *The Workingman's Paradise* and the 1889 utopian science fiction by Joseph Fraser *Melbourne and Mars* depicting a society where technological progress had caused the abolition of all property and the advent of world federation.

These developments took on greater significance with the formation and success of the union-based Australian Labor Party (ALP). After the positive experience of industrial unionism during the 1880s and the workers' victory in the London Dockworkers' Strike of 1889, there were large but failed Australian strikes in 1890, 1891, 1892, and 1894. After the bitter experience of the 1890 strike, the project of a union political party, debated throughout the 1880s, was completed in 1891 with the formal establishment of the ALP. The 1891 shearers' strike also produced iconic verses on social justice by Australia's most revered poet, Henry Lawson. In these years, *The Bulletin* supported a variety of political ideas including socialism, republicanism, high tariffs, federation, and opposition to immigration—especially non-British immigration—and these ideas were linked to the bush legend stereotype.

Liberalism was itself undergoing changes, although these relied less on local factors such as strikes and more on the new ideology being developed in Britain, especially at Oxford. The small Australian universities had started to teach courses in history and philosophy, and at Sydney, two key liberals were Walter Scott, a protégé of Benjamin Jowett, and Francis Anderson, a protégé of Edward Caird. In Melbourne, the rising intellectual in politics was Alfred Deakin who also followed the new liberalism, although with generous admixtures of Mill via his mentor Charles Pearson. Another rising liberal was B. R. Wise, who returned to Sydney after having been a keen follower in Oxford of Arnold Toynbee and of the free-trade ideas of the Cobdenites. Their writings are idealist and often refer to the common good and notions of duty or Hegelian concepts of the state, but they also supported the policy of arbitration of industrial disputes that arose in 1886 and grew to become the favored response to class struggle. They gravitated to causes such as imperial federation, which encouraged the study of international relations. The old laissez-faire liberalism kept some adherents, most notably Bruce Smith, who published a number of books critical of state interference.

The nationalism of *The Bulletin* was brittle and tentative, but in 1901, Australia became an independent dominion of the British empire. Federation of the six colonies, renamed states, took place sporadically from the early 1880s through the boost given by Parkes in 1889 and the conventions in 1891, and in 1897 to 1898, to the promulgation of the Constitution in London in 1900. Most of the voluminous political writing surrounding the process, especially during the referendum campaigns of 1898 and 1899, is legalistic. Socialists such as Bernard O'Dowd argued unsuccessfully for a "No" vote because the federal Constitution was seen as undemocratic. The pragmatism of the architects of federation prevented inclusion of citizenship clauses, and progressive liberals such as Deakin and H. B. Higgins were only narrowly able to insert arbitration and age pension clauses. The political atmosphere after the early 1890s had shifted and by January 1, 1901, when the Commonwealth was born-political debate had cooled considerably.

Federation to World War I

Foremost among the reasons for federation was military preparedness. Writings by T. R. Roydhouse, Edward Dyson, and others purported to demonstrate an Asian menace to the north. The Boer War of 1898 to 1902 was strongly endorsed by some, and just as strongly repudiated by others; liberals Higgins and G. A. Wood saw it as a British exercise in imperialism. The rising suburban professional middle class was more stridently pro-British than the British born of earlier times and denigrated all things Australian, a tendency observable for at least the next fifty years. Early Commonwealth parliaments were in Melbourne, and liberalism flourished there in venues such as the Boobooks dinner club founded by Frederic Eggleston in 1902. One of the first products of the Commonwealth was the White Australia policy of immigration restriction based on concepts of race, restrictions that were endorsed by socialists and liberals alike. In the 1920s, Eggleston became unpopular among London liberals for refusing to disavow the policy.

While social liberalism had vanquished laissez-faire ideas and entrenched arbitration, socialism was becoming more divided. The ongoing electoral success of the ALP exposed theorists such as W. A. Holman to the realities

of government, and together with the hostility of the Irish religious to socialism after the papal encyclical *Rerum Novarum*, this produced a shift away from Bellamy and toward Fabianism. Piecemeal gas-and-water socialism was pursued by the ALP in government resulting in a number of state-owned enterprises. Earlier, the role of the state in building railways and in other functions had impressed observers of the Australian and New Zealand colonies and had given these a reputation as social laboratories. Just before the ALP triumph in the 1910 Commonwealth elections, several ALP intellectuals—including W. M. (Billy) Hughes, H. I. Jenson, and W. G. Spence—published writings that supported the moderate union ideal of collective defense from excessive capitalism and state ownership of natural monopolies. Growing interest in Marxism was manifest in the formation of an Australian offshoot of the Chicago-based Industrial Workers of the World (IWW). By the time the ALP swept to office in 1910, the IWW was importing shipments of Marxist literature, including the edition of *Capital* published in Chicago by the Charles Kerr printing collective.

The experience of World War I cast a long shadow over political life and thought. With sixty thousand Australians dead and three times that number maimed, there were few not touched in some way by human tragedy, and it was the same for New Zealand. Australia fought for Britain but paid its own way, stimulating industry but also creating massive public debt (hence the remark by socialist Frank Anstey that Australia was “renting trenches”). Large-scale war created the combined

Australian and New Zealand force known as ANZAC, and Gallipoli remains central to nationalism in both countries. British atrocities in Ireland in 1916 had severe repercussions in the ALP so that ALP Prime Minister Hughes needed to hold a referendum to legitimate the introduction of conscription for overseas service. He tried twice, in 1916 and 1917, narrowly losing each. These conscription debates tore Australian society apart and split the ALP. They produced aggressive writing in which imperial nationalism fought Irish outrage, Marxism, pacifism, and feminism. The IWW was blamed for undermining the war effort, especially after a large strike in 1917, leading to political surveillance and increased press censorship.

Between the Wars

Middle-class suburbs grew apace, and with suburbia came automobiles and electric appliances, including radio. There was an observable slump in political writings in the middle of the 1920s. In 1919, a liberal organization, the Worker's Educational Association, sponsored publication of *Democracy and Freedom* in which Elton Mayo supported social organicism within a liberal framework. Later in the decade, Eggleston wrote bitterly against state enterprises, and his manuscript formed a basis for W. K. Hancock's *Australia* of 1930, which is the archetypal statement of Australian liberalism, combining concern for the common good with defense of property rights and disdain for public ownership and arbitration.

The Russian Revolution was eagerly studied by socialists, but as R. S. Ross, the leading Marxist, pointed out, the vanguard party was uniquely fitted to Czarist realities and had dubious relevance. In 1920, the Australian Communist Party was formed, and though it recycled Comintern material, it did encourage original writings by K. S. Pritchard, L. P. Fox, and others. Following the repression of the IWW and the failure of attempts to set up "One Big Union," some of these Marxists flirted with the Communist Party. When the political left revived in the late 1930s, there were few of these industrial Marxists left, and the Communist Party was the only alternative to the ALP. The other Marxist of note was V. Gordon Childe, whose 1923 book *How Labour Governs* remains a classic account of reformism, betrayal, and the evolution of a spoils system in party politics. Childe left Australia to become one of the leading figures in twentieth-century archaeology.

The economic crisis of 1929 to 1932 produced abundant literature, but mostly it took the form of unorthodox economic remedies and reactionary polemic. Orthodox economists became popular as savior figures pressuring the new ALP government for a deflationary monetary policy. Only in the 1940s did the U.S. New Deal inspire welfarism, fiscal policy, and Keynesianism. The middle class sprouted secret armies such as the fascist New Guard, which failed to prosper. Liberalism persisted behind formal associations such as the Australian Institute of Political Science and shadowy roundtable groups, and the annual anthologies of the AIPS are a

valuable source for social liberal thought. One distinctive text of nationalism emerged, however: P. R. Stephensen's *The Foundations of Culture in Australia*.

War, Reconstruction, and Menzies

Forced to defend itself from Japanese attack, Australia rapidly industrialized and became self-reliant, although paradoxically also embraced an alliance with the United States. Victory brought with it determination to maintain full employment via state intervention in the economy championed by Keynesians such as H. C. Coombs. A more assured sense of Australian identity is found in the writings of Brian Fitzpatrick on economic history. The ALP governments of John Curtin and Ben Chifley built industry to fight the war and employ returning military personnel. Curtin's popularity was disastrous for the other side of politics, and in 1944, Robert Menzies attempted to rebuild the anti-Labor vote by forming a new Liberal Party. His 1944 radio broadcast on *The Forgotten People* has become the key text for that side of politics and is a restatement of themes from Hancock and Eggleston.

When Menzies won the 1949 election, he retained most of the nation-building policies of Chifley but embarked on a crusade against the Communist Party, a crusade that failed but did stimulate writing on civil liberties. His prime ministership lasted until 1966, and his main contribution was the expansion of suburbs and universities. Donald Horne's *The Lucky Country* of 1966 marks disenchantment and a libertarian turn, while conscription linked to the Vietnam War united dissenting voices and produced pungent countercultural critiques such as *Oz* magazine. The consensus of moderate socialism and social liberalism was now being challenged by the rise of new social movements. Australasian universities were now producing important intellectuals, and some made their mark internationally, often by relocating to larger centers. Some examples include Germaine Greer and Carole Pateman in feminism, J. G. A. Pocock in history of political thought, and Hedley Bull in international relations.

Modern Times

Apart from the election of the ALP under Gough Whitlam in 1972 and the controversial dismissal of Whitlam by the governor-general in 1975, economic change rather than political events has dominated the intellectual landscape. Following the demise of the Bretton Woods system of worldwide capital controls in 1971, the simultaneous unemployment and inflation of the mid-1970s and 1980s caused ideas to shift away from the postwar consensus and Keynesianism toward laissez-faire liberalism. Both major parties adopted market economics, and in 1992, *The End of Certainty* by Paul Kelly lauded this Gramscian hegemony over democratic socialism and social liberalism. Indigenous and environmental politics moved into view with contributions by Tim Rowse and Tim Flannery, among others, and the events of 1975, catalyzed a growing literature on adoption of a republic. Financial events since 2008 caused some writers including former Prime Minister Kevin Rudd to return to an examination of the merits of the postwar ideological consensus, and laissez-faire liberalism has passed out of favor.

New Zealand

British settlement formally commenced in 1840, and immigration rapidly grew after 1870 with intakes from provincial Britain remaining high until the 1930s. With early settlement having been inspired by ideas of Edward Gibbon Wakefield, ideas that stressed the need for high land prices and low labor costs as a spur to development, thrift, and self-help, it is not surprising that settlers were more middle class than in Australia, especially in the Wakefield settlements at places such as Petone, Nelson, and Taranaki. This pattern is not applicable to all areas, and Otago, for example, was not a Wakefield experiment but had Presbyterian roots. Geographical factors (rich soils and reliable rainfall) enabled small farms to prosper as they had been unable to in Australia, and the population as a result was less urbanized and the economy more agricultural. Size and distance conspired with constant immigration to create high dependence upon British political ideas and to perpetuate British identity. Like Canada and the United States but unlike Australia, the act of settlement was accompanied by a treaty with the Indigenous owners, and even though the Treaty of Waitangi of 1840 was honored more in the breach than in the observance, it has permitted and shaped dialogue.

Parliamentary politics became ideologically contested from the 1870s onward following the violence of the previous decade or so associated with land taking and Maori resistance in the North Island. Liberalism flourished as in Australia except that land politics had not yet been damped down by acts against large estates, and the smaller farmers were still discovering their electoral power. The leading liberals of the 1880s and 1890s were Robert Stout and William Pember Reeves, both of whom combined roles as intellectuals and parliamentarians. Stout was still a classical liberal in the 1870s, deriving his position mainly from John Stuart Mill and especially Herbert Spencer. The unemployment of the 1880s and sharpening class antagonisms offended his immigrant sensibilities, which saw New Zealand as a venue for social harmonism. He developed a philosophy similar to T. H. Green and particularly Arnold Toynbee from whom he borrowed the concept of arbitration of industrial disputes. Stout was the intellectual force behind the adoption of arbitration in 1894, which together with female suffrage in 1893 forms one of the principal claims of New Zealand as a social laboratory. Reeves was such a progressive liberal that he could be regarded as a mild socialist, yet he famously distanced himself from socialism, especially the Edward Bellamy variety. In the 1890s, he championed many trade union causes, although this advocacy proved too much for the mainly rural electorate, and his political career ended abruptly in 1895 when he went to London as agent-general. In 1902 (2011), he published his best known work *State Experiments in Australia and New Zealand*. His social liberalism resembles that of Australians such as Deakin and Henry Wrixon especially in its frank advocacy of state provision of services or state socialism.

The Liberal Party to which Reeves belonged took upon itself the representation of workers in the early 1890s, and thus, there was not the same pressure that created the ALP. New Zealand waited until 1916 for the advent of the Labour Party, and this party was more like its British namesake than the ALP. In the meantime, Marxist intellectuals sympathetic to the IWW were active including H. E. Holland and James Roberts, both of whom later moderated their theories and joined the Labour Party. Holland produced many pamphlets adapting Marxism to New Zealand conditions and followed Ross as editor of *The Maoriland Worker*. The ideas of Henry

George were widely discussed and adapted, creating pressure to break up large estates in favor of small holdings.

The Labour Party came to power for the first time in 1935 and established the welfare state by developing New Deal policies that had been discussed in Britain, putting them into practice before other countries did. The embrace of welfarist and Keynesian ideas was a pragmatic response to the social crisis but was theorized by J. A. Lee and other party intellectuals. There was also much writing on the Social Credit concept, which belongs to the same category as Henry George—a radical reform that does not affect small owners. In this respect, New Zealand is more like rural Canada than Australia.

The end of the postwar consensus in New Zealand parallels the Australian experience with a Labour Party government taking power in 1984 and immediately introducing measures to deregulate the economy. This version of Thatcherite market economics became known by the name of the treasurer Roger Douglas—Rogernomics. Policies of Rogernomics sought to reform a sleepy economy via financial deregulation, a floating currency, wage restraint, tax cuts, free trade, and monetarism. As in Australia, these ideas were hegemonic and had no popular mandate, and in New Zealand, they went further than they did in Australia. The fragmented intellectual left was placated by adoption of antinuclear policies, and this caused a 1985 ban on visits by U.S. warships, which challenged the alliance. During the 1970s, Maori leaders insisted on observance of the treaty, and a Waitangi Tribunal set up in 1975 helped to focus debates on Indigenous social justice concerns. An original contribution to political thought during this period was Richard Mulgan's 1984 text *Democracy and Power in New Zealand*, which explores the strengths of pragmatism in a small democracy and includes discussion of Maori democracy. In Australia, Aboriginal political ideas have frequently emphasized need for a treaty and related sovereignty issues whereas Maori ideas have been able to move beyond such fields. Maori thinking has flourished in several areas including identity, feminism, and resource management, and this has affinities with Indigenous theorizing in North America.

Authority

Authority is a core concept in political theory, one that picks out a significant feature of sociopolitical practices, relations, and institutions. Of course, the concept is not restricted to this area of inquiry. In fact, it troubles theorists in many areas, from jurisprudence to sociology to social epistemology. Three general problems face such theorists in their investigation of authority. The first problem is conceptual: what does authority mean? The second problem is classificatory: what are the different forms of authority? And the third problem is evaluative: how can authority be justified or legitimated?

For the most part, political theorists have focused on the issue of political authority. Indeed, they have generally focused—even more narrowly—on the political authority of the state. Thus, they have attempted to explain the nature of the political authority of the state, the relationship between such authority and other kinds of authority (such as the authority of other polities), and the justifiability or legitimacy of such authority. Some political theorists even take the last of these issues—the issue of legitimacy (as opposed to, say, that of distributive justice)—to be the fundamental problem of their discipline. They argue, for example, that it makes little sense to ask what role states should play in the distribution of the benefits and burdens of social life if they are illegitimate in the first place. Only legitimate states are in a normative position to play a distributive role, just or otherwise. Of course, others argue that states can only be legitimated by being just.

Whatever is to be said about this particular dispute concerning theoretical fundamentals, we can attempt to map out some (purported) solutions to the three problems—conceptual, classificatory, and evaluative—introduced above, at least in so far as these are relevant to political theory.

The Conceptual Problem

Authority has been explained (among other ways) as a species of social power and as a species of normative power. The former line of explanation has been advanced by sociologists of power in the tradition of the German sociologist Max Weber. The latter has been advanced by philosophers of practical reason in the tradition of the Israeli philosopher Joseph Raz. On the sociological account, then, authority is understood as a species of domination—as a controlling capacity in human relations—which is understood, in turn, as a species of social power—as an effective capacity in human relations. Thus, authority involves more than the capacity of one party to have an effect or influence on another party, or even more than the capacity of one party to have a controlling effect or influence on another party. It appears to involve the capacity of one party to “rightfully” exercise a controlling effect or influence on another party. Authority, in other words, appears to amount to rightful domination. Thus, parents, for example, seem to have more than a capacity to control their children’s behavior. They seem to have a capacity to rightfully control their children’s behavior, and it is in this that their (practical) authority is often held to consist. Adult strangers, by contrast, may possess a controlling capacity over the same children, but they lack an authoritative right (at least of the relevant kind) to control these children.

Such an account of authority may seem plausible initially (if we can make sense of rightfulness). However, there are familiar cases of rightful social control that we tend to regard as nonauthoritative. When, for instance, an adult stranger forcibly prevents a child from recklessly crossing a busy street, we may think that he or she is rightfully exercising a controlling capacity over the child in question, even though he or she is no authority with respect to the child. Authority, therefore, seems to amount to something other or more than rightful domination or legitimate social control.

On the philosophical account, authority is understood, again, as a species of normative power or the power of one party to require action and (more contentiously) the acceptance of belief from another party. In order to make sense of authority so understood, some have argued that it is necessary to understand the way in which it figures in the practical reasoning of its subjects. The directives of an authority—authoritative utterances such as commands or (some would say) expert advice—may be seen to constitute appeals to the reasoning of its subjects about how to act or which beliefs to accept. The problem here is, then, how to explain the exact manner in which authoritative utterances figure in our reasoning. One suggestion, made by the British philosopher H. L. A. Hart, is that such utterances provide us with content-independent reasons for action or the acceptance of belief. To put this point very simply, what matters from the perspective of the subject of authority is who produces an authoritative utterance, not what the utterance entails (its content). If my boss commands me to ϕ , what matters is that it is my boss who is commanding me to ϕ , not that he or she is commanding me *to* ϕ ; in principle, he or she could have commanded me to χ or to not- ϕ .

The provision of content-independent reasons is not sufficient to distinguish authoritative utterances, however, since other utterances such as promises and threats are also understood to provide us with such reasons. A further suggestion, then, is that authoritative utterances provide us, in addition to content-independent reasons, with peremptory reasons for action or the acceptance of belief. In other words, these utterances are intended to cut off our reasoning about how to act or which beliefs to accept so that authority can be understood to require the surrender of private judgment and perhaps to conflict with certain principles of rationality or autonomy.

The claim that authoritative utterances provide us with peremptory reasons may be rejected as implausible. After all, authorities are typically indifferent to our deliberations; all they require is actual conformity with their directives, or that we act or accept beliefs as directed. An alternative suggestion is that authoritative utterances provide us, in addition to content-independent reasons, with exclusionary reasons (rather than peremptory reasons) for action or the acceptance of belief. That is to say, authoritative utterances provide us with nonordinary reasons for action or the acceptance

of belief, reasons that exclude and take the place of some of our ordinary reasons against such action or acceptance of belief. If my boss commands me to ϕ , he or she is providing me with a reason that excludes some of my reasons to not- ϕ (such as the fact that ϕ bores me or I would rather χ). If this account of authority is correct, then, we can say that someone (such as a boss) has authority over us if and only if the fact that he or she requires us to ϕ gives us a content-independent reason to ϕ and excludes some of our reasons to not- ϕ .

The Classificatory Problem

A standard classification of the forms of authority rests on the distinction between practical authority, or authority in matters of conduct, and theoretical authority, or authority in matters of belief. If the philosophical account of authority outlined above is generally applicable—that is, applicable to both practical and theoretical authority—then the following ought to hold: A has practical authority over B if and only if the fact that A requires B to do X gives B a content-independent reason to do X and excludes some of B's reasons not to do X; A has theoretical authority over B if and only if the fact that A requires B to accept belief Y gives B a content-independent reason to accept belief Y and excludes some of B's reasons not to accept belief Y. However, no major philosopher believes that the account is generally applicable: most philosophers hold that it is applicable to practical authority only. Why, then, do they deny the applicability of this account to theoretical authority? Basically, because they deny that theoretical authorities have normative power (or are authorities in the sense that they investigate): they deny that such authorities require or even could require the acceptance of belief. Requiring the acceptance of belief is psychologically impossible, and even if it were possible, theoretical authorities simply do not require it. However, both claims—the psychological claim about belief formation and the philosophical claim about normative power—are debatable. The philosophical claim, for example, may rest on the conceptual confusion results from the identification of theoretical authority with expertise. In attempting to clear up this confusion, one might attempt to show that some theoretical authorities (parents, for example) are not experts and that even that some

experts (scientific researchers who make no authoritative claims, for example) are not theoretical authorities.

The interest of political theorists in authority is generally an interest in a particular kind of practical authority—or authority to which the philosophical model is (less contentiously) applicable—namely, the political authority of the state. Of course, one might deny that the authority of the state is only political or only practical. Thus, one might argue that the practical authority of the state is legal as well as political and that the state (at least in certain instances) exercises theoretical as well as practical authority. To be precise, one ought to distinguish between political and legal authority, though it seems that many theorists have both in mind when they refer to the political authority of the state. As for the theoretical authority of the state (or some states), this is generally held by political theorists to be beyond the scope of their discussion in so far as it is beyond the scope of legitimacy. Since such authority is self-evidently illegitimate, one might suppose (reasonably or otherwise) it does not require further theoretical discussion.

What, then, distinguishes the political authority of the state from other forms of practical social power, domination, or authority? There is no consensus on this issue. But one suggestion (by the Scottish philosopher Leslie Green) is that the authority of the state is distinguished by its supremacy, pervasiveness, and breadth of scope. That is to say, the state is the highest authority within a given territory or over a given population, its authority regulates the vital interests of everyone within that territory or population, and (most problematically) its authority operates on a large territorial or demographic scale, relative to other social and political configurations.

The Evaluative Problem

What all of the above means is that the authority of the state is evident where A (a state official) requiring B (a subject of the state) to do X gives B a content-independent reason to do X and excludes some of B's reasons not to do X, in circumstances where this authority is supreme, pervasive, and broad in scope. The evaluative question that arises in this context is whether

such authority is justifiable, or (what may or may not amount to the same question) whether the authority of the state is legitimate with respect to its subjects (typically understood as citizens). If the authority of the state is legitimate with respect to its subjects, then these subjects are usually held to have political obligations toward the state. That is to say, in accordance with what has been called the correlativity thesis, legitimacy entails obligations and vice versa. But how might legitimacy be established? Has it been established? Could it ever be established?

The principal means by which the political authority of the state might be legitimated are various but broadly classifiable as consequentialist and nonconsequentialist. By consequentialist means, one might establish legitimacy with respect to a particular good (such as utility) the state serves to promote. By nonconsequentialist means, one might establish legitimacy with respect to certain standards of right (such as consent, fairness, or justice) the state respects. Indeed, in pluralistic fashion, one might argue that different aspects of the state's authority are legitimated in terms of different moral principles. However, reflecting on the various arguments that have been offered for the legitimacy of the political authority of the state, one might conclude that none of these arguments succeeds, that no known argument establishes what it is supposed to establish, and that the political authority of the state is therefore illegitimate. This is the position of the a posteriori philosophical anarchist. The a priori philosophical anarchist makes a stronger case against the political authority of the state, arguing that legitimacy could never be established since state authority necessarily conflicts with, for example, a moral duty of autonomy. The political anarchist, by contrast, is usually characterized as holding that the state ought to be challenged practically in virtue of the illegitimacy of its political authority (whether this is established on a posteriori or a priori grounds).

Autonomy

The term *autonomy* stems from two Greek words: *autos*, meaning self, and *nomos*, meaning rule or law. The term originally applied to Greek city-states that were self-ruling but has come to be used primarily to refer to individual persons who are self-ruling and hence autonomous. This focus on the autonomy of persons has led to the concept of autonomy playing a significant role in modern political thought. One of the justifications of democratic institutions is that they respect the autonomy of those who participate in them, enabling them to exercise their autonomy in choosing their political leadership or the policies and laws that they will be subject to. Similarly, many state services ranging from the provision of welfare and healthcare to the provision of education and the regulation of business are justified on the grounds that they would either promote or protect personal autonomy, while those who object to such state involvement in the lives of its citizens often do so on the basis that it compromises the autonomy of those subject to it. A concern for personal autonomy has also been used to justify freedom of speech, freedom of religion, freedom of assembly, and the right to engage in acts that might be either immoral or harmful to the person performing them, such as the recreational use of illegal drugs.

While it is agreed that an autonomous person is a self-ruling person, there are two ways of understanding what this self-rule requires. The eighteenth-century German philosopher Immanuel Kant believed that a person was autonomous with respect to his or her actions if he or she performed them in accordance with the moral law that should guide the actions of all

rational agents. As such, Kant believed that a person was autonomous only when he or she acted in the belief that the action that he or she performed could be performed by all rational agents in his or her situation without leading to any logical contradictions. Thus, for Kant, a person could not lie autonomously, for were all rational agents to lie the point of lying would be undermined since no one would trust the word of another.

This impersonal Kantian view of autonomy has been largely supplanted in modern political thought with an understanding of autonomy as personal autonomy. On this view, a person is autonomous with respect to his or her desires or by his or her actions if he or she is the product of his or her own desires and values, rather than being used as the conduit for the desires and values of others. This account of autonomy needs to provide a way to determine when a person's desires and values are his or her own to ground the claim that he or she is autonomous with respect to them. One prominent way of grounding this claim has been provided by Harry Frankfurt with his hierarchical account of personal autonomy. On this view, a person is autonomous with respect to a desire that he or she has for some external object if he or she both wants to have that desire and wants it to be effective in leading him or her to act if, that is, he or she has a second-order volition endorsing the desire in question.

This hierarchical account of personal autonomy faces three objections. The first is the problem of authority: why should it be assumed that a person's higher-order desires are more reflective of what he or she really wants? A woman might have been socialized into wanting to be a good wife and mother and so volitionally repudiates her desires to remain single and pursue a career. There is no reason to assume that her volitional repudiation is more indicative of what she really wants than her first-order desires. The second is the problem of manipulation. On Frankfurt's account of personal autonomy, a person would be autonomous with respect to a desire that was inculcated into him or her by another provided that the volitional endorsement of this desire was inculcated also—and yet such manipulation is inimical to autonomy. Finally, there is the regress-cum-incompleteness objection: why should a person be automatically held to be autonomous with respect to his or her volitional endorsements? If the answer is that he or she needs to endorse them to be autonomous with respect to them, a

regress ensues, for the same question will arise at this higher level of endorsement. If, however, a person is autonomous with respect to his or her volitions for some other reason, then the original hierarchical account of autonomy is incomplete. These problems with the hierarchical account of autonomy have led to it being refined for use in political philosophy, for example, by requiring that a person be autonomous with respect to a desire only if he or she would not have repudiated it during its development.

Babeuf, Gracchus

Babeuf, Gracchus

Babeuf, Gracchus

François-Noël Babeuf, called Gracchus (1760–97), was a journalist and political activist during the French Revolution. Radicalized by its events, he championed a variety of causes along the way: agrarian land reform, the economic interests of the urban poor, a system of distributive communism, and finally a plot for an insurrection calculated to make his egalitarian ideal a reality. For the last among these, he would become a legendary hero for the nineteenth-century French revolutionary tradition.

Some biographers portray Babeuf as a precursor of Karl Marx and see his ideas about communist theory and practice largely formed by the outset of the Revolution. But Babeuf hailed from a rural milieu, and his first writings and initiatives for reform were closely tied to the practical needs of the peasantry for tax relief and land reform. He was born into a large family of modest means in small-town Picardy, and he followed his father into the old regime system of tax farming, working as an accountant for landowners seeking more efficient means to collect ancient feudal dues. He came to find the system repugnant in its exploitation of small-scale farmers with few resources. With the coming of the Revolution in 1789, he became their advocate in a call for equitable tax reform.

During the early years of the Revolution, 1789 to 1792, Babeuf mixed energetically in local politics, both as journalist and as representative in the general council of the department of the Somme. Implicated in a fraudulent land sale scheme, he decamped to Paris in late 1792, where he wrote and

spoke in behalf of the consumerist complaints of the *sans culottes* (shopkeepers, artisans, and laborers) about the high cost of living. About this time, he adopted the pen name Gracchus, in emulation of Gaius Gracchus, tribune of the plebeians in the ancient Roman Republic.

As journalist, orator, and minor municipal official, Babeuf moved within the shifting political alliances of the radical republican clubs of Paris and acquired a reputation as an intrepid spokesman for popular democracy. With the fall from power of Maximilien Robespierre and the ensuing Thermadorian reaction in late 1794, he grew suspicious of the authoritarian drift of the Convention and of the cynical opportunism of its successor in late 1795, the Directory. For them, Babeuf became a bothersome agitator, and he was imprisoned periodically for the excesses of his journalistic polemics. In prison, he mixed with like-minded political dissidents and was emboldened to formulate a scheme for distributive communism. Money would be abolished. Producers, artisans, and farmers alike would bring their wares to central storehouses, where administrators would parcel them out to all citizens in equal measure.

Sensing that the Directory was betraying the republican ideal, Babeuf in 1796 threw in his lot with the Conspiracy of Equals, a secret society dedicated to inciting a popular insurrection to overthrow and displace it. Participants conceived of themselves as a revolutionary vanguard that would oversee the construction of a new regime based on egalitarian principles. Quixotically conceived and hastily organized, their plot was discovered, and Babeuf and his coconspirators were tried for treason before the high court at Vendôme in spring 1797. Babeuf defended his cause with candor and courage. Convicted and sentenced to death, he was guillotined on May 27, 1797.

Despite the variety of causes that he sought to advance over the course of the Revolution, Babeuf's legacy has come to be identified with his martyrdom for the communist-inspired insurrectionary plot of his last days. Thanks in part to a tract later written by his coconspirator Filippo Buonarroti eulogizing the conspiracy and Babeuf's visionary role within it, Babeuf would inspire insurgents of the nineteenth-century French

revolutionary tradition to emulate his militancy, notably the renowned insurrectionist Louis-Auguste Blanqui.

Babeuf's ideas were a mix of practical politics and his reading of the democratic philosophers of the Enlightenment, notably the ideas of Jean-Jacques Rousseau, Denis Diderot, and Gabriel Bonnot de Mably. His sustaining interest throughout the Revolution was to create conditions that would ensure the economic and social well-being of all citizens. His conception of the good society was founded on moral rather than on economic principles and favored direct democracy (including the enfranchisement of women). His attention to social responsibility and economic planning was closer to the utopian socialists than it was to Marx. Arguably, his ideals anticipated those of the twentieth-century welfare state of the Western democracies more so than the state-sponsored collectivism of the Soviet Union.

Bagehot, Walter

Bagehot, Walter

Bagehot, Walter

Walter Bagehot (1826–77) was an essayist, writer, and editor whose legacy includes a notable explication of the evolution of the English constitutional system, a concise analysis of the rise of England’s financial position in the mid-Victorian period, and a clear connection between the English and Continental developments in modern, empirical ideas of how to research and write in the social sciences. Bagehot was, as historian Asa Briggs wrote, “An observer . . . clever, at times, cynical,” but someone who led his readers “into the heart of mid-Victorian society” (Briggs 1954, 115). An essayist, writer, and editor, Bagehot helped to explain his age to his own society and enables the current reader to understand it.

Born in Langport, Somerset, Bagehot grew up in comfortable surroundings, the son of a banker with an intellectual bent. This leaning was reflected in Bagehot’s own studies as a student at Bristol College where he became interested in anthropology. Four years at University College London introduced him to free trade ideas and Chartist arguments. Although originally trained as a lawyer, Bagehot followed his father into banking. For a number of years, he managed the London branch of Stuckey and Co., working on the very street that would become the source of one of his most important books, *Lombard Street: A Description of the Money Market* (1873).

In 1857, Bagehot married the daughter of Sir James Wilson, one of the first editors of *The Economist*, today one of the most influential news magazines

in the world. Wilson, a secretary for the treasury and later secretary for finance for India, introduced Bagehot to the political center of the British Empire. This introduction began the younger man's education and became the source for much of his writings. Upon Wilson's death in 1861, Bagehot became editor of *The Economist*, writing several articles and expanding its coverage to include more politics and coverage of the United States. Bagehot would remain in this influential role until his own death in 1877.

Although known primarily as a writer, Bagehot had parliamentary aspirations. He ran unsuccessfully as a Liberal four times for constituencies as diverse as Manchester and University College, London. Unfortunately for Bagehot, he was neither a Liberal nor a Tory, explaining that he was "between sizes in politics." As a liberal, he accepted "the march of improvement" of the nineteenth century, but remained essentially conservative enough to "believe that reforms should be carried" far enough to maintain stability but not to "generate an accelerating demand for further change" (Briggs 1954, 113). Hence, he was not orthodox enough for either party, despite his desire to serve in Parliament. His failure to become a member of Parliament remained a disappointment.

He is noted for three highly influential books, along with numerous articles and essays in *The Economist*. His first book, *The English Constitution* (originally published 1867) was a clear analysis of the development of the English Constitution, explaining the purpose for keeping such symbols as the monarchy, which had come under attack as Queen Victoria retreated into isolation following the death of Prince Albert. Bagehot believed that the importance of the monarchy was not in its actual power, but rather in its "symbolic and emotional significance" (Bagehot quoted in Thomson [1950] 1991, 171). *The English Constitution* has become an essential on the reading list of any historian specializing in Victorian England. Bagehot's second book, *Physics and Politics: Thoughts on the Application of Natural Selection and Inheritance in Political Societies* ([1872] 1948) connected Charles Darwin's theories on the survival of the fittest and on natural selection to the political realm. One of Bagehot's major contributions was the application of scientific methodology, as adapted from the physical sciences, to political evolution. (Thomson [1950] 1991, 105) In *Physics and Politics*, Bagehot wrote of the forces that provide survival value in a

society, arguing that “spirit of conformity and social discipline, the ‘legal fibre’ which holds society together” does create stability, but this “cake of custom” as Bagehot referred to it gets broken. This evolution actually leads to discussion and change (quoted in Thomson [1950] 1991, 105).

The last book Bagehot completed was his work on the rise of English financial preeminence in the nineteenth century. In *Lombard Street* (1873) Bagehot called upon his experience both as a banker and an underwriter for Lloyds of London. He commented upon London’s assumption of the title of “sole great selling house of exchange transactions in Europe” following the collapse of the Second French Republic, referring to it as an “odd kind of authority” (Bagehot quoted in Thomson [1950] 1991, 141).

Bakunin, Michael

Along with Pierre-Joseph Proudhon and Peter A. Kropotkin, Michael Bakunin (1814–76) is generally ranked among the major theorists of anarchism in the nineteenth century. Best known for his political disputes with Karl Marx in the First International, Bakunin's brand of non-Marxist or libertarian socialism has influenced political thinkers from Emma Goldman to Noam Chomsky.

Life

Born on May 18, 1814, Bakunin was raised in central Russia, attended military school as an adolescent in St. Petersburg, and then, after a brief military career, began studying philosophy in Moscow in 1836. His philosophical influences were primarily from the tradition of German Idealism. Originally he was drawn to the subjective idealism of Johann Gottlieb Fichte; later, and more significantly, he concentrated on the absolute idealism of Georg Wilhelm Friedrich Hegel. In 1840 Bakunin went to Berlin, intending to advance his academic career. Ultimately, however, he became politically radicalized in Prussia (and subsequently Saxony) under the influence of the so-called Young Hegelians, a group of philosophers who interpreted Hegel's philosophy in an unorthodox and theologically and politically left-wing fashion. This group included Marx, Friedrich Engels, and other lesser historical lights such as Bruno Bauer, Ludwig Feuerbach, and Arnold Ruge. The most striking expression of Bakunin's radicalism

from this period was “The Reaction in Germany” (1842), an article in which he advocated the revolutionary overthrow of existing social conditions by the poor in the name of democracy and freedom.

Faced with increased repression, numerous German radicals of this period gravitated toward Switzerland and France. Bakunin arrived in Paris, via Switzerland, in early 1844. There he met the two major influences on the development of his mature political theory, Marx and Proudhon, the French socialist and early anarchist. During the Revolutions of 1848 Bakunin engaged in revolutionary activity in central Europe: in Breslau, Prague, and finally, Dresden. Between Prague and Dresden, he wrote his next significant work, “An Appeal to the Slavs” (1848), in which he supported pan-Slavic revolution and a federation of European republics.

Imprisoned by Saxon and Austrian authorities for his revolutionary activities, Bakunin was returned to Russia after two years to spend the next six years in prison and the remainder of his life in Siberian exile. However, he contrived to escape in mid-1861, traveling to England through Japan and the United States. In London, Bakunin reacquainted himself with Marx but spurned his invitation to join the First International in 1864, preferring to move to Italy in search of revolutionary activity. It was during his three years there that Bakunin first formulated his anarchist theory, which was initially outlined in his influential “Revolutionary Catechism” (1866). In Italy, he also established a number of secret revolutionary organizations of rather limited impact and much debated intent.

Bakunin spent most of the remainder of his life, from mid-1867, in Switzerland, penning his major theoretical works of anarchism there. From his Swiss base, he also attempted to propagate anarchist ideas within the organized socialist movement, having been admitted to the First International in 1868. This effort led to significant hostility from Marx and his followers, who responded by publicly questioning both Bakunin’s commitment to internationalism (accusing him of being a pan-Slavist as he had been some years earlier) and his commitment to social revolution (accusing of him of advocating terrorism, owing to his controversial association with Sergei Nechaev, the young Russian nihilist). In spite of these accusations, Bakunin’s form of anarchism was gaining supporters, not

least in the southern European sections of the First International. Owing to such ideological divisions and hostilities, as well as prevailing political conditions after the defeat of the Paris Commune in 1871, the First International effectively collapsed at the Hague congress in 1872, when Marx and Engels engineered Bakunin's expulsion from the organization and had its General Council transferred from London to New York. The First International officially ended in 1876.

Aside from his involvement in a failed popular uprising in Lyon in late 1870 and an aborted attempt to participate in an insurrection in Bologna in mid-1874, Bakunin spent most of his final years in increasingly bitter dispute with Marxist opponents and in coping with health and financial problems. He died in Bern on July 1, 1876.

Political Thought

In addition to numerous shorter writings, Bakunin developed his mature political theory in three principal works: *Federalism, Socialism, and Anti-Theologism* (1867), *The Knouto-Germanic Empire and the Social Revolution* (1870–72), and *Statism and Anarchy* (1873). (To date, only the third of these works has been adequately translated into English; see Bakunin [1873] 1990.) Among these works, the longest and most important, certainly from a strictly theoretical perspective, is the unfinished *Knouto-Germanic Empire*, written during the Franco-Prussian War, the Paris Commune, the collapse of the First International, and the aftermath of these events. Unpublished during Bakunin's lifetime, this work is composed of two parts, two substantial appendices, a preface and lengthy note to the second part, and various other fragments. As such composition would suggest, it is imperfectly constructed and generally unpolished. Nevertheless, the *Knouto-Germanic Empire* contains the best overall statement of Bakunin's position on three basic theoretical themes, all of which had been introduced in *Federalism, Socialism, and Anti-Theologism*; the first theme is critical, the second is constructive, and the third is transformative. The critical theme is the analysis of the state as a fundamental, perhaps the fundamental, feature of the existing social order. Its constructive theme is the negative characterization of anarchy as an alternative social order. And its transformative theme is the nature of a

social revolution that might bring about this alternative social order. In expounding upon all of these themes, Bakunin develops a social theory that contrasts markedly with that of Marx, though it is nevertheless heavily indebted to him. Bakunin's opposition to Marx is explicitly spelt out in *Knouto-Germanic Empire* in the second appendix, which is appropriately titled "An Essay against Marx" (1872). The criticisms contained in this appendix are elaborated—for the benefit of a Russian-speaking readership—in Bakunin's last major work, the aforementioned *Statism and Anarchy*.

On the critical side, then, Bakunin offers a definition, explanation, and evaluation of the state. The state is, he claims, a particular political form that society takes at a given moment in human history: a moment, crucially, that he takes to predate capitalism. He insists that it is not only a transitory rather than a permanent form, but also a form that is necessary for the development of human history to the present. Thus, it can be said to be a "*historically* necessary evil" but not a "necessary evil" for the very existence of social order, as certain liberals might argue. (What makes it evil will come into view shortly.) Historically speaking, Bakunin claims that the state was founded by violence and conquest. Indeed, a necessary condition for its continued existence is force or coercion under the threat of force. However, Bakunin acknowledges that force is not a sufficient condition for its continued existence, nor is it what he represents as the Machiavellian wisdom of those who control the state. Another necessary condition for the continued existence of the state is a particular kind of belief on the part of its subjects: namely, belief in its authority or belief that its imposed influence is rightful. What largely interests Bakunin in the *Knouto-Germanic Empire* is the origin of such belief. Thus, what he offers is a genetico-critical examination of political authority, specifically that of the state. He argues that the state's authority—or the belief of its subjects in its authority—derives from religious and other similar systems of idealistic belief. He traces a historical line of development from religious belief in God, which represents the principle of absolute authority, through the institutionalization of religious belief in the church, which represents the principle of spiritual authority, to the politicization of society in the state, which represents the principle of temporal authority. Ultimately, he claims that the state could not exist, could not have arisen in human history, without religion—that is, without the moral sanction for its violence and

coercion provided by God, either directly, as in Protestantism, or indirectly, as in Catholicism. What the Reformation represented from this point of view was a challenge to the intermediate element, the church, such that the temporal authority of the state subsequently derived directly from God. The Enlightenment, by contrast, undermined religious belief itself and consequently the very principle of authority. Bakunin notes that it has, therefore, become increasingly difficult in the wake of the Enlightenment to defend authority in the absence of an absolute foundation or God, though modern political theorists still attempt to do so, albeit in more limited or more liberal forms and in the name of other, less secure idealistic abstractions such as the public interest and political freedom.

Assuming that the persistence of the state is based, in part, on the unfortunate beliefs—on the ignorance—of its subjects, one might wonder what social purpose the state serves. Is the state's supposedly rightful violence and coercion merely for the sake of violence and coercion? Not according to Bakunin, who maintains that the inherently violent state continues to exist so as to guarantee the ongoing exploitation of one part of society by another. The contemporary state, the state in the postrevolutionary period in Europe, guarantees the ongoing exploitation of the proletariat and the peasantry by the bourgeoisie. The contemporary state, though not the state as such, is therefore a reflection of social relations under capitalism. It constitutes the violent and coercive oppression of the proletariat and the peasantry by the bourgeoisie on behalf of exploitative interests and generally through its parliamentary representatives. A challenge to the state would constitute a challenge not only to political oppression but also to the economic exploitation that this political oppression guarantees: this political-economic link is the sense in which Bakunin's anarchism is socialist.

The typical reaction to Bakunin's criticism of the oppressive state is to say that there are or might be other less oppressive, more representative, more rational, and more humane forms of state, as for example in liberal democracies or scientific socialisms. But Bakunin asserts a basic anarchist principle of the formal equivalence of states. Whether a state is a monarchy or a republic, an aristocracy or a democracy, permanent or transitional, it remains a state—that is, by definition for Bakunin, a violent and coercive

institution that gives one part of society the opportunity to oppress and exploit another part of society and that depends on the ignorance of the oppressed in order for it to survive. The state is, therefore, an institution that opposes both freedom and rationality, that frustrates the human capacities for both creative action and critical reflection, and that therefore prevents human happiness. Thus the state is fundamentally unjust.

On ethical grounds, Bakunin's anarchism rejects not only the state, but also external authority of which the political authority of the state is only the most important example. External authority is a form of influence or social power that is imposed by one party on another party and that is recognized as rightful by the other party. Social relations of this authoritative kind are, according to Bakunin, unfree and irrational and therefore ethically unacceptable. However, Bakunin's anarchism does not reject natural authority such as that of the theoretical or technical expert, which is ethically defensible. The natural authority of one party may be freely accepted by another party but remains subject to its critical judgment. Such authority is genuinely consensual and temporary. Social relations of this authoritative kind are, according to Bakunin, free and rational and therefore ethically acceptable.

On the constructive side, Bakunin has somewhat less to say in the *Knouto-Germanic Empire*. His remarks on an alternative anarchist society comprise some relatively abstract ethico-political claims about the nature of freedom in such a society, as well as some more concrete, though still rather general, socioeconomic claims about anarchy. Bakunin also claims that anarchy is a social condition of individual freedom—that is, a society in which individuals realize their freedom in solidarity and equality with other individuals. There are, he adds, three aspects of the realization of such freedom, the first of which is positive, the second and third of which are negative. The positive aspect is the full exercise and cultivation of all human capacities by all members of society through education, science, and material well-being, social conditions that require individual and collective labor, both physical and intellectual. The first negative aspect is the rejection of those superstitious, religious, and idealistic beliefs that constitute the basis of external authority, both spiritual and temporal. Such rejection is required in order to secure human rationality. The second

negative aspect is the rejection of external authority as such, especially the political authority of the state. This rejection is required in order to secure a minimum of human freedom.

While Bakunin's more concrete socioeconomic claims are substantiated to some degree in his programmatic writings of the same period, he is generally reluctant to speculate on the form that the future society might take, regarding such speculation as unscientific, overly prescriptive, and therefore restrictive of the freedom of those who are to shape the society according to the needs of their time and place. From his "scientific" perspective, the most that can be said of a desirable future social order is what it will not be like, and this negative vision by known facts about the present social order and by our judgments of their undesirability. So if x is the case in our society, and x is judged to be undesirable, then all other things being equal, x will not be the case in the desirable society of the future. Given that existing society is oppressive and exploitative, organized from the top down by the state and marked by private ownership of the means of production, wage slavery, and class conflict, we can at least claim that the desirable future social order will not be any of these things. To put the same point in somewhat more speculative terms, an anarchist society would be stateless and socialist, organized from the bottom up by workers who federate into unions, communes, regions, nations, and ultimately global society, and marked by collective ownership of the means of production, voluntary labor, and classlessness.

On the transformative side, finally, Bakunin makes at least three claims in the *Knouto-Germanic Empire* that distinguish his position from that of Marx: first, with respect to the objective of social revolution; second, with respect to the possibility of social revolution; and third, with respect to the agents of social revolution. The objective of Bakunin's anarchist social revolution differs from that of Marx primarily in terms of its statelessness, though it may also differ to a lesser degree in terms of distributive principles that are collectivist rather than communist, and based upon effort rather than need. In other words, Bakunin believes that a social revolution requires the abolition of the state, not the proletarian conquest of political power to establish a transitional dictatorship. Indeed, the latter is no social revolution at all, according to Bakunin: it is a mere political revolution or

transfer of political power from the bourgeoisie to the proletariat, a transfer that still gives one part of society the corrupting opportunity to oppress and exploit another part.

Regarding the possibility of social revolution, Bakunin maintains that two conditions are necessary, and together seemingly sufficient. The first of these conditions is the reality of objective sociohistorical circumstances: social revolution cannot occur without a given material basis, without a certain level of economic and perhaps political development within a society that is divided along lines of class. It cannot occur by a mere act of will. However, Bakunin disagrees with a view that he falsely attributes to Marx that the subjective condition is irrelevant. The second necessary condition for social revolution is, Bakunin maintains, the reality of a revolutionary will: social revolution cannot occur without the sincere desire of a particular class to transform a society seen as unjust. This revolutionary will is the expression of a will that is largely though not entirely determined by social circumstances. Thus, Bakunin argues for a relative, not absolute, freedom of will and moral responsibility.

For Marx, the main agents of social revolution are the proletariat, the class of urban, industrial workers. By contrast, Bakunin believes that two other classes have a revolutionary role to play: the peasantry, the class of rural, small-scale land owners and laborers, and the lumpenproletariat, the underclass of beggars, criminals, and the unemployed or even the unemployable. The unemployables have revolutionary potential because they have no vested interest whatsoever in maintaining the existing social order and potentially everything to gain through fundamental social change. The peasantry, by contrast, may appear to have a vested interest in maintaining the existing social order: it has something to lose through fundamental social change, namely, the right to its private property in land, as well as the moral respectability that goes with ownership in capitalist society. However, Bakunin argues, the peasantry is in fact sinking into the proletariat and therefore stands to gain much from fundamental social change.

Though elements of Bakunin's political theory—arguably including his class analysis—are time-specific and arguably applicable only to

nineteenth-century European society, other elements—including his critical analysis of the state and his constructive ideas on federalism—have remained relevant to those with a theoretical and practical interest in non-Marxist forms of socialism.

Barrès, Maurice

Along with Charles Maurras (1868–1952), Maurice Barrès (1862–1923) was one of the major theoreticians of contemporary French nationalism. He was an aggressively engaged political journalist (from *La Cocarde* to *Figaro* and later *l'Echo de Paris*): elected to the Chamber of Deputies for the first time in 1889 (then from 1906 to 1923) and established as a political leader when he succeeded Paul Déroulède as president of the League of Patriots on July 10, 1914. His relationship to the political is a key indicator to understanding his life; however, neither that relationship nor his relationship to nationalism can fully capture it.

Barrès was first and foremost a writer. Using literature, he quickly established himself as an authority figure and was deemed the “prince of youth” by his contemporaries, despite the fact that he had not yet reached the age of thirty. Singled out after his first review *Les Taches d'encre*, he was best known as the author of the three-volume series *Culte du moi*, published between 1888 and 1891 (1994). This series earned him a following among the youth of his time and literary recognition among his peers and critics. Barrès was at the vanguard of literature, but he also maintained a desire to shape his own identity: the “I” is key in Barrès’s work. Alongside his literary debut, Barrès launched into political combat at a time when nationalism was personified by the figure of General Georges Boulanger, the War Minister who was further distancing himself from a Third Republic whose foreign policy he judged far too timid.

Barrès the Lorrainer, born in Charmes in the south of Nancy, was an ardent supporter of nationalist efforts to regain Alsace Lorraine, lost to Germany in the Treaty of Frankfurt following the Franco-Prussian War, and he rejected the Third Republic's parliamentarism. Anxious to find a path toward the synthesis of nationalism and socialism, he embodied what Zeev Sternhell has called the "revolutionary right." This stage of national socialism was essential to Barrès's work and extends beyond the Boulangist episode. Indeed, Barrès marked nationalism with a style of writing that could be considered lampoonist at times, most notably during the scandals that arose in connection with French involvement in the financing of the Panama Canal. At the same time, he was intent on elaborating an ideological synthesis by launching the newspaper *La Cocarde*, which attracted socialists and a young up-and-comer, Charles Maurras.

The Dreyfus Affair, in which a Jewish French officer was falsely convicted of spying for Germany, was another key moment in Barrès's trajectory. Like all nationalists, he was fiercely hostile to both Dreyfus and his supporters, while simultaneously exalting the role and the necessity of the army. At the turn of the twentieth century, Barrès's literary corpus emerged as nationalist through a new series, *Le Roman de l'énergie nationale*, of which the first volume was titled *Les Déracinés*. Through his Lorraine roots and the sacred hill, Barrès glorified the earth and the dead and decried the decadence that was threatening France.

A dedicated writer who was elected to the Académie française in 1906, Barrès was at the forefront of the nationalist struggles of his time, many of which were recounted in a weighty tome, *Scènes et doctrines du nationalisme*. While Barrès was a close and faithful friend to Maurras, he did not follow when Maurras and Action Française proclaimed the need to bring down the Republic in order to reestablish the monarchy. Barrès loathed parliamentarism and its abuses, denouncing with particular virulence the corruption scandals of his time (he published *Dans le cloaque* about the Rochette affair, in which French officials were charged with complicity in fraud committed by M. Rochette); nevertheless, he remained a son of the French Revolution, campaigning for a Republic tinged with Caesarism and Bonapartism.

The Barrès of pre–World War I did not budge on revenge nationalism and wrote a trilogy titled *Les Bastions de l’Est*. During the war, Barrès was a strong proponent of the Union sacrée and of the coalition. If he had hated pacifists accused of treason, the anti-Dreyfusard now gave special prominence to Jews in his work *Les diverses familles spirituelles de la France*. Times had changed, and henceforth Barrès would combine nationalism, conservatism, and notabilization. A striking figure of the French political and cultural landscape, well known and influential outside of France—even if it was more for his literary works than his political texts—Barrès remained a solitary man. Unlike Maurras, he did not seek disciples or to create a following. Shortly after his death, Henri de Montherlant remarked, “Barrès is slipping away.” This observation is accurate and refers to his broader lack of posterity—even if some of his books have been republished, and even if he figures prominently in the history of French nationalism.

Bauer, Bruno

Bauer, Bruno

Bruno Bauer (born in Eisenberg, Thuringia, 1809; died in Berlin, 1882) was a student of Georg Wilhelm Friedrich Hegel, a leader of the Young Hegelians before the Revolutions of 1848, and a theologian, historian, and philosopher. His major works include *Critique of the Synoptic Gospels* (3 vols., 1841–42); anonymously, the mock-pietistic *Trumpet of the Last Judgement upon Hegel, Atheist and Antichrist* (1841); *Christianity Revealed* (1843); and multivolume histories of the French Revolution. In 1842, he was dismissed from the University of Bonn, allegedly for religious heterodoxy but directly on the order of the Prussian king Friedrich Wilhelm IV for public criticisms of the regime.

In his theological investigations, Bauer concluded that the gospel accounts were purely fictitious, and he denied the historical existence of Jesus. Bauer criticized Christianity on theoretical and historical grounds, seeing it as a product of alienated consciousness and a support for oppressive, irrational political institutions. In his historical works on the Enlightenment and French Revolution, Bauer examined the transitions from the old social order of estates to more individualistic modern civil society. While he viewed this development as necessary and progressive, he also warned of its dangers: the emergence of conformist mass society. His philosophical reflections before 1848 focused on concepts of freedom. He drew republican conclusions from Hegel's theory of the state and criticized vacillations in Hegel's own account of sovereignty. His position conflicted with leading liberal and democratic views, however, when in 1843, he opposed the

emancipation of Prussian Jews as a mere defense of particular interests. He was the object of Karl Marx's polemics in the *Holy Family* and the *German Ideology*. Max Stirner's *The Ego and His Own* (1845) was largely a critique of Bauer's republican humanism. After 1848, Bauer became a theorist of emergent world imperialism.

Revising Hegel's conception of Absolute Spirit, Bauer saw art as closer to philosophy than religion. Both art and philosophy manifested the creative power of the human spirit to transform the objective world in light of ideas while religion was an expression of passivity and alienation. Unlike Enlightenment atheism, which described religion as mere duplicity, Bauer saw religious alienation as a historically necessary, though now obsolete, step toward full human self-determination. The Christian idea of the unity of God and man conveyed an essential historical truth: individuals were capable of rational freedom, progressively transforming themselves and their world. But Christianity distorted this idea, projecting a separate heavenly realm where universal and particular, God and man, were reconciled. Far from correcting the egoism of human life, this idea of transcendent divinity confirmed it. When the universality of human consciousness was projected into an otherworldly beyond, its residue was a merely particularistic understanding of freedom as exclusively private interest. Religion and political absolutism were mutually sustaining forms of alienation. Bauer's alternative, before 1848, was a republican state based on universal self-consciousness: the capacity of individuals to realize general interests in their own activities, rather than acting on narrowly defined utility or self-interest, and to disavow immediate interests and identities wherever these conflicted with higher, self-determined aims. Bauer's opposition to Jewish emancipation arose from his critique of particularism. The explicitly Christian state of Restoration Prussia could not emancipate its Jewish subjects without undermining its own foundation; and the Jews were seen to be demanding freedom on the basis of their private religious identity. The genuine solution was the mutual renunciation of religion.

In his 1843 critique of Hegel's *Philosophy of Right*, Marx modified Bauer's analysis of alienation, arguing that even republican states were false universals sustaining egoism in social life. The solution was to transform

economic relations themselves. Bauer, however, rejected socialism as the advocacy of particular interests. In 1848, he defended popular sovereignty and the right to revolution, demanding that a new constitution be promulgated as an act of revolutionary will, not as a concession from the king.

While denying that his thinking changed, Bauer abandoned republicanism after the failure of 1848. He predicted global imperialism, the rise of Russia, European union, and inevitable world war. He did not endorse Bismarckian absolutism, but anticipating Friedrich Nietzsche, saw in the impending collapse of Europe's prospects for a cultural renaissance, freed from traditional values and religion. Some Nazi authors claimed him as a precursor because of anti-Semitism in his late writings, though he was never a German nationalist. The socialist Karl Kautsky developed Bauer's views on imperialism into a more optimistic conception of a peaceful world order. Friedrich Engels praised Bauer's theoretical contributions to the socialist critique of religion. Along with his early republican, theological, and historical reflections, Bauer's heritage is thus contradictory and complex.

Bebel, August

No other individual was as effective a proponent of Marxian socialism during the late 1800s as August Bebel (1840–1913). Widely popular within the German labor movement, his public engagements typically drew overflow audiences, and his major publications were reprinted each time they sold out. Bebel's most original contribution to socialist theory centered on his writings about women's equality. His involvement with this issue began in the mid-1860s, around the same time as his participation in the socialist movement. From this point forward, he became a tireless advocate for women, mostly with considerable support from within the socialist movement itself. His book *Women and Socialism* ([1885] 1988) was widely reproduced. With over fifty reprintings in Germany alone that comprised eight separate editions, it ultimately tripled in length. The book was also translated into twenty other languages during Bebel's lifetime. In other words, virtually every country or linguistic enclave that had a socialist movement also had a version of his book for its supporters to read and learn from.

Bebel was raised in a small town in the western part of Germany. His formal education ended at age 14 when he was apprenticed as a woodworker. Bebel was drawn into the socialist movement reluctantly, but once convinced of its goals and doctrines, he dedicated much of his adult life to its success. At first, he belonged to the Leipzig Worker Educational Association, one of the many self-help groups that formed during the 1850s and 1860s. The association focused on practical skills and core knowledge,

such as public speaking, note taking, and mathematics, and on leisure-time activities such as hiking and gymnastics.

These all-male and apolitical groups were places of discussion and controversy. Their radical members were intent on jettisoning the educational focus for a real involvement in political matters, a transformation that Bebel resisted at first. Not until he was introduced to Marxian socialism by the freelance journalist and agitator Wilhelm Liebknecht did Bebel perceive a means to combine education and emancipation into a single philosophy. Marxian socialism appealed to him because it confirmed rather than criticized the activities of which he was already a part.

Marxism quickly became known for its fierce independence and its refusal to cooperate with groups from outside the working class. It was also highly political, with a strong focus on elections and governmental power. This combination of traits attracted Bebel at a time when the modern labor movement in continental Europe was just forming. In the next few years in Germany, the radical wing of the workers' movement (the so-called Lassalleans, after their lead theorist, orator, and organizer, Ferdinand Lassalle) was absorbed into the Marxian socialist movement, as the latter proved to be more consistent in its activities and better able to attract support within working-class circles.

The Socialist Movement

Bebel became well known not only within the German labor movement, but also by the population at large. By 1877, the German socialists (or Social Democrats—the official title of the party was the German Social Democratic Party) polled nearly 10 percent of the national electorate. With a membership of 35,000 and publishing over forty newspapers, including thirteen dailies, the socialists were a formidable force. Membership in the party and in the affiliated socialist unions was entirely voluntary. There were no automatic paycheck deductions in an era when everyone was paid in cash. Dues collections took place at neighborhood pubs, at regularly scheduled meetings, or in the case of the unions, in unauthorized campaigns at the workplace.

So successful had the Social Democrats been during their first decade of existence that the government banned the party in 1878. The repression was intense. Bebel had spent several years in jail during the 1870s, and these stays were now followed by two additional stints during the 1880s.

Altogether he would spend four and one-half years in prison for matters such as insulting the monarch, distributing unapproved leaflets, denouncing militarism, and treason. During the twelve years of the Anti-Socialist Laws, hundreds of socialist groups were banned, publications forbidden or seized, and additional hundreds of individuals exiled or jailed, all while the movement led an underground and shadowy existence. Bebel was compelled to leave his residence in the city of Leipzig and move to its suburbs, although many others needed to flee the country altogether.

Loopholes in the Anti-Socialist Laws, however, allowed individual socialists to campaign for office, Bebel among them. Election to a governmental body also meant that speeches and proclamations given within official chambers could be reprinted and distributed as campaign literature, another feature that played to Bebel's strengths. The repressive legislation seemed to have the opposite effect from what was intended. By 1890, the party had doubled in size and now polled 20 percent of the electorate. Because of another quirk in the electoral rules, Bebel was often a candidate in multiple districts, especially in those where a strong local candidate and party organization had yet to emerge.

What were the main tenets of socialist doctrine that Bebel so thoroughly identified with? Foremost among them was the transformation of private property into collective custody. By private property, the socialists meant not so much items used for individual consumption and well-being (although in the case of the rich, these too were an issue), but the resources used to produce commodities. The target of their socialization plans were natural resources such as agricultural land and mines and productive equipment such as machinery, factory buildings, transportation facilities, and the like. In other words, anything that people either depended on or used in common would be removed from the control of individuals and small groups. A thoroughgoing democratization in all areas of society would take its place.

Naturally, the socialists favored a redistribution of wealth from the rich toward the poor, with a special emphasis on the elimination of inequalities. They opposed all forms of discrimination. The freedoms of speech, assembly, and organization were vital, and they also advocated the freedom of religious choice and practice. Free and universal education, the right to legal counsel, a progressive taxation system, shorter workdays with regular time off, the abolition of child labor, restrictive provisions for work that was potentially dangerous to one's health, elected workplace inspectors, a rigorous system of public health measures, public oversight of insurance companies, the abolition of the monarchy and other forms of hereditary rule, and the equal and secret ballot were what they strove for. Some of these ideas, of course, are now recognizable as part of the liberal state. But the socialists were forerunners in their endeavors to reform the modern world, and much of their platform still remains unfulfilled, or fulfilled in a less than satisfactory manner.

Women and Socialism

Bebel's physical appearance belied the great power of his words. Slight in appearance and standing only five feet six inches in height, he would sometimes talk for several consecutive hours in large meeting halls abuzz with commentary called out from the audience and a great flow of people into and out of the room. Bebel also wrote in a manner similar to his speaking style, a dialogic method in which the mode of communication was as important as the content of his ideas. Whether speaking or writing, he always attempted to engage the audience as if in conversation. This ability to articulate what many were thinking and explain what many questioned accounts for his great popularity. He was the conduit for the spread of socialist ideas among the German proletariat, many of whom identified with his humble background and greatly appreciated his efforts to explain the fundamentals of socialist doctrine to them in terms readily understandable.

Particularly noteworthy was Bebel's sponsorship and encouragement of women colleagues. The socialist movement, though, was overwhelmingly male, in part because women were legally banned from political participation, even at lectures, in most parts of Germany. The movement recruited its members from the skilled crafts and from heavy industry, both

of which were areas where women were excluded from employment. Bebel had been an organizer in the late 1860s of a workplace union in the textile industry that recruited male and female members. This experience may have been the first union anywhere to operate in such a fashion. Textiles at that time were produced in an array of places that included sizable factories, small workshops, and the so-called cottage industry where adults and children worked at home in ad hoc arrangements and great poverty. The union-affiliated insurance companies provided benefits for childbirth and other gynecological conditions, another pioneering practice by the fledgling socialist movement. But the textile industry was an exception to the general pattern of paid labor, which was oriented on men.

A significant part of the German working class supported the drive for women's equality. Within the socialist milieu, several hundreds of thousands of men espoused women's legal and political equality, sponsored special elections to ensure female representatives, and funded all-women's newspapers and publications. Feminism was as much a men's as it was a women's issue. Socialist men were often quite expansive in their understanding of women's equality. In this they took their lead from Bebel, whose *Women and Socialism* discussed the plight of women from a broad array of political, economic, sociological, and psychological perspectives. The list of topics that he covered was encyclopedic in scope: fertility rates, sex-segregated occupations, morality and romance, male theories of women, job discrimination, collective households, equal rights and equal pay, and much more. Especially risqué were his frank and open comments about sexuality.

Bebel's book found an avid readership among working-class and middle-class women and among working-class men. *Women and Socialism* was clearly one of the most widely distributed socialist books of the pre-World War I era. For many, it was the conduit into the socialist movement. Feminist activists often attributed their own political development to Bebel's influence. That he portrayed women as acting on their own behalf despite a societal system based on class and gender inequalities was one of the book's most appealing features, a trait quite exceptional for the era in which it was written. Within the socialist movement, *Women and Socialism* was considered the most authoritative book on women's equality, far

eclipsing in importance and recognition Friedrich Engels's *The Origin of the Family, Private Property and the State*.

Women and Socialism was also a book full of quirks, some deriving from Bebel's odd writing habits, some from the book's translators. The first edition was a long, 180-page pamphlet that was published without chapter or section headings, an indication of Bebel's initial lack of familiarity with literary traditions. Subsequent editions were translated into English on three separate occasions during his lifetime, and each time the translators introduced sex-specific language into the text even though Bebel had been conscientious about avoiding it. Where Bebel referred to humankind, the translators substituted mankind.

But for all its organizational and idiosyncratic problems, *Women and Socialism* remained a book known for its bold discussions of everyday life. Bebel's advocacy in the Reichstag of women's right to initiate divorce proceedings was reflected in his book with passages on the economic hardships that faced single-headed households. His calls for the decriminalization of homosexuality were not openly endorsed by his own party, despite the many internal debates his stance prompted. A prolific writer of articles, pamphlets, speeches, and reports on a wide-range of current events and controversies, Bebel had a major impact on the activities and doctrines of the socialist movement.

Socialism at Its Limits

By the early 1900s, the socialist movement had begun to push against its own limitations. Industrial expansion had led to tremendous gains in productivity, and these gains translated into cheaper consumer goods—an era of deflation—from which the working class benefited. The economy was still highly volatile, with all the inequalities and instability of previous decades, but there was a sense of complacency and even satisfaction that mixed with all the other sentiments about the existing order of things. The more successful the socialist movement's organizations became, the more cautious they grew. With full-time employees in the party and affiliated unions now numbering in the thousands, there was a layer of the movement that derived its livelihood from its continued existence. The movement also

began to attract talented individuals, some of whom were university educated, from the lower middle and professional classes who shared a socialist perspective. Cast into the role of an elder statesman, Bebel's role in the party's parliamentary faction and his position as cochair of the entire party organization were accompanied by a certain marginalization.

Meantime, each national and regional election was scrutinized intensely by Bebel and his colleagues to determine if adjustments in tactics, rhetoric, and policy were necessary to secure votes and ensure success at the polls since this aspect was deemed essential to the forward progress of the entire movement. By 1912, the year before Bebel's death, the Social Democratic Party was the largest and most successful political organization in Germany. It counted one million members, with two and one-half million in socialist-affiliated unions. Party candidates had received one-third of the popular vote in the national elections, and one-fourth of all Reichstag representatives were now socialists. In the capital city of Berlin, a full three-fourths of the electorate voted socialist.

Despite these achievements, the party found itself in a quandary. On the one hand, it had never been more successful. Yet it was also clear that there was not much room for further growth within the electoral system. The Social Democrats would never achieve governmental power based on the working-class electorate alone, and this realization split the party into left- and right-wing factions. The left emphasized the revolutionary traditions of the socialist movement, whereas the right hoped to tone down these aspects in order to attract adherents from within the middle classes. Bebel tried to bridge this gap, but events outpaced his ability to forge a consensus. Increasingly he and others from the leadership of the Social Democratic Party combined a radical rhetoric aimed at the left with a conciliatory stance toward the right that allowed the latter to do as it pleased. This temporary strategy was bound to fall apart as soon as the party came under increased pressure—precisely what occurred during World War I when the party split into separate pro- and antiwar organizations.

The synthesis forged by Bebel and his colleagues masked other confusions as well, particularly about the future. The party had never defined what it meant by “socialization of the means of production.” Many understood

socialism as government ownership rather than direct control by the employees. The debate over state socialism versus workers' councils that unfolded in the years immediately following his death similarly divided the movement. Bebel's socialism, with its attempted amalgamation of the left with the right, did not outlive him. His influence on the socialist movement vanished almost overnight. To the socialists of the twentieth century, he came to represent a bygone era, a feature that helps explain why he is often remembered in nostalgic terms by commentators at both ends of the political spectrum. Nonetheless, he had represented something fundamental and important about how the socialists hoped to refashion a competitive into a truly humane world. It is this optimistic view of promise and possibility that makes Bebel still worth knowing about.

Bellamy, Edward

Edward Bellamy (1850–98), a journalist and novelist living in Massachusetts, was almost single-handedly responsible for detonating the explosion of utopian thought that reshaped the political imagination, in both Europe and the United States, at the end of the nineteenth century. *Looking Backward, 2000–1887* ([1888] 2007), his most significant and successful book, was a political romance that featured a nineteenth-century Bostonian who, like Rip Van Winkle, falls into a catatonic sleep from which he reappears more than a hundred years later only after an epochal historical change has taken place. Inside this romantic frame, Bellamy soberly set out a detailed reformist vision of a state-socialist society. He characterized this species of postcapitalist society as Nationalist because it was premised on the conviction that, in order to overcome the contradictions of a competitive commercial system, the nation had to evolve into a single monopolistic corporation democratically responsible for all the forms of production and consumption. Shortly before his death, Bellamy embroidered these ideas in a sequel, *Equality* (1897).

The phenomenal impact of *Looking Backward* can be measured by the fact that, after *Uncle Tom's Cabin* (1852), it became the second novel published in the United States to sell a million copies. At a time of pervasive, sometimes apocalyptic fears about the future of capitalism, when capitalists were panicking and socialists were agitating, its popularity transformed utopian fiction into a viable, indeed almost mandatory, medium for political debate. It has been estimated that *Looking Backward* directly precipitated

the publication of at least sixty-two utopian novels between 1889 and 1900 (the most celebrated of these is no doubt William Morris's anarchistic utopian counterblast, *News from Nowhere* [1891]). The novelist Leo Tolstoy, who commissioned a Russian translation, was representative of the book's first readers when, in the summer of 1889, he noted in his journal, "*Looking Backward* is superb."

But the book also had practical political effects: it inspired a rapidly expanding network of local clubs and societies that disseminated Bellamy's reformist ideas through lectures, pamphlets, and periodicals, attracting in particular those sections of the middle class that felt disconcerted both by capitalism and by the promise or threat of socialism (the latter, Bellamy commented in a letter to W. D. Howells, "Smells to the average American of petroleum, suggests the red flag, with all manner of sexual novelties, and an abusive tone about God and religion"; quoted in Lipow 1982, 22). In the U.S. presidential election of 1892, these so-called Nationalist societies campaigned for the Populists, who adopted a number of Bellamy's recommendations, and whose candidate, General James B. Weaver, polled almost a million votes. Although the direct impact of Bellamy's ideas faded at the end of the century, he continued to influence activists and thinkers; in the twentieth century, Eugene Debs, John Dewey, and Thorstein Veblen all testified to the seminal importance of *Looking Backward* for their own intellectual and political development.

Bellamy was brought up in Chicopee Falls, Massachusetts, the son of the Reverend Rufus King Bellamy, a Baptist clergyman, and Maria Putnam Bellamy, the daughter of a Baptist clergyman. In an autobiographical account from the mid-1890s, Bellamy insisted that the Chicopee Falls of his childhood had been an idyllic place, "where there were no very rich and very few poor, and everybody who was willing to work was sure of a fair living" (Bellamy 1937, 217). In fact, as the location of a cotton mill since 1810, Chicopee Falls had by the mid-nineteenth century become an important industrial center, one characterized by precisely the kind of social divisions that Bellamy's pastoral description of his childhood elides (in 1858, for instance, three hundred Irish laborers went on strike). This industrial landscape shapes the politics of *Looking Backward*, which center on the idea that socialist society will be the peaceful consequence of a

process of industrial evolution—unlike the violent revolutions predicted by socialists such as Morris and Karl Marx. So does his religious background, which informs the millenarian denunciations of capitalist society that attracted so many of the book's contemporary readers. For his part, Bellamy maintained that it was the visit he made to Europe in 1868 to 1869 that startled him into "a vivid realization of the inferno of poverty beneath our civilization," proving decisive for his developing political consciousness, increasingly evident in his journalism of the 1870s and 1880s.

In *Looking Backward*, Bellamy imagines that, after a century of gradual, peaceful change, the "industry and commerce" of the United States in 2000 is no longer run for profit by "a set of irresponsible corporations" in competition with one another; instead, the nation has become

the one capitalist in the place of all other capitalists, the sole employer, the final monopoly in which all previous and lesser monopolies were swallowed up, a monopoly in the profits and economics of which all citizens shared. (chap. 5)

Central to Bellamy's social blueprint is the idea of an industrial army, a labor force run with the regimental efficiency of "the German army in the time of Von Moltke." As this image implies, Bellamy's Nationalism had an authoritarian dimension, despite its egalitarian commitments, and this dimension proved distasteful to contemporaries such as Morris, who deplored its "machine life." From at least the 1930s, of course, the term Nationalism acquired even more authoritarian connotations, though ones that Bellamy could not have predicted, and these have inescapably accrued to *Looking Backward*, displacing its historical significance. But Erich Fromm, a thinker acutely conscious of the dangers of bureaucratic abstraction, was surely correct in his assessment in the foreword to *Looking Backward* ([1888] 1960) that it was "one of the most remarkable books ever published in America."

Bentham, Jeremy

Jeremy Bentham (1748–1832), the utilitarian legal philosopher and radical political reformer, was educated at Westminster School and Queen's College, Oxford, from which he obtained his BA in 1763 and MA in 1766. In November 1763, he entered Lincoln's Inn and listened to cases heard before Lord Mansfield in the Court of King's Bench, including the proceedings against John Wilkes. Although admitted to the bar in 1769, he chose to devote his life to applying scientific principles to the reform of English law. In later life, he remembered the year 1769 chiefly for his first reading of works by David Hume, Cesare Beccaria, and Claude Adrien Helvétius, from whom he gained an appreciation of the analytical potential of the concept of utility and an acute understanding of its protean characteristics as a foundational principle. Unaware that Francis Hutcheson had earlier voiced a version of "the greatest happiness of the greatest number" formula, he recalled that it was either in Beccaria or Joseph Priestley that he first saw the principle (it was almost certainly the former). Beccaria's enlightened views on the principles of law and punishment, together with Helvétius's suggestions for defining and analyzing moral terms, were important influences shaping Bentham's utilitarian moral and legal philosophy. In Hume's secular philosophy, Bentham found an impressive systematic approach to the rules of justice founded in general utility but was disappointed by Hume's moral-sense explanation of the psychology of moral conduct.

Writings

The first product of Bentham's project to critically analyze English law and set it on the new foundation of the principle of utility was *A Fragment on Government* (1776), a criticism of William Blackstone's Lockean statement of the contractual basis of government in *Commentaries on the Laws of England* (1765–69). He had heard Blackstone lecture at Oxford and detected certain fallacies in his natural-law reasoning. In *A Fragment*, Bentham developed this critical perspective further, offering as an alternative the fundamental axiom that "it is the greatest happiness of the greatest number that is the measure of right and wrong," and that "the obligation to minister to general happiness, was an obligation paramount to and inclusive of every other" ([1780] 1970, 393, 441n). This slim volume was a small part of a more substantial but unfinished work intended as a comprehensive critique of Blackstone's legal theory and defense of the "matchless" English constitution, but the larger work did not appear in print until the twentieth century, when it was published as *A Comment on the Commentaries*.

In 1780 (1970), Bentham printed but did not publish *An Introduction to the Principles of Morals and Legislation* (IPML), intended as an introduction to his planned *Pannomion*, or complete legal code based upon the utility principle. The Pannomion was designed to include works on civil and penal law, judicial procedure, constitutional law, international law, and political economy. The general purpose of this science of morals and legislation was "to rear the fabric of felicity by the hands of reason and of law" (Bentham [1780] 1970, 11). Out of the final chapter of IPML emerged another major work, *Of Laws in General*, written in 1782 and first published in 1945, in which Bentham methodically examines the sources, theory, and application of laws, and proposed a common standard by which comparisons of different legal systems could be made according to the principle of utility. Based on extracts from IPML and other writings and manuscripts on civil and penal law, Bentham's friend and disciple the Genevan Étienne Dumont published *Traité de législation civile et pénale* (1802), which brought his ideas to the attention of a much wider reading public in continental Europe. The *Traité* was later retranslated into English as *Theory of Legislation* (1840) by the American utilitarian Richard Hildreth.

Panopticon; or the Inspection-House (1791), based on an architectural idea of Bentham's brother Samuel, detailed plans for the construction of a prison (and other controlled institutions, such as poorhouses, factories, schools, hospitals and asylums) based on a circular design and centrally located watchtower. In *Discipline and Punish* (1974), Michel Foucault depicted the Panopticon as heralding the birth of the surveillance society. However, the idea for an easily controlled circular penitentiary was really a humanitarian advance on the disease-ridden hulks and other hellholes that passed for prisons in eighteenth-century England. After many fruitless years attempting to persuade the government to support the Panopticon plan, it was finally given up in 1812 when Bentham was paid £23,000 in compensation for the expenses he had incurred.

Much of the remaining years of the century and opening years of the new century were spent on issues related to economic and financial policy, poor-law reform, the rules of evidence, and other judicial practices. Bentham's political convictions during this period have been widely discussed. It is generally acknowledged that he developed utilitarian arguments for democratic institutions at the time of the French Revolution (including female suffrage), but turned away from parliamentary reform in the aftermath of the Terror. One view, as argued by British philosopher Philip Schofield (2006), is that it was Bentham's discovery of the concept of sinister interest in 1803—the prosecution of partial interests by those in authority contrary to the interests of the subject many—that brought him to publicly advocate democratic institutions. Others believe it was Bentham's meeting with James Mill in late 1808 that provided the catalyst that returned him to the democratic cause (for a classic summary, see John Rowland Dinwiddy's [1989] summary of Bentham's views). What is certain is that from this point forward, his politics became increasingly radical.

The second decade of the century was a period of prolific writing for Bentham, including works on education, ontology, language, logic, private ethics, and religion, as well as law and politics. In *Chrestomathia* (1815) he described a new system of education for the children of the middling and higher ranks in life. The curriculum was utilitarian in intent (chrestomathia meant useful learning) and stressed science and technology rather than the classics and religion. A second part was added in 1817. In the same year,

Bentham published his important treatise on motivation, *A Table of the Springs of Action*, in which he provided an exhaustive classification of the types of pleasures and pains. His major tract on politics of this time was *Plan of Parliamentary Reform, in the Form of a Catechism* (1817), in part based on manuscripts authored in 1809 to 1810. Bentham was now thoroughly convinced of the need for universal male suffrage (female suffrage was dropped from the reform agenda for tactical purposes), annual elections by secret ballot, the election of intellectually qualified independent members of parliament, a system of fines to ensure the regular attendance of representatives, accurate publication of parliamentary debates, and the elimination of royal patronage. Ultimately, a complete and efficient democracy would require the abolition of monarchy and a range of administrative and political devices to provide the people with securities against misrule. Without reform Bentham believed England risked a revolution. Closely related to his critique of the political establishment were his little-known but substantial criticisms of religious institutions, practices, and beliefs in *Church-of-Englandism and its Catechism Examined* (1818), *An Analysis of the Influence of Natural Religion on the Temporal Happiness of Mankind* (1822), and *Not Paul, but Jesus* (1823). In these works, Bentham brought his reasoning on logic, language, and ontology to bear with telling skepticism. At this point, Bentham was widely recognized as the foremost philosophical voice of political reform in Britain.

Bentham dedicated the last ten years of his life to the *Constitutional Code*, the final construct in the Pannomion to accompany the civil, penal, and procedural codes. He began work on the *Code* in 1822 after the Portuguese Cortes expressed interest in receiving drafts of constitutional and legal codes. Its 1830 title, however, directed it to “all nations and all governments professing liberal opinions.” Stimulated by the pace of political change in the Iberian Peninsula and in Greece, Bentham completed much of the design by 1824. Further sections were added during the next two years as his attention was captured by the emergence of new nations in South America, and the first of three volumes was completed in 1827. Elements of the *Code* were drafted under various titles and in various forms, such as *First Principles Preparatory to Constitutional Code*, *Securities against Misrule*, and *Official Aptitude Maximized: Expense Minimized*, and versions were offered or distributed in the newly liberated regions of

Central and South America, as well as in older societies in political transition in the Mediterranean basin and parts of Europe.

The only other major work published in the last phase of Bentham's life was *Rationale of Judicial Evidence, Specially Applied to English Practice* (1827), a five-volume treatise edited by the young John Stuart Mill. Bentham had been considering the subject for many years, making three different attempts to write on it between 1802 and 1812, and Pierre Étienne Louis Dumont had already published *Traité des Preuves Judiciaires* (1823) based on a selection of Bentham's speculations. The younger Mill was asked to merge and collate these disparate beginnings. On the usual basis that law should be based on utilitarian principles, Bentham carefully considered the problems inherent in the rules of evidence operating in the English courts and proposed remedies for them.

Utilitarian Theory

Bentham coined the term *utilitarian* in 1781 to describe his general analytic and practical approach to moral and legal philosophy. At that time, he considered *IPML* as the foundational text of his philosophy. At the base of the theory is the assumption of "the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do" (Bentham [1780] 1970, 11). For Bentham pleasure is itself a "good"; indeed, allowing for "immunity from pain," it is "the only good." Likewise, pain is itself an "evil," and "without exception, the only evil" (Bentham [1780] 1970, 100). Nor were these observations restricted to humans—his proposed penal code was to include a section on cruelty to animals. As he explained, "The question is not, Can they *reason*? Nor, can they *talk*? But, can they suffer?" (Bentham [1780] 1970, 283n). The relationship between happiness and pleasure and pain was straightforward and did not require further elaboration: pleasure contributes to happiness, while pain detracts from it. Pleasures and pains are the real entities of individual experience, acting both as the final cause of individual action and as the efficient cause and means to individual happiness.

The utility principle constituted the moral standard for the testing of existing law and for the innovation of new law. As a first principle used to

establish everything else, the principle was not itself subject to proof, but Bentham claimed there was sufficient testimony to the fact that it had always been generally accepted as the standard of right and wrong. The utility of the individual was a part of the public utility in which the individual shared, but one person's utility was just as important as another's. Thus, a person approved of an act or law (or ought to approve it) to the degree to which the happiness of all the individuals affected by it is advanced. In these terms the public interest is constituted of the aggregate of individual interests, construed in terms of the balance of pleasures and pains experienced by each person.

The anticipation of pleasure or pain provided the source for all motives to action, which Bentham divided into four sanctions, which he may have learnt from the Anglican moralist John Gay: physical, political, moral, and religious. These sanctions are available to the moralist and to the legislator in guiding and determining an individual's conduct, and explain how an essentially self-interested individual can be directed or encouraged to perform actions that enhance general happiness. In Bentham's theory of motives the dictates of utility were neither more nor less than the dictates of the most extensive and enlightened benevolence. Other motives were categorized either as semisocial motives (such as love of reputation, desire of amity, and religion), which may or may not coincide with the principle of utility, or purely self-regarding motives (such as physical desire, pecuniary interest, love of power, and self-preservation), which were the least likely to coincide with utility. All motives, including the most extensive benevolence, are rooted in self-interest.

While the consequences of an act are partly dependent on the motives that give birth to the act (and partly on the empirical circumstances in which the act is performed), for Bentham the utility of an act is not dependent on its originating motive(s). Utility is determined solely by its consequences, the advantages and/or disadvantages that result. When deciding whether to act or which act to perform, individuals must calculate as best they can the pleasures and pains that may reasonably be expected to accrue to the persons affected by the acts under consideration, including themselves. The value of pleasure and pain was constituted of the following elements: intensity, duration, certainty or uncertainty, propinquity or remoteness,

fecundity, purity, and extent. A similar calculation should guide the legislator in formulating laws. Though Bentham believed there was nothing in what he had proposed “but what the practice of mankind, wheresoever they have a clear view of their own interest, is perfectly conformable to,” it has often been said that applying the felicific calculus is impractical. Bentham himself recognized that neither the individual nor the legislator could strictly follow the process he had described. Rather he presented it as a model of the ideal calculation, and “as near as the process actually pursued on these occasions approaches to it, so near will such process approach to the character of an exact one” (Bentham [1780] 1970, 40).

We must also note that measure for measure Bentham did not generally consider pleasures to be commensurable with pains in value. The unhappiness created by the loss of something usually has a greater impact on a person than the happiness brought about by its gain to someone else. All other things being equal, the reduction of utility to one person caused by theft will have a greater bearing on that person’s happiness than the gain in utility to another person from a lottery win to the same value. Of course, if the loser is a wealthy person and the gainer a poor man, this standard will not hold. But in the normal run of things, this differential is why Bentham gave a high priority to the protection of property.

Though on occasion Bentham used money to illustrate the value of pleasures, he cautioned against a strict correlation between the two. While we might assume that of two individuals with unequal fortunes the richer of the two would be the happier, it does not follow that adding increments to that person’s wealth will continue to make him or her happier in the same proportion. It is in the nature of the case that the increase in happiness will not be as great as the increase in wealth; the addition of equal increments of money will bring successively less of an increase in happiness. Modern economists know this phenomenon as the law of diminishing marginal utility. One of its practical consequences for Bentham is that where choices present themselves between giving an additional increment to a rich man or to a poor man, in most instances more happiness will result from giving it to the poorer of the two. An argument in favor of a modest redistribution of wealth can be derived from this element of the theory.

The issue has been debated whether the utility principle is a parochial or universal standard. Though in his later constitutional writings Bentham sometimes substituted the terms *universal interest* for *the greatest happiness*, it is fair to say that he was neither a parochialist nor a universalist in any restrictive or absolute sense of these terms. At times he added to the injunction “pursue the greatest happiness” the words “of those affected by the action” or “of the community in question” or some other such phrase. His intention is that we should not consider only our own interest when contemplating action, nor that we should always bear in mind the happiness of the whole of humanity. Rather his intention was that when a person considers the utility of an action, he or she should take into account the impact of the action on the interests or well-being of those he or she knew were likely to be affected by that action. Where the action concerns only the individual, then that is the only interest to be considered. When legislators enact law, they have, or should have, the public interest in view, that is, the aggregate interest of the individuals that constitute the community. At his most universal, Bentham, who was responsible for introducing the word *international* into both the French and English languages, held that the object of international law is “the greatest happiness of all nations taken together” (Bentham 1838–43, 2:538). When the second edition of *IPML* appeared in 1823, Bentham’s preferred usage was “the greatest happiness principle,” having found the “utility principle” and “the greatest happiness of the greatest number” phrases subject to interpretations at odds with the original intent of the theory (although he continued to use both phrases on occasion). When he turned his hand to relating the history of the utility principle in the “Article on Utilitarianism” (1829), he alluded to misinterpretations of the principle and discussed the problem of the potential exclusion of minority interests under the phrase “the greatest happiness of the greatest number,” an outcome he deemed inconsistent with the maxim that each person’s interests must be counted in calculations of general utility.

Bentham’s analysis of penal law, his own theory of punishment, and its architectural adjunct, the Panopticon, have left a lasting impression on the crafting of penal law on both sides of the Atlantic. As Bentham wrote, in all cases of calculating the quantity of punishment, it must be considered that punishment “is in itself an expense: it is in itself an evil.” It adds to the

stockpile of pain in the community, and this should always be avoided when a greater good is not served by its application. This calculation determines which acts the law should seek to deter. Where deterrence failed, punishment was applied. Utility in penal law also encompassed three secondary ends: reformation, disablement, and compensation (Bentham [1780] 1970, 180). The quantity and quality of punishment attached to the violation of a particular law should be calculated to serve the primary end of example or deterrence, but should also include these secondary ends when feasible.

Bentham's writings on civil (or distributive) law were first given circulation in Dumont's *Traité*s. The essence of his civil-law position is the argument that outside the area of criminal activity, "the care of [one's] enjoyments ought to be left almost entirely to the individual" and that "the principal function of government is to guard against pains." From this perspective, the way for governments to protect individuals is to create and confer rights, such as the "rights of personal security, rights of protection for honour, rights of property, rights of receiving aid in case of need." Infringements of these rights should be regarded as offences punishable by law. To this basic utilitarian structure of the civil law, Bentham added the "subordinate ends" of utility—security, subsistence, abundance, and equality, in this order of priority—intended as a guide to the legislator in the development of policy and law. "The more perfect enjoyment is in all these respects, the greater is the sum of social happiness: and especially of that happiness which depends upon the laws" (Dumont [1840] 2004, 95–96)

At the root of Bentham's understanding of security as the principal object of law is the security of expectation—the guarantee against future loss, which enables individuals to confidently plan for the future in their labor and contractual arrangements, knowing that they will not be disappointed in their legitimate expectations. Based on the assumption that in nearly every instance individuals are the best judge of their own interests, the legislator must remove whatever obstacles stand in the way of individuals securely pursuing and fulfilling their expectations. Here we can locate the emergence of indirect utilitarian theory, an approach further developed by Mill, and also see the first development of what Bentham later termed the *disappointment-preventing principle*, intended as a practical strategy to be

followed by the legislator when the effect of new legislation would otherwise be to thwart an individual's legitimate expectations. Where possible, the pain of disappointment must be avoided, but where it cannot be avoided, it must be adequately compensated. This provision was meant as a safeguard against wide-ranging and ill-conceived plans to redistribute property, such as occurred in France following the 1789 Revolution. However, it was not a bulwark against all reform in the distribution of property. Slavery should be abolished, Bentham thought, but not in a manner that might reduce to poverty those legally involved in the slave trade; compensation from public funds would make up for the disappointed expectations of legal slave traders.

Bentham's theory of civil law provided him with the essential framework for addressing economic issues, but his approach also benefited from the influence of Adam Smith. In *Defence of Usury* (1787), his first essay in political economy, Bentham professed himself a disciple, albeit one who was critical of the restrictive lending laws supported by Smith. In subsequent economic writings, Bentham continued to adhere to the laissez-faire principle, but at times with modifications dictated by general utility. Facilitating individuals in the pursuit of their interests in a free market is what government should do because this is the proven best way to maximize general happiness. Where laissez-faire does not produce the best result, the legislator can act in other direct and indirect ways to produce the optimal outcome, consistent with the security-providing principle and with the disappointment-preventing principle. The question, as Bentham put it in *Manual of Political Economy*, "is to know what ought and what ought not to be done by government. It is in this view, and in this view only, that the knowledge of what is done and takes place without the interference of government can be of any practical use" (Stark 1952–54, 1: 224). Based on past experience, he thought governments should not act in the economic realm as much as they generally do, hence the motto "Be quiet" and the lists of nonagenda items. Where departures from this general rule are required—such as when vital subsistence goods would be priced beyond the reach of many in times of emergency—they become agenda items for government (Stark 1952–54, 3:33). This stance points to a political economy in which laissez-faire holds general sway, the basic rules of which are maintained by

government, with occasional exceptions justified on the grounds of utility (or its subordinate ends).

Influence

Bentham's utilitarian ideas had a substantial influence on later developments in the areas of political thought, legal theory, and moral philosophy. In political and constitutional thought, his ideas were advanced in nineteenth-century Britain by the philosophic radicals, including James and John Stuart Mill, Francis Place, George Grote, Edwin Chadwick, Arthur Roebuck, Joseph Parkes, Albany Fonblanque, and Charles Buller. Outside Britain, the various editions and translations of his writings introduced his ideas into the political discourse of North and South America, France, Portugal, Spain, Greece, Russia, and elsewhere, occasionally incurring the ire of national governments and being banned by local censors. Historians of law and legal philosophy cite John Austin as the most influential early disciple of Bentham's jurisprudence. Though Austin followed Bentham in developing a rational and utilitarian approach to law, his stress on the theological elements of his philosophy in *The Province of Jurisprudence Determined* (1832) owed more to his reading of William Paley's religious utilitarianism than to Bentham's secular version of the theory. It was largely through the sympathetic criticism of John Stuart Mill that Victorian moralists became acquainted with Bentham's philosophy. Partly in response to T. B. Macaulay's criticism of James Mill's explanation of the political ramifications of utilitarianism in an *Essay on Government* (1820), and partly as the result of his own reflections on his intellectual inheritance, John Stuart Mill developed an amended version of utilitarian theory. His revisionism took concrete form in the essay "Bentham" (1838), is reflected in *On Liberty* (1859), and received definitive expression in *Utilitarianism* (1861). In the last, Mill sought to defend the basic Benthamite hedonism of utilitarian theory, while offering refinements designed as responses to critics of the doctrine. The most problematic of these is the distinction between the qualitative differences of types of pleasures, which tended to undermine the aggregative dimension of the theory by merging uncertainly with theories of virtue and rights.

The influence of Bentham's legal theory has chiefly been felt in legal positivism, which came to dominate the philosophy of law in Western societies in the nineteenth and twentieth centuries. With its stress on the division between morality and law, and the subordination of the former to the will of the sovereign, legal positivism was derived by Bentham and Austin from utilitarian principles, but also owed a good deal to Hobbes's command theory of law. Identifying law in empirical or descriptive terms—the location of political sovereignty, the particular commands or laws of the sovereign, and the sanctions employed to deter and punish those who disobey—is the first step in the critical evaluation of law. Only then can the legal theorist move on to consider what the law ought to be; it is from the standpoint of utilitarian morality that existing law should be judged. In certain respects, Austin's utilitarian legal theory had a greater impact than Bentham's on Victorian legal philosophy, for three reasons: (1) it retained the idea of God as the ultimate legislator, (2) it was less critical of common law, and (3) Austin's critique posed less of a threat to the legal profession than the more radical approach of Bentham. In particular, Austin's work was substantially better received in America, where Bentham was commonly perceived as a godless atheist with a wholly materialist and mechanistic view of human nature.

Bentham remains influential in a wide range of contemporary fields of study, including linguistics, psychology, penology, administrative theory, economics, and education, as well as ethics, jurisprudence, democratic theory, and legal philosophy. His critical analyses of laws prohibiting homosexuality, his defense of animal rights and the rights of women, and his general theory of punishment are among aspects of his writings still read with interest, and philosophers continue to debate the merits and shortcomings of the utility principle as the appropriate test of morality.

Bergson, Henri

Henri-Louis Bergson (1859–1941) was a French philosopher best known for his work on time, memory, and evolution and for his use of intuition in philosophical method. The attention he pays throughout his work to the processual nature of reality—to states of becoming rather than being—associates him with process philosophy. Due to his insistence on the inherent creative tendencies in biological life, he is often considered a vitalist, though he differs from proponents of other traditions of vitalism in maintaining a nonteleological view of evolution. An ethical dimension can be traced across his central ontological, psychological, and biological concerns, and several authors have developed the social and political implications of his philosophy. Political thinkers influenced by Bergson include Charles Péguy, Georges Sorel, and Antonio Gramsci. In his last major work, *The Two Sources of Morality and Religion*, Bergson directly addressed such topics as the evolution of societies, the nature of religion, and the genealogy of political modernity.

Prewar Life and Career

Bergson was born in Paris on October 18th, 1859, to Michael Bergson, a Polish musician, and Kate Levinson, from Doncaster, England. In 1869, when the family moved to London, the ten-year-old Bergson remained in Paris to continue his education, having been awarded a bursary by the French government. During his secondary school years, he continued to

excel, particularly in mathematics, yet eventually opted to study philosophy at the École Normale Supérieure, where his fellow students included Émile Durkheim and Jean Jaurès. After graduating, he taught at several schools (*lycées*) while preparing his doctoral theses. The longer of these, *Time and Free Will* [*Essai sur les données immédiates de la conscience*] (1889) constitutes his first major work.

In 1892, Bergson married Louise Neuberger (a relative of Marcel Proust). Their daughter, Jeanne Bergson, was born deaf in 1896. Later the same year, he published his second book, *Matter and Memory* [*Matière et Mémoire*] and soon after became *maître de conférences* (equivalent of Associate Professor) at the École Normale Supérieure. In 1900, he was appointed to the Chair in Greek and Latin Philosophy at the Collège de France, transferring to the Chair in Modern Philosophy in 1904 following the death of its previous occupant, Gabriel Tarde. In 1901, he was elected a member of the *Académie des sciences morales et politiques*. Significant publications from around this time include *Laughter: An Essay on the Meaning of the Comic* [*Le Rire*] ([1900] 2005) and *Introduction to Metaphysics* ([1903] 1912).

At the Collège de France, Bergson's lectures, which continued from his appointment until 1914, were so popular with both students and the wider public that it was suggested that they be moved to a theater. The already widespread interest in his work was further augmented in 1907 (1911) with the publication of *Creative Evolution* [*L'Évolution Créatrice*], which attracted much admiration as well as criticism. An English translation of *Time and Free Will* was published in 1910, with translations of *Matter and Memory* and *Creative Evolution* following in 1911. In the same year, Bergson gave several lectures in Britain, at the Universities of Oxford, Birmingham, and London, where he established good relations with, among others, Arthur Balfour (former British prime minister and future wartime secretary of state). In 1913, he made a lecture tour of the United States organized by Columbia University (where his first lecture was so popular that it reputedly caused one of the first traffic jams on Broadway). In 1914, he gave the Gifford lectures at the University of Edinburgh.

Political Activity and Later Life

As for most Europeans, the outbreak of World War I constituted a major turning point in Bergson's life. From this time, his energy was increasingly diverted away from philosophical research toward public political activity. He wrote articles and gave talks in support of the Allied war effort, including "The Meaning of the War" (1914) and "The Evolution of German Imperialism" (1915). In 1916, he travelled with other French academics to Madrid to encourage Spain to support the Allies. His most significant political activity during the war—both in terms of his own life and his influence on international politics—was the set of missions he undertook in the United States on behalf of the French government.

The French Prime Minister Aristide Briand called on Bergson to make an unofficial visit to the United States and make personal contact with President Woodrow Wilson to negotiate U.S. financial and military support for the Allies. Wilson had made such support contingent on the Allies' agreeing to the creation of a League of Nations, but was not yet convinced of the commitment of the French government, partly due to its refusal to countenance the entry of Germany to such an organization prior to its defeat and the imposition of reparations. According to Bergson's biographer Philippe Soulez (1989), his interventions were decisive in convincing Wilson of both the French commitment to the League of Nations and the importance of the U.S. not only providing financial resources, but also adding its full military force to the struggle against the Axis powers.

Following the war, Bergson sought to retreat from public life and return his attention fully to his philosophical work. This return was interrupted, however, by his nomination in 1922 to the International Committee on Intellectual Cooperation, an advisory group for the League of Nations, whose other members included Paul Valéry, Thomas Mann, and Albert Einstein. Bergson's interpretation of Einstein's theory of relativity was published in 1922 (1965) as *Duration and Simultaneity*, leading to a controversial series of intellectual confrontations between them.

In 1925, ill health forced Bergson to retire from his public duties. On being awarded the 1927 Nobel Prize for Literature, he was unable to travel to Stockholm for the ceremony. He was nevertheless able to complete his most sociological and ethical work, *The Two Sources of Morality and Religion*

[Les deux sources de la morale et de la religion] (1932), and publish a final collection of essays, *The Creative Mind [La Pensée et le mouvant]* (1933). Following the outbreak of World War II and the Nazi invasion of France, Bergson refused an offer of exemption from anti-Semitic treatment under the Vichy regime. Instead, despite a declared affinity with Catholicism, he registered as a Jew. He died shortly after of pulmonary congestion, on January 3rd, 1941.

Three Major Works

Despite not engaging explicitly with social or political questions, Bergson's influential texts on time, memory, and evolution all have potentially wideranging social implications. Most of his major contributions to modern thought can be traced back to his analysis of a single problem: that of the spatialization of time, or more specifically, the confusion of duration with extensity.

For Bergson, the way we most commonly and immediately treat time in our everyday lives actually translates it into something more like space: the abstract, homogeneous medium of Newtonian physics, which is also implied in the time we measure and record with clocks, calendars, and timetables, treats instants as though they were points in space, and reduces time to the distance between them. Rendering time measurable, being able to compare different processes of change and movement, is so important to human activity, from planning and organizing in everyday life to carrying out scientific experiments, that this spatialized conception of time comes to be taken for granted: it is one of the "immediate givens of consciousness" referred to in the French title of *Time and Free Will*.

The critical aspect of Bergson's philosophy consists in asking us to give up this habit of thinking of time in terms of extension. A correlative gesture is the call to recognize the experience of a nonspatialized temporality, which he terms *duration (la durée)*. Duration can be accessed directly only through an act of intuition whereby we "insert ourselves" in duration. Where spatialized time implies an abstract medium in which things move, duration refers to "pure movement," continuous growth. Pure movement does not mean conceiving of movement as independent of matter: it is,

rather, a question of reversing the habitual direction of thought, such that, instead of taking the existence of objects in space for granted, and from this perspective considering their motion, we rather begin with the fact or experience of movement and consider secondarily that which moves.

A further key thesis of Bergson's philosophy is that duration—or reality itself—is creative in that every moment is radically new and qualitatively different from the last—even in (in fact because of) its continuity with those before and after. Thus, where clock time is extensive, quantitative, and homogeneous, duration is intensive, qualitative, and heterogeneous. Clock time implies predictability; duration implies inventiveness and radical change. These two tendencies—one creative and indeterminate, the other mechanizing—are found in all Bergson's major works. In *Time and Free Will*, he argues that our reduction of time to the status of a homogeneous spatial medium obscures the creative aspect of reality, making it seem as though everything in the universe were governed by deterministic laws—thus constructing a defense of freedom at the metaphysical and a psychological levels while also accounting for the efficacy of the quantitative understanding of time in both science and everyday life.

In *Matter and Memory*, it becomes clear that Bergson's central dualism between creative and deterministic tendencies is not simply one of false appearance (spatialized time-mechanism) versus underlying truth (duration-creativity); rather, they are two tendencies that in their very opposition to one another together constitute reality. On this basis, he argues for the immanent reality of both spirit and matter, moving beyond traditional philosophical disputes that treat idealism (the view that reality is in some sense a projection or construct of the mind) and realism (viewing the world as existing independently of mind) as mutually exclusive. This treatment also allows him to argue, contrary to contemporaneous scientific research, that the brain may be the instrument of recall without necessarily operating as a physical repository for memories.

In *Creative Evolution*, the two tendencies are found in biological life: on the one hand, a creative force (the *élan vital*) that is responsible for the ongoing, open-ended development of life in divergent directions; on the other hand, the restrictive effects of the matter in which this creative

evolution must be realized. Once again, the critical aspect of Bergson's argument is based on an analysis of our tendency to reduce real time or movement (here in the form of the process of evolution) to a series of points along a scale (this time represented by the set of evolved species). As with his accounts of time and memory, this analysis leaves us with a flawed understanding of evolution and life as mechanical and determinate. While material constraints do have a mechanizing effect on the products of evolution, it is the very nature of the *élan vital* to resist this tendency in its ongoing creative development.

Philosophy of Society

It is perhaps unsurprising that a philosophy centered on a rigorous defense of freedom, creativity, and change, and which incorporated critical accounts of the limitations of scientific and intellectual thinking, should have appealed to those concerned with social and political reform. Before World War I, a number of contemporaries, such as Péguy and Sorel, perceived the sociopolitical potential of Bergson's philosophy and urged him to turn his attention more firmly in the direction of politics and social movements.

Sorel published five articles on Bergson in the journal *Mouvement socialiste* and along with Edouard Berth, promoted the project of bringing together the thought of Bergson and Karl Marx. Bergson himself was sympathetic to these calls, as he was to Albert Adès's request in 1918 that he dedicate a series of seminars to reframing his earlier work in more practically political terms. Yet despite an interest in political economy and the study of society demonstrated in his lycée teaching and in the social significance he attributed to laughter in his short book on the subject, it was not until his final work, appearing twenty-five years after *Creative Evolution*, that he directly addressed social and political questions in detail.

Bergson's final major work, *The Two Sources of Morality and Religion*, comprises a genealogical and philosophical enquiry into the nature of society, an account of the sociocultural role and origins of religion and morality, a socioevolutionary theory of fiction, and a diagnosis of the problems of the modern political era. Here the creative and mechanizing tendencies that *Creative Evolution* accounted for in biological life (and that

can be traced all the way back to the distinction between duration and extensity of Bergson's early work) are addressed in terms of human society and culture, where they constitute the two sources of divergent forms of society: morality and religion. At the same time, this retrospectively makes clear the ethical, social, and political significance of the opposition between duration and extensity (or creativity and mechanization) explored in the metaphysical, psychological, and biological registers of his previous works.

In *Two Sources*, not only intelligence, but also sociality are treated as evolved human traits that are beneficial for survival and carry certain drawbacks. Though, following *Creative Evolution*, these traits are the product of the creative tendency in biological life, it is the mechanizing tendency that most easily takes the dominant role in organizing human society.

Intelligence poses a threat to societies in the form of individualism. The role of morality is to keep such threats in check by operating as a form of social pressure to ensure that each member of the group adheres to its laws, customs, and norms. However, for Bergson, morality in the form of pressure is the product of the tendency in life toward stasis or closure. He refers to it as "closed morality" and to the society it helps preserve as a "closed society." However, since the respect and responsibility members owe one another within the closed society do not extend to those outside its walls (real or symbolic), the threat of individualism reemerges at the intersocial level, with whole communities endangering one another.

Hence, in contrast to the closed society, Bergson conceives of an alternative social form that would derive from life's creative tendency—the open society made possible by open morality. The latter would be based on aspiration rather than on pressure, and an expression of the unbounded creativity of living evolution would constitute the basis for a society with neither restrictions on membership nor implicit sanctioning of destruction of life—a kind of ethical cosmopolitanism with biological roots.

Though Bergson recognized that there are huge obstacles to achieving the open society, he also argued that, in the modern era, when the mechanizing tendency toward the closed society is supplemented by the destructive power of mechanized warfare, such that entire national populations face the

threat of extinction, it is more urgent than ever for humanity to try to make the immense effort required.

In the course of his discussion of the ethical movement from the closed to the open, Bergson pays close attention to the role of religion, distinguishing the static religion of the closed society from the dynamic religion associated with those mystic figures that exhibit a boundless and unconditional love toward others (Christ being archetypal). A particularly striking aspect of Bergson's account is his theory of fabulation in which he attributes an evolutionary and social function to the human capacity to construct and believe in the fictional (this being one of the conditions making religious belief possible in the first place).

The emphasis he placed on the figure of the true mystic seems to be one reason for the relative neglect of this text among Bergson's works (along with its late appearance). Hence, its potential value for the philosophy of society, political theory, the sociology of religion, and indeed, the social and political study of fictionalizing more widely, has only recently begun to be considered.

Berlin, Isaiah

Isaiah Berlin (1909–97) was a British political theorist, historian of ideas, and philosopher who is widely regarded as one of the foremost liberal political thinkers of the twentieth century.

Berlin's early thought is influenced by issues central to the analytical philosophy that was predominant in Oxford during the 1930s and 1940s. Although Berlin came to break away from a direct engagement with this form of analytical philosophy, it influenced his subsequent work through an underlying empiricism and skepticism toward systematic metaphysical theorizing. From the early 1950s, the focus of Berlin's work shifted from the debates of analytical philosophy toward the issues of political and social theory and the history of ideas. Berlin argued in favor of the continuing relevance of moral and political thought against a prevailing academic background that was largely dismissive of the claims of normative theory. The case for this position is presented most notably in the essays "Does Political

Theory Still Exist?" (1962) and "The Purpose of Philosophy" (1962). In a similar vein, writings such as "Historical Inevitability" (1954) and "The Concept of Scientific History" (1960) argued against scientific and determinist interpretations of historical development that were espoused by many of his contemporaries.

The writings in the history of ideas that Berlin set upon in earnest from the early 1950s onward are primarily concerned with exploring the role of ethical monism in the tradition of political thought. For Berlin, monism constitutes the dominant, though mistaken, belief that all genuine values are ultimately harmonious. According to Berlin, this belief is central to the philosophy of the Enlightenment, and his studies of various Counter-Enlightenment figures such as Giambattista Vico, Johann Gottfried Herder, Johann Georg Hamann, and Montesquieu constitute an investigation into the work of thinkers who challenged this perspective.

The 1958 lecture “Two Concepts of Liberty” represents the most complete single expression of the main themes of Berlin’s political theory. Through an exploration of the history of social and political thought Berlin presents a case for the adoption of liberal ideals against those of political authoritarianism. The central thesis of the piece revolves around a conceptual distinction Berlin posits between the competing notions of negative and positive liberty. In short, ideas of negative liberty view freedom as a sphere of individual life that is sacrosanct and protected from infringement by others, whether persons or governments. In contrast, positive ideas of freedom emphasize the value of liberty as a condition of fulfilling human potentiality, and thus, it is a freedom to an end goal. Berlin argued that while both concepts of freedom are valid in their own right, the positive form is more prone to become confused with other values, such as justice and equality, which are in fact separate and distinct ideals. Moreover, positive liberty has historically proven itself more conducive to the establishment of political tyranny. In making this case, Berlin argued that a degree of culpability should be attributed to past political thinkers for justifying authoritarianism in the name of liberty.

In support of the case for a defense of negative freedom and liberal policies in general, Berlin makes recourse to what has subsequently been recognized by most commentators as the key theme of his political thought: the existence of a pluralism of values or value-pluralism. According to Berlin, ethical life is composed of a multitude of values for which there is no fixed or inevitable hierarchical ordering of importance. Indeed, many values and ideals are not only incompatible, but also incommensurable, meaning that some degree of conflict and loss between values is unavoidable. To assume

that conflicting values can be harmonized is a fallacy, and to seek to mold human life to meet a fixed structure of ethical goods is to invite political authoritarianism and coercion. Therefore, liberalism with its protection of a sphere of negative freedom is both the most humane form of political organization, as well as the one that most accurately reflects the nature of human ethical experience.

Some subsequent thinkers have challenged the connection Berlin drew between liberalism and the existence of a pluralism of values. For example, John Gray in his *Isaiah Berlin* (1995) has argued that value-pluralism undermines efforts to imbue the ideals of liberalism with any universal applicability, and therefore, it can only be viewed as one form of political life alongside many others that may well reject its guiding ideals. It is this idea of value plurality and its consequences for political theory that has constituted the main theme of Berlin's intellectual legacy.

Bernstein, Eduard

Eduard Bernstein was a leading German Social Democratic politician and theorist. His life is a microcosmic reflection of the first century of the German Social Democratic Party (SPD). Like the German labor movement itself, Bernstein started out as a socialist eclectic; then he converted to Marxist orthodoxy only to return to an eclectic position that, enriched by Marxist theory, nonetheless espoused a democratic socialism that recognized Marxism as only one among several important theoretical sources. The core of Bernstein's views is not the proletarian revolution and the prospect of the general abolition of private property, but an ethical commitment to representative democracy, social justice, and equality.

Born in Berlin on January 6, 1850, Bernstein grew up in modest circumstances. After a short career as a bank clerk in Berlin, he joined the SPD as a campaign speaker and pamphleteer. Expelled from Germany in 1878 as a result of German Chancellor Otto von Bismarck's repressive Anti-Socialist Laws, Bernstein settled in Zurich, Switzerland, from where he edited *Der Sozialdemokrat*, the rallying point of the underground SPD press. When Bismarck secured his expulsion from Switzerland, Bernstein continued publication of the periodical from London, where he cultivated close contacts to Friedrich Engels and the leaders of the socialist Fabian Society such as Sidney and Beatrice Webb and George Bernard Shaw. When Engels died in 1895, Bernstein served as his literary executor and was widely regarded as one of the leading Marxist voices in Europe.

Thus, it came as a shock to his party comrades when Bernstein launched a series of tough criticisms against Marxist theory. In a number of articles and books that appeared between 1896 and 1900, the former Marxist stalwart rejected the central Marxist dogma of the inevitable collapse of capitalist society and the ensuing revolutionary seizure of power by the working class. In his view, Marx and Engels had painted an unrealistic picture of a revolutionary final goal. Suggesting that capitalism was getting better at containing its weaknesses, Bernstein advocated an evolutionary road to socialism through peaceful, parliamentary means centered on success at the ballot box and gradual democratic reforms. Stressing the tight connection between means and ends, he insisted that the extension of democracy required democratic methods. Moreover, he argued that the SPD ought to broaden its narrow working-class base and appeal to the middle class as well, thus turning itself into a genuine people's party. Finally, rejecting the Marxist view that liberalism and socialism constituted diametrically opposed worldviews, Bernstein urged socialists to consider themselves "the legitimate heirs of liberalism" and embrace the Enlightenment language of citizenship, human rights, rule of law, and universal ethics.

Although Bernstein's views on Democratic Socialism became the widely accepted cornerstones of modern European social democracy after World War II, they were severely condemned at three successive SPD congresses at the turn of the century. Various European Marxists such as Vladimir Illyich Lenin in Russia and Rosa Luxemburg and Karl Kautsky in Germany wrote vitriolic pamphlets calling Bernstein a "muddle-headed revisionist" betraying the cause of the working class. At the outbreak of World War I in 1914, Bernstein first voted with the entire SPD leadership in favor of the war, but reversed his opinion a year later, arguing that the German Imperial Government had been the aggressor. When the Bolsheviks seized power in Russia in 1917, Bernstein emerged as one of their earliest and fiercest critics, warning that Lenin's brand of Soviet communism was based on the "erroneous belief in the omnipotence of brute force." He predicted, correctly as it turned out, that the Soviet regime represented an "odd repetition of the old despotism of the Czars" that would lead Russia into a "social and economic abyss." In the short-lived German Weimar Republic (1918–33), the aging Bernstein held high political posts, including the cabinet position of undersecretary of the treasury. During his parliamentary

tenure from 1920 to 1928, he concentrated on matters of taxation and foreign affairs while maintaining his busy journalistic schedule. Bernstein died on December 18, 1932, only six weeks before Adolf Hitler took power in Germany.

Black Power

Although several scholars have suggested that the ideological framework and practical applications for African American leadership based upon promotion of insular community interests and control of community institutions—Black Power—had their origins in the period of antebellum slavery and others contend that the modern use of the phrase originated with congressman Adam Clayton Powell in the 1950s, there is a general consensus that contemporary Black Power resulted from the Meredith march of 1966.

The Meredith March of 1966

In early June 1966, James Meredith, the first known black student to enroll at the University of Mississippi, began a proposed 200-mile walk from Memphis, Tennessee, to Jackson, Mississippi, to inspire Mississippi blacks to vote. Despite the passage of the Voting Rights Act of 1965, many Southern blacks, particularly in such areas as rural Mississippi, still were afraid to register and cast their votes. Meredith's proposed march was to be a demonstration against fear. The Meredith march had barely begun when, on June 6, he was struck, but not seriously wounded, by a shotgun blast. The first news reports did not clearly describe Meredith's condition, and many blacks assumed that he was mortally wounded, another civil rights advocate felled by an assassin's bullet. Civil rights leaders from throughout the nation denounced what was feared to be a slaying and vowed to carry

on where their fallen comrade had left off. Several of these, including Martin Luther King Jr., of the Southern Christian Leadership Conference (SCLC), Stokely Carmichael of the Student Nonviolent Coordinating Committee (SNCC), and Floyd McKissick of the Congress of Racial Equality (CORE), sped to Memphis to continue the March Against Fear.

As the new marchers, black and white, gathered on U.S. Highway 51, undercurrents of disunity surfaced. At least since 1963, younger elements in the Civil Rights Movement had begun to question two major tenets of the leadership of Martin Luther King Jr.—nonviolence and white participation. During the Meredith march, leaders of CORE and more particularly of SNCC, questioned the presence of whites in the Mississippi protests. As violence against the demonstrators continued, and as Mississippi law enforcement officers arrested some of them, the tenets of King fell into further disfavor with the Meredith marchers. Among the Young Turks who dared to challenge openly the leadership of King, the most articulate was the SNCC's Carmichael. After emerging from a Mississippi jail, the fiery, West Indian-born youth told a crowd of blacks that he was not going to jail again and that every courthouse in Mississippi "ought to be burned down to get rid of the dirt." Then Carmichael shouted a phrase previously used by SNCC's Willie Ricks and others, "Black Power." "Black Power," the younger blacks responded. "Black Power," Carmichael roared four additional times. "Black Power," the young blacks replied each time. When Martin Luther King Jr. heard the chanting of the slogan, he expressed disapproval. His closest followers urged the slogan "Freedom Now" upon the marchers. But Martin Luther King Jr. was not in control of the Meredith march; Carmichael was. And his cry was "Black Power."

Defining Black Power

What did it all mean? The media, white politicians, black leaders, almost everyone, reacted with a definition. Many saw it as an ill omen. It was, in their view, a verbal justification of the black violence of the Harlem and Watts riots of the previous two years. It was black racism, black retaliation for the long years of white oppression. It was rage, ungodly, un-American.

It was almost a year after the Meredith march that Carmichael collaborated with political scientist Charles Hamilton to articulate a definition of Black Power. They saw the concept principally in political terms. Accepting the reality of two American societies, one white and one black, they argued that the black community must be developed, reconstructed, and controlled in the interest of blacks. Separate black political organizations should run and elect black candidates in black communities. The institutions of black America, particularly the economic and educational ones, should be responsive to black people. Only by organization and control of their own communities, they argued, could blacks ever expect to achieve social and political integration into the mainstream of American society. A powerful black political base and powerful black-controlled social and economic institutions, Carmichael and Hamilton seemed to say, would win respect and acceptance from white America and achieve black liberation.

After Carmichael and Hamilton gave their philosophical position on the questions and issues surrounding the controversial slogan “Black Power,” politicians, journalists, civil rights leaders, scholars, and even schoolchildren continued to debate the meaning of the now famous slogan.

When scholars in the civil rights era began to assess the concept of Black Power, many, such as Harold Cruse and Martin Duberman, agreed with Carmichael and Hamilton that political control of organizations and institutions in the black community are at the core of the concept, but the further ramifications have led to a myriad of positions. Some, such as Maulana Karenga and Alvin Poussaint, characterized it as a positive, creative concept that bolstered black self-esteem. Others, including Adelaide Cromwell Hill and Lawrence Neal, connected it to black nationalism, including a nationalistic black religion and Pan-Africanism. Still others, led by Komozi Woodard, found a cultural dimension in it as expressed, for example, in the relationship between the Black Arts movement and black politics. Some, including Harold Cruse and Nathan Wright, suggested that politically, Black Power had resulted from the failure of the Civil Rights Movement.

As the scholars opined on the question of Black Power, black activists of various persuasions debated the issue in the media, in public forums, and

often behind closed doors. Robert F. Williams of North Carolina, for example, an advocate of black self-defense, identified black progress and Black Power with “violence and upheaval.” The black nationalist Karenga de-emphasized the economic and political aspects of Black Power and extolled the virtues of “color culture and consciousness.” Money, he said, was not the answer to the problem. He called on African Americans “to Think Black, Talk Black, Act Black, Create Black” and “Live Black,” which were as important to him as buying and voting black.

One of the first of the older black leaders to embrace the concept of Black Power was McKissick, then head of CORE. CORE, like the National Association for the Advancement of Colored People (NAACP), had been founded as a biracial group dedicated to racial integration and equality, but during and after the Meredith march, McKissick pulled the organization away from a dominant white influence and into Black Power. Yet McKissick seemed to have had some early difficulties in defining it. After considerable criticism from white supporters of CORE, McKissick declared in July, 1966 that “Black Power is not Black supremacy,” and it did not mean the exclusion of white Americans from the black revolution, did not advocate violence, and would not lead to riots. Sometime later, he said the Black Power movement attempted to “achieve power for Black People” in six different areas: political, economical, improved self-image, development of leadership, federal law enforcement, and consumer mobilization.

Malcolm X, the most articulate philosopher of the Nation of Islam, like some scholars, saw the American black struggle in international terms. During and after his heralded pilgrimage in 1964, Malcolm continuously advocated a link between the problems of Africans and Asians and that of African Americans and that the black problem in the United States should be argued on the floor of the United Nations. Although Malcolm was assassinated prior to the rise of the new cry of Black Power, his previous positions would have placed him in the camp of its advocates.

Another nontraditional African American religious leader, Albert Cleage, founder of the Black Christian Nationalist Church (The Church of the Black Madonna), believed that blacks did not understand institutionalized power. He called the so-called Black Revolution in the 1960s and 1970s

unstructured. Black Power, he felt, could be attained through the church, but only if it was relevant and able to structure black institutions and spearhead a black revolution. He believed that such a church could be found through black Christian nationalism.

The man who is often credited with originating the Black Power slogan, Adam Clayton Powell Jr., discussed the matter in the U.S. House of Representatives during the Eighty-Ninth Congress. Powell said, on that occasion, “Black people must seek audacious power—the kind of power which cradles your head amongst the stars and gives you the security to stand up as proud men and women, eyeball to eyeball with the rest of the world” (Cong. Rec. 12438–12439 (1966)). He described his own position as Chairman of the House Committee on Education and Labor, in which he controlled all labor and education legislation, as an example of “audacious power.” Powell, understandably, saw Black Power principally in political terms: black control of black organizations and institutions.

While McKissick, the head of CORE, placed his organization in the Black Power camp with SNCC, the heads of the three other major civil rights organizations, SCLC, the NAACP, and the Urban League, initially sought strenuously to disassociate themselves from the Black Power concept and movement. From the beginning, King, head of the SCLC and the most revered of America’s civil rights leaders, had to confront the issue. He was in the original Meredith march and witnessed the transformation of ideas among the Young Turks of the Civil Rights Movement. In Mississippi, King urged Carmichael and McKissick to abandon the Black Power slogan. He told them that he was concerned about the suggestive sense of the phrase and that civil rights leaders must “work to build racial pride and refute the notion that black is evil and ugly” and that “this must come through a program, not merely through a slogan.” Carmichael, now clearly in control of the Meredith march, again challenged the preeminence of King’s philosophy and told the SCLC leader that he must take a public stand for Black Power. King, always conscious of the need for unity in the Civil Rights Movement, tried hard to prevent the Black Power slogan from tearing the Civil Rights Movement asunder. While he would not embrace the concept, he insisted that it did not pose the dangers that many saw in it. It was only a problem of semantics. Carmichael, McKissick, the Young

Turks, all of the exponents of Black Power were still united with him, King claimed, in the greater goal of black liberation through nonviolent resistance. Many of the theoreticians of Black Power found considerable comfort in the Harlem, Watts, Detroit, and other mid-1960s riots. By 1967, in partial recognition of this fact, King escalated his opposition to the concept of Black Power. It was, he said, an understandable reaction to racial discrimination and oppression, but it was unprogrammatic and hence could not achieve the goals sought by the Civil Rights Movement. It was, in fact, “nihilist” and carried the “seeds of its own doom.”

Roy Wilkins of the NAACP was much more uncompromising than King in his opposition to Black Power. Although it may be clarified again and again, he said in an NAACP memo on August 4, 1966, “‘Black power’ in the quick, uncritical and highly emotional adoption it has received from some segments of a beleaguered people can mean in the end only black death.” The NAACP would have nothing to do with the concept and apparently as little as possible to do with its advocates. Yet as Yohuru Williams (2000) reminds us, Wilkins was one of the few members of the civil rights establishment to break ranks and defend the Black Panther Party after he concluded in the early 1970s that unconstitutional and illegal methods were being used to systematically destroy the Black Panthers.

The Urban League’s Whitney Young, like King, sought not to inflame the Black Power issue. Young’s organization, heavily supported by white businessmen, reaffirmed its commitment to its traditional ideals and programs in August 1966. Young said that he would shun involvement in what he saw as a pointless dispute over the value of a slogan that even its originators had not clearly defined.

In the final analysis, the success or failure of Black Power seemingly depends not so much on the views of the scholars and the activists, but on the conception and the reality of the term in so far as the masses of black Americans were concerned. How would they interpret the concept, and would they abandon their traditional loyalties and strategies to embrace it?

Until the civil rights era, only a few systematic opinion polls were conducted among the rank and file of the black population. Too often the views of black spokesmen or black leaders were taken as representative of

the entire African American population in the United States. Like many other things, since the era of black disillusionment and black consciousness, the idea of a few spokesmen for blacks is rapidly waning. Consequently, there are polls and studies reflecting a much wider cross section of black opinion. One such study, concerning the meaning of Black Power, was conducted in Detroit in 1967. A random sample of 461 blacks was involved in the survey. In the question, "What do the words 'black power' mean to you?" 22.6 percent of the blacks said "Black Unity"; 22.3 percent said "Nothing"; 19.6 percent said a "Fair Share for Black People"; 8.5 percent said it meant the "Blacks Rule Whites"; 6.5 percent said "ridicule, obscenity, abhorrence"; 4.1 percent said "Trouble, Rioting, Civil Disorder"; 3.9 percent defined it as "Racism"; and 4.3 percent gave various other comments. The authors of the study, Joel Auerbach and Jack L. Walker (1970), concluded that the blacks were almost evenly divided in their interpretation of the controversial slogan. Roughly 42.2 percent of the blacks, they found, were "clearly favorable to black power," while 49.6 percent defined it "in an unfavorable way." Those blacks who were favorable to Black Power saw it "as another call for a fair share for blacks or as a rallying cry for black unity," while those who were negatively inclined saw it as "empty and meaningless" or "nothing."

In the spring of 1975, this author conducted a similar but much smaller random survey among blacks in Atlanta, Georgia. The twenty respondents included a 65-year-old high school teacher, seven high school students, five college students, two internship program administrators, an attorney, a steel worker, a college professor, a cook, and a domestic worker. In the Atlanta survey, 80 percent of the blacks were clearly favorable to Black Power, while 20 percent defined it in an unfavorable way. Interestingly enough, three-fourths of those who viewed the concept negatively held lower-income jobs. Almost all of the students and professional people saw the concept in a positive vein. While the Atlanta blacks defined Black Power variously, the most common responses included the idea of black unity and the notions of economic self-sufficiency and political control of black communities and institutions.

During three months of the summer of 1966, Joyce Ladner, then a civil rights worker, conducted a study aimed "at finding out how Mississippi

Negroes who endorsed ‘black power’ interpreted this new concept.” She learned that “even those civil rights activists who welcomed the concept attached curiously different meanings to it.” Among her thirty respondents, Ladner found political control of black communities and institutions as the definition of Black Power. She further found that frustration, primarily with the course of the Civil Rights Movement, drew her respondents to Black Power.

New Scholarly Studies of Black Power

In the post-civil-rights era, probably in anticipation of the fortieth anniversary of the Meredith march in 2006, Matthew Countryman, Akinyele Umoja, Duchess Harris, Hasan Jeffries, Lance Hill, Adolph Reed, Jeffrey O. G. Ogbar, Kimberly Springer, Williams, and other scholars have revisited the concept of Black Power. Some have embraced earlier meanings, while others have offered fresh analyses. Some have expanded discussions of the integration of the Black Power movement with the Civil Rights Movement, the Pan-African aspects of Black Power, the role of gender and class in the movement, and the pivotal place of self-defense as exemplified by the NAACP’s Robert Williams in North Carolina, the Deacons for Defense in Louisiana, and the Black Panther Party. There has also been a renewed emphasis on Black Power activities in the North and Black Power’s role in African American culture as well as its multicultural impacts. The best synthesis of this New Black Power historiography is Peniel Joseph’s (2006) *The Black Power Movement: Rethinking the Civil Rights–Black Power Era*.

As to the theory and practice of Black Power, some of the more recent pronouncements of activists and the new Black Power historiography suggest that it has already been achieved. For others, the struggle to attain it still goes on. For some, its achievement is an impossibility.

Louis Blanc (1811–82) was the first known socialist in any country to hold a government post. The son of a legitimist French official who lost his pension after the 1830 revolution, Blanc secured a scholarship at the *collège* in Rodez. His direct, simple style and useful connections (his first job was tutor to the children of Frédéric Desgeorges, liberal notable and newspaper editor in the Pas-de-Calais) quickly allowed him to become a leading radical journalist. Writing first in 1834 for the *Bon Sens*, a weekly paper for workers, in 1839 he helped found *La Revue du progrès politique, social et littéraire*. In 1840, a selection of his articles became a book, *L'Organisation du travail*. Within two weeks, 3,000 copies were sold; the next printing did well, probably helped by a government confiscation order. Quoting statistical evidence of poverty published by Ange Guépin, Louis-René Villermé, and Eugène Buret, Blanc argued that free competition, much vaunted by liberal economists, was enslaving workers, especially women. The economy would be controlled eventually by a tiny minority of the most ruthless employers. His solution was worker cooperatives, not unlike those set up by Philippe Buchez and Pierre Leroux, but financed by the state, the “the banker of the poor” as Blanc put it. Once initial government loans had been repaid, the cooperatives would be autonomous. Victor Considérant and the Fourierists were advocating a similar concept, although Blanc did not acknowledge this. By 1848, five editions of Blanc’s book had appeared, each fatter as he refuted his critics who pointed out that social workshops would also be competitive and thus oppressive.

Blanc helped launch the powerful radical daily, *La Réforme*, which promoted both social and suffrage reform before 1848. He wrote a five volume influential critique of the Orleanist regime, *Histoire de dix ans* (1841–44), and published two books of his fifteen-volume pro-Robespierre history of the 1789 revolution. Unlike Étienne Cabet and the Fourierists, he did not try either to create a socialist movement around himself, or set up worker associations. Up to 1848, Blanc was a popularizer and synthesizer.

The February revolution in 1848 seemed to offer an opportunity to radicals and socialists to find solutions to the social question. Blanc joined the republican provisional government along with other journalists from *La Réforme* and *Le National*. As secretary of the Workers' and Employers' Luxembourg Commission, appointed by the government to advise on the economic crisis, Blanc persistently but vainly urged the ministers to adopt his notion of social workshops. They preferred traditional National Workshops, which provided little more than a tiny dole. Blanc's commission managed to arbitrate industrial disputes in the capital and organize a couple of workshops, one of which made the embroidery for national guard uniforms, but his radicalism worried his fellow republican ministers.

Like other radicals, Blanc was alarmed at the lack of a republican majority in the new Constituent Assembly, despite its being elected by direct universal male suffrage for the first time ever. Blanc participated in the workers' march to the Assembly on May 15, 1848, whose ostensible motive was to encourage government support for revolutions abroad, notably in Poland. The big issue, however, was the fate of the government's workshops, which by May had over 100,000 members and seemed to the conservative majority in the new Assembly both an ideological and a physical threat as well as a financial burden. After some delay, the Assembly decreed their closure. The resulting worker rebellion in June was somewhat unjustifiably blamed on Blanc, who had fled to London after the May fiasco. The divisions among radicals about the form of the new republic, plus the lack of majority support for a republic among voters, contributed to the election of Napoleon's nephew as president and the subsequent reinvention of an empire. Although Blanc had fused a number of socialist strands into his own pet projects, his intransigence and self-

conceit in the spring of 1848 helped to isolate him and divide radical reformers.

In enforced residence in London until 1870, Blanc might have been a uniting focus, but he spent his time constantly reiterating his own solutions and arguing with fellow socialists and republicans. Although more of his writing was translated into English than that of other French socialists, he does not seem to have established as much contact with English radicals and Owenites as did the Fourierists. He opposed the Commune of 1871 and was elected to the new National Assembly where he sat as an elder statesman. He was regarded as an inspiration for the radical socialist movement that emerged at the turn of the century. Probably the best-known socialist in his day, he has been the least remembered in recent years.

Blanqui, Louis-Auguste

Blanqui, Louis-Auguste

Blanqui, Louis-Auguste

Louis-Auguste Blanqui (1805–81) was a nineteenth-century French republican activist and a legendary revolutionary insurgent. He was born in Puget-Théniers in southern France, the son of a minor official in Napoleon's government. To give him every advantage, his parents sent him as an adolescent to Paris for study at the *lycée* Charlemagne. A bright student, he subsequently enrolled in both the faculties of law and of medicine at the University of Paris, though he never earned a degree. Instead, he became involved in the republican opposition to the restored Bourbon monarchy (1814–30), both as journalist and conspirator in the secret societies of that era.

Blanqui played a significant role in the politics of insurrection in Paris throughout much of the mid-nineteenth century. He participated in all of the popular revolutionary days save that of the Commune—1830, 1832, 1839, 1848, and 1870. He founded a series of secret societies during the 1830s, staged a spectacular if unsuccessful uprising in Paris in 1839, and gained notoriety as a club orator and political organizer during the early months of the revolution of 1848. Over the years, he was several times convicted of sedition and sentenced to lengthening prison terms by a succession of political regimes. In all, he endured some forty-three years of confinement with an ascetic self-discipline that held his admirers in awe. Famous as the youthful *insurgé* (rebel), he in time came to be known reverentially as *l'enfermé* (the imprisoned one).

As a legendary insurrectionist, Blanqui mesmerized a following of republican youth, restless under the imperial regime of Napoleon III during the 1860s. His role in his later years was as their mentor, though he briefly reentered public life as journalist, agitator, and national guard commander during the Franco-Prussian War (1870–71). His followers played a leading role in the insurrectionary Paris Commune (Spring 1871).

In old age, Blanqui's image was transfigured once more. He became the emblem of the movement for the amnesty of the Communards and was elected to the Chamber of Deputies of the Third Republic in 1879 as the personification of that cause. By then, the notion of revolution as popular insurrection was losing its force, and Blanqui had come to be respected by republicans far beyond his immediate entourage as the grand old man of a waning revolutionary tradition. He died on New Year's Day 1881 after collapsing at a political rally.

Blanqui's legend was appropriated by the twentieth-century French Communist Party, which cast him as a romantic precursor of scientific socialism. But this interpretation neglects realities in his life that shaped his thinking about politics and society. Having come of age during the Bourbon restoration, when the authority of the church and the old-regime nobility was once more prominent, his quarrel was more with religious obscurantism and aristocratic privilege than with capitalist exploitation of the working class. Blanqui was a republican, an ardent French nationalist, a champion of the oppressed, and a fighter for social justice. The French Revolution as the model for popular uprisings remained essential to his thinking about change. He never developed a coherent social philosophy, for his writings consisted largely of newspaper articles and short essays that dealt with insurrectionary tactics and current political controversies rather than abstract theoretical issues. Blanqui kept his distance from Karl Marx and Pierre-Joseph Proudhon, and forbade his followers to participate in the incipient First Workingmen's International during the 1860s. Rather he drew his political ideas from his atheistic stance on life. Central to his convictions was the idea of living courageously in the face of immediate challenges, without recourse to God or master. From a political standpoint, that motto meant maintaining one's resolve in the struggle against social injustice by appealing to empowering historical precedents, notably those of

the French Revolution. History is not about progress, he argued, but the eternal return to inspiring sources. For Blanqui, the key to revolution turned on the ability of a dedicated vanguard to awaken the latent willpower of the people to rise up against their oppression.

L'Eternité par les astres (1872), Blanqui's last, longest, and arguably most significant essay, reads as a serene reflection on redemption through the cycles of the eternal return. Like the sidereal movements of the heavens, the revolutionary movement will rise again. Blanqui's notion of the future redemption of seemingly lost causes provided consolation for the literary critic Walter Benjamin in his reflections on the plight of the political left in Europe in the face of Nazi aggression during the 1930s.

Bloch, Ernst

Ernst Bloch (1885–1977) was a German philosopher and social critic who sought to develop a Marxism that was self-consciously utopian, thereby resisting the strong current of antiutopianism in that ideology that could trace its roots to the work of Karl Marx and Friedrich Engels. Bloch studied at the universities of Munich, Würzburg, Berlin, and Heidelberg and came into contact with teachers such as Theodor Lipps, Georg Simmel, and Max Weber. He first came to prominence with *The Spirit of Utopia* ([1918] 2000), a potent brew of unorthodox Christianity, cultural (particularly musical) criticism, expressionist prose, and a deeply messianic utopian leftism. Bloch maintained that the roots of his philosophy lay in his discovery of the concept *not yet* (*noch nicht*) in 1907, a term he was to use in a variety of ways in the rest of his work but all linked to a sense of the future struggling to emerge out of the present and the past.

Marxism is merely one ingredient in *The Spirit of Utopia*, but as the 1920s progressed, Bloch increasingly began to define himself as a Marxist and to root his utopian philosophy in this ideological tradition. Politically, he became a vocal defender of the Soviet Union to the extent of publishing a defense of the Moscow show trials in 1937. Domestically, he sought to understand the emergence of fascism in Germany in works such as *Heritage of Our Times* ([1935] 1991) where he highlighted the ability of National Socialism to use and corrupt the hopes and dreams of a variety of social classes, phenomena that the left failed to comprehend. As a Jew and a

Marxist, Bloch's days were numbered in Germany, and he narrowly escaped arrest, finally finding refuge in the United States in 1938.

In his American exile, Bloch worked on what most commentators consider to be his master-piece—*The Principle of Hope* ([1938–47] 1986). It is a work on an epic scale spread over three volumes and (in the English translation) over fourteen hundred pages. Essentially, it is a study of the utopian from a variety of angles, ranging from the philosophical to the historical and from the cultural to the political, all in the service of a Marxist commitment to human flourishing. Thus, there are sections on “little daydreams,” the flights of fancy that all individuals engage in; on the nature of “anticipatory consciousness,” or where hope comes from; on “wishful images in the mirror,” expressions of hope to be found in such varied phenomena as fashion, fairy tales, travel, and film; on “outlines of a better world,” the various utopias that humans have dreamed up over the centuries; and on “wishful images of the fulfilled moment,” the most powerful conceptions of the truly human found in the sublime resources of art and religion. It thus expands the concept of the utopian beyond the rational polities and shining cities of Thomas More and his successors to encompass the manifold forms in which humanity searches for something better.

In 1948, Bloch accepted the offer of Chair in Philosophy at Leipzig in East Germany (his first academic appointment thus came only in his mid sixties). Although his appointment was clearly facilitated by his pro-Soviet, pro-communist background, Bloch was to fall foul of the East German party-state that began to see linkages between his idiosyncratic Marxism and oppositional currents, particularly among his students. He was removed from teaching, endured stinging criticisms from the press, and came close to imprisonment. In 1961, while on a visit to West Germany, the Berlin Wall began to be constructed, and he decided to stay in the west, becoming, until his death in 1977, Professor of Philosophy at the University of Tübingen.

His last decade and a half, when he was in his eighties and nineties, saw the publication of a number of works in which he continued to develop and refine his theoretical system. He produced a book on natural law (*Natural Law and Human Dignity*), one on his long-standing preoccupation with the

radical potential of Christianity (*Atheism in Christianity*) with its teasing and provocative claim that “only an atheist can be a good Christian; only a Christian can be a good atheist,” and his final work *Experimentum Mundi*.

Bloch’s engaging exploration of such a wide range of disciplines and phenomena has always attracted a highly varied readership. Currently there is a growing use of his work among those who have a scholarly and/or political interest in utopianism, while there has also been a renewed interest in his radical analysis of religion as the question of the relationship between religion and politics has acquired a new salience in the contemporary world.

Bolívar, Simón

Unlike many of the great political thinkers such as Francois-Marie Arouet Voltaire and Montesquieu, whose radical ideas were published in novels or expansive treatises written over many years, Simón Bolívar's (1783–1830) political thoughts are contained in a relatively short series of public documents. Rather than electing to write them as a social or political observer, he was driven to put his ideas on paper while conducting and participating in the struggle to liberate South America from Spanish domination. His ideas were not new; many of them are to be found in classical Greek and Roman culture and in the literature of the Age of Enlightenment. His genius was in putting them together in such a way that his vision for postrevolutionary society could clearly be seen. Neither a career politician, military man, nor what could be called a member of the intelligentsia, when the situation demanded, he demonstrated that he had a profound grasp of the problems the colonies faced and the determination and tenacity to implement his ideas. This ability can be attributed to his upbringing and education; although during that period of his life, his youthful actions and behavior showed no signs of the traits that would mark him out as a world political visionary or earn him the sobriquet Liberator.

Bolívar was born in Caracas into a wealthy and powerful family of Spanish descent. The Bolívar lifestyle was steeped in the Spanish tradition, although the idea of separatism was gaining ground among the upper echelons of South American society. His father died when he was three. The young Bolívar was intelligent but hyperactive and disruptive, and even though he

had a series of distinguished tutors, among them Andres Bello, the Venezuelan poet and legislator, he was difficult to teach. Just before Bolívar's mother died in 1792, she engaged the services of Simón Rodríguez, a radical thinker whose educational methods were based on Jean-Jacques Rousseau's *Emile*. Rodriguez removed Bolívar from the schoolroom in Caracas to the family ranch where the boy thrived on a regime of Spartan simplicity. Under Rodriguez's tutelage, academic study included an exposure to philosophy, which, in Bolívar's words, "formed my heart for liberty, for justice, for the great, for the beautiful."

After five years under Rodriguez' guidance, Bolívar was sent to cadet school in Madrid to complete his education. There he concentrated on riding and swordsmanship at the expense of academia but read voraciously, being particularly drawn to philosophically and politically liberal writers such as Voltaire, Montesquieu, Rousseau, Claude Adrien Helvétius, Guillaume Thomas Raynal, and John Locke. At the age of nineteen, deeply in love, he married María Teresa Rodríguez del Toro y Alaiza in Madrid. Together they returned to Venezuela, but she died of yellow fever within the year. In despair, he returned to Europe and sought solace in a dissipated life. In London, he joined the Gran Reunion Americana Club, founded by Francisco de Miranda and frequented by South American notables intent on independence. The political atmosphere of the time was influenced by the breakaway of the United States from England (1783) and the rise of Napoleon following the French Revolution of 1789. Having witnessed Napoleon's coronation in Italy, in the company of Rodriguez, Bolívar swore an oath on the Monte Sacro in Rome to liberate South America. In 1807, he returned to Caracas and immediately became involved in the revolutionary movement.

At the beginning of the nineteenth century, the Spanish empire included much of present-day Central America and western South America. Between 1810 and 1830, Bolívar led a series of revolutions in Bolivia, Colombia, Ecuador, Peru, and Venezuela. Initial success was in the Crown's favor, but undaunted, Bolívar began to set down his political thoughts in a series of manifestos, degrees, letters, essays, and so on, such as the *Cartagena Manifesto*, the *Jamaica Letter*, *Decree on the Emancipation of the Slaves*, *Essay on Public Education*, and many more. An admirer of the American

Revolution, he also made frequent references to Greece, Rome, and the contemporary writers of his time. Bolívar was not only a military leader and statesman, but also a philosopher who developed several ideas and texts defending the independence of South America.

He repeatedly points out the advantages of centralism over federalism, which he considers the best form of government but inappropriate in an immature democracy. He also stressed that the driving force of those who seek public office should be for the good of the nation, not for the quest for power. His writings reveal that he believed passionately in the sovereignty of the people and government that guaranteed freedom, justice, and equality to all. Although he sacrificed much to bring about the society he envisaged and had dreamed of a united Latin America, his influence waned at the end of his life, and in 1830, he resigned the presidency of Venezuela. He died in penury, knowing that he was leaving behind a country governed by warlords and oligarchs in place of the despotism he fought so hard to defeat.

French politician and philosopher Louis Gabriel Ambroise, Viscount of Bonald, was born in 1754 into a noble family of Rouergue and educated by the Oratorian fathers. After his military service as a musketeer and his marriage to Élisabeth de Combescure, he became mayor of Millau (1785). During the early stages of the French Revolution, Bonald was elected to the departmental Assembly of Aveyron. He emigrated to Heidelberg after the passing of the Civil Constitution of the Clergy (1791), seeing this as an intolerable attack on his religious beliefs. On his return to France, he began to take part in the cultural life of his country under Napoleon, who appreciated his works published while in exile. He collaborated in the *Mercure de France* and associated with Louis Mathieu Molé and François-René de Chateaubriand. He enjoyed great success in the Restoration period for his strenuous defense of the monarchy. In 1815, he presented a bill against divorce. In 1816, Bonald was elected to the Académie Française as the successor of Jean-Jacques Cambacérès. He served as Member of Parliament in the Chambre from 1815 to 1822, and was nominated Peer of France in 1823. The Revolution of 1830 put an end to his political career. Bonald died in 1840.

His political thought was expressed and set out in numerous works with a strongly unequivocal theoretical foundation. The historical order is an order of rational relationships willed by God, who does not intervene in them in order not to disturb their regularity. Man cannot create a constitution just as he cannot add length to a body or weight to matter. Power is willed by God,

guarantor of earthly order. It gives historical concreteness to a metaphysical law that requires that every relationship between beings be constructed as the result of a causal action. Between cause and effect (between God and creature, between power and subject) there must intervene, as a kind of mediation, a means that transmits the causal action (the Christ). As outlined in Bonald's *Théorie du pouvoir politique et religieux dans la société civile*, published in 1796, the political equivalent of this theological pattern is double legitimation, in counterrevolutionary terms, of monarchical *auctoritas* (a causal form of power, which cannot derive from a social contract) and nobility (the medium and hinge of government action), in relation to the expectations of the populace, whose well-being and maintenance represent the sole object of the political exchange.

The mathematical formula that transcribes this relationship (*Pouvoir: Ministre = Ministre: Sujet*) can be used to develop a system (Bonald calls it a "système de la société") in which every political and social relationship can be interpreted as a specific enforcement case of a causal relationship unitarily expressed by the algorithm of power (*Essai analytique sur les lois naturelles de l'ordre social*, 1800). There is therefore no socialization circuit (family, civil society, the State) that is not bound to power, that can be conceived as separate from it (as in liberal models), or that can subsist without being ordered and maintained by it. Man is historically bound to a tradition that conserves this premise as primitive legislation. For this attempt at synthesis between historical analysis and social science, and for the overcoming of rationalist individualism that postulates the social relationship as deductible from the will, Bonald, in critical history, has often been interpreted, apart from his ideological position, as the precursor of sociology. His theory of a divine revelation of language as a precondition to the individual exercise of thought stands in contradiction to the empiricism of the eighteenth century. Clearly thus conflicting with the philosophy of the *Idéologues*, this scheme inserts the individual into a system of mediations and of preexisting political and social relationships that include him and, therefore, deprive him of sovereign claims. For this and for his savage criticism of the French Revolution, Bonald is considered one of the founders of political conservatism.

Bosanquet, Bernard

Bernard Bosanquet was born on July 14, 1848, near Alnwick, Northumberland, England, and died in London on February 8, 1923. He studied at Harrow (1862–67) and at Balliol College, Oxford (1867–70), where he was influenced by Edward Caird and T. H. Green. Upon graduation in 1870, Bosanquet was elected to a Fellowship at University College, Oxford, where he taught logic and the history of moral philosophy. Following the receipt of an inheritance in 1881, Bosanquet gave up teaching and left for London where he became prominent in adult education and social reform. In 1895, he married Helen Dendy, an influential social worker and, later, a principal member of the Royal Commission on the Poor Laws (1905–09).

A major figure in the Idealist movement in Britain, Bosanquet came to have a leading role in philosophy, publishing on a wide range of topics. He also had key roles in the Charity Organization Society from the late 1880s until the early 1920s. In 1903, he returned to professorial life as Professor of Moral Philosophy at the University of St Andrews in Scotland but soon retired in 1908 to return to writing and social work. Despite challenges to his views from both within and outside the academic world, Bosanquet was acknowledged by the *Times* as “the central figure” of British philosophical and political thought. He received a number of honors and awards and was made a Fellow of the British Academy (1907). He died in his 75th year on February 8, 1923.

Bosanquet's political thought was influenced not only by Green and Caird, but also by classical Greek philosophy and the writings of Jean-Jacques Rousseau, Immanuel Kant, and Georg Wilhelm Friedrich Hegel.

Responding not only to the empiricism and materialism of Jeremy Bentham, John Stuart Mill, and Herbert Spencer, but also to political, economic, and social issues of the late nineteenth and early twentieth centuries, Bosanquet articulated a liberal political philosophy that sought to avoid both individualism and collectivism. It is called idealist because of Bosanquet's view that social relations and institutions are not ultimately material phenomena, but best understood as existing at the level of human consciousness. He is considered to be one of the most Hegelian of the British Idealists, though the extent of Hegel's influence has been debated.

Bosanquet's political thought is to be found principally in *The Philosophical Theory of the State* ([1899] 2001), the 4th edition of which appeared shortly after his death (1923). His views engaged reformers such as the philanthropist and social researcher Charles Booth, the Fabian socialists Sidney and Beatrice Webb, and New Liberals such as John A. Hobson and Leonard Trelawny Hobhouse. His work shows similarities to that of many of his fellow idealists (notably Green, D. G. Ritchie, William Wallace, John Watson, and to a lesser degree, F. H. Bradley), but his political philosophy is by far the most extensive and systematic—and was the principal target of Hobhouse's *The Metaphysical Theory of the State* (1918).

Bosanquet's central themes were the basis of political authority and political obligation, the role of the citizen in the community, and the nature and limits of the state. Key notions here are the individual, the general will, "the best life," society, and the state—notions that are importantly related to his metaphysics and logic.

To have a coherent account of political authority, Bosanquet argued, one must abandon certain notions usually associated with the liberal tradition, especially individualism. Bosanquet regarded political authority and the state as natural and as expressions of what he called the real or general will—and based neither on individual consent, a social contract, nor de facto recognition of sovereignty. He saw a relation between this real will and the

common good that is its object and that he identified with the best life —“the existence and the perfection of human personality.” So far as the state reflects the general will and this common good, it has authority and citizens are obliged to obey.

For Bosanquet, the well-being of the individual is inseparable from the community. Liberty is essential to the development of moral character, but there is no incompatibility between liberty and the law. Individuals are social beings, and there are substantive social ends or a common good within the community. One’s rights are based on one’s station or function in the state, and the duties that follow from it.

Bosanquet described the role of the state as the hindrance of hindrances to the best life. The state employs restraint and force and is absolute because society requires a coordination of activities; it is the flywheel of social life. While there were no a priori restrictions on state action, there were a number of practical limitations. The state cannot directly promote morality —this idea reflects the influence of Kant—and he believed that social progress could often be best achieved by volunteer action. Strictly speaking, there are no rights against the state, but where social institutions are corrupt, there can be a duty to resist. Bosanquet held out hope for an organized system of international law, and he saw the League of Nations as reflecting the beginnings of a genuine community of humanity.

Bosanquet’s political thought has been challenged for being too metaphysical, ahistorical, and unaware of concrete economic reality, too narrow and negative, too individualistic (and paradoxically, as devaluing the individual), prone to quietism, and serving to legitimate the status quo. Such attacks have been addressed in discussions (Nicholson 1990; Sweet 1997, 2007; McBriar 1987), and recent studies confirm that Bosanquet was an active Liberal. He held that the state can have a positive role in the promotion of social well-being, was in favor of worker ownership, and in the 1910s, supported the Labour Party. His familiarity with political, economic, and social issues led Adam Ulam to note that *The Philosophical Theory of the State* “has a comprehensiveness and an awareness of conflicting political and philosophical opinions which give it a supreme importance . . . Bosanquet is both a political theorist and a political analyst”

(Ulam 1951, 50). Bosanquet's view of the individual, the common good, and the role of the state seem to be echoed in recent writings by Charles Taylor and William Galston, and several writers have found his work relevant to the recent liberal-communitarian debate.

Bureaucracy

Formal organizations responsible for implementing public programs are as old as government itself. Studies of ancient empires such as those by Eisenstadt and Finer identify large formal organizations as central to the governance capacity of those governing systems. Although many members of these organizations were selected for personal loyalty to the monarch or on the basis ascriptive criteria, some such as the Chinese Mandarins were selected on the basis of merit and had the prospect of a lifetime career. These organizations were some of the earliest modern organizations in the public sector.

The Nature of Bureaucracy

Although the utilization of formal organizations to implement public policies is as old as government, the term *bureaucracy* is not as old. The term is usually associated with the late nineteenth-, early twentieth-century German social theorist Max Weber. Weber described bureaucracy in light of his theories about social development and particularly the shift of legitimation from traditional to charismatic to rational legal forms. Rational legal authority represented the highest form of development and modernity, and the bureaucracy was the organizational format associated with that type of authority. Although usually associated with the public sector, private sector organizations may have many of the same bureaucratic characteristics.

Bureaucracy, therefore, is to some extent a general conception of governing as well as a theory of organization, although it is discussed most often as a theory of organization. As a theory of organization, bureaucracy has a number of components, for example, recruitment by merit, a full-time job and a lifetime career, formal rules, and organizational memory contained in files. The name *bureaucracy* was derived from the French *bureau* and its many drawers. Thus, a bureaucracy is a structure that is highly differentiated with a number of offices and positions, all linked by hierarchical controls and rules.

These attributes combine to create organizations in which the individual bureaucrat willingly suspended his or her judgment in favor of accepting the rules and the hierarchical controls from the leadership of the organization. In so doing, the bureaucrat was able to treat clients *sine irae ac studio*, that is, according to strict legal guidelines rather than according to personal whims. This equality was to be seen in contrast to treatment of citizens differently according to ascriptive criteria such race or gender, or according to their political affiliations as in traditional or charismatic forms of governing.

Weber's conception of the bureaucracy was an ideal type, meaning that it was intended as an intellectual model rather than as an abstraction from reality. Therefore, perhaps no organization has ever been a full-fledged bureaucracy. Empirical studies such as Stanley H. Udy's (1958) have identified organizations with many of the attributes but few if any that attained the goal of being a complete bureaucracy. As an intellectual device, however, the concept constitutes both a set of categories for organizational analysis and an attempt to embody how a modern organization would look and perform. By comparing existing organizations with that model, we can understand how they are likely to function and how they relate to one particular conception of modernity.

The words *bureaucracy* and *bureaucratic* are usually considered pejorative, indicating organizations that are excessively rigid, dominated by red tape, and slow to respond to the needs of the public. The original intent of the bureaucratic model of organization, however, was more positive. For example, this form of organization would treat individuals—both

employees and clients—with strict equality rather than on particularistic grounds. The emphasis on formal, knowable rules and the existence of files were mechanisms to enhance the transparency of organizations so that clients and citizens could know what procedures were being followed and where their particular case was in that process. Not all public organizations are in reality that open, but that is less the fault of the model than of the individuals who implement it.

Critiques of Bureaucracy

The concept of bureaucracy has been critiqued from a number of perspectives. First, the concept has been criticized on normative grounds because it requires individuals to suspend their own judgments about what is right and wrong and to follow the rules of the organization. The normative critique was especially strong after World War II when the consequences of individuals failing to make moral judgments became vividly apparent. Even in less extreme circumstances, individual public servants are faced with important choices that require them to make moral and legal judgments.

Such a standard for behavior makes it more likely that people will “just follow orders,” and it also dehumanizes the individual public servants working within those organizations. The Weberian bureaucrat in the extreme may be reduced to an automaton who does not have any latitude to make decisions and who is not responsible for any decisions. This model of organizations assumes that individuals do not want autonomy and/or responsibility; they are willing to accept security rather than pursue the opportunity to maximize their own skills and their contributions to the organization. In the contemporary world, these assumptions about individuals appear extremely dehumanizing, but in the time at which Weber wrote, they were prevalent.

Not only do the assumptions about human nature have normative consequences, they can also affect the manner in which the organization performs its tasks. As a theory of organizations and management, bureaucracy seems best suited to organizations that perform simple repetitive tasks and that have limited direct contact with the public. These

“machine organizations,” as Mintzberg (1983) called them, are capable of coping with tasks such as issuing licenses or paying monthly pensions but are incapable of coping with greater complexity or uncertainty. Likewise, the so-called classical approach to public organizations that grew out of bureaucracy also focused on relatively simple principles for managing organizations, again assuming that the individuals within the organizations did not want to make decisions on their own and that the organization did not need that flexibility.

Although the bureaucratic form may be capable of coping with repetitive tasks, it may not be as efficient in managing those functions as Weber had assumed. Almost all public programs, or indeed private activities, involve discretion, and an organization that attempts to either deny or to suppress discretion is unlikely to be successful in achieving its tasks. Further, the clients of such an organization are unlikely to be treated as mere cases and therefore may demand more consideration from their service providers. Also, bureaucracy and rules are inherently incapable of managing the complex regulatory and policy-making functions that now are central to the work of the public sector.

Somewhat paradoxically, the equality of treatment that bureaucracy was designed to create is satisfying neither to the providers nor to the recipients. Individual public servants want some latitude to make their own decisions and the clients want their special circumstances recognized and responded to. Rather than the virtues of equality and predictability that advocates of bureaucracy may see, clients see rigidity and formality. This frustration with formal organizations and the dominance of rules is especially apparent at the street level, where public employees confront citizens who want better and more considerate treatment.

The dissatisfaction with the bureaucratic model on both normative and empirical grounds has generated a number of alternative approaches to understanding organizations and especially, organizations in the public sector. The first of these to emerge was the human relations approach, arguing that organizations would perform better if the individuals within them were treated more as individuals than as cogs in a bureaucratic machine. This strand of thought constitutes, in various guises, the basis of

most contemporary organization theory; although unlike bureaucracy, it expresses relatively less concern with the clients of organizations than with the employees of the organizations.

Herbert Simon (1947) and the decision-making approach to organizations was a reaction to both bureaucracy and classical organization theory. Simon argued that the mechanistic nature of bureaucracy, and the simple platitudes of classical administrative theory, were incapable of coping with the complex and competing demands of organizations within the public sector. Therefore, to understand organizational behavior, we need to understand the manner in which decisions are made and the premises on which those decisions are made. Further, Simon and his associates (March and Olsen 1989) argued that the decisions taken were conditioned by the values, routines, and symbols of the organizations to which the individual belongs so that decisions did not represent rational decisions that would maximize individual utility but rather reflected bounded rationality.

The most extreme rejection of the bureaucracy model for public administration can be found in the new public management (NPM) (see Hood 1991; Christensen and Lægreid 2001). This approach to public organizations stressed the pursuit of efficiency through the use of managerial principles similar to those used in the private sector. The assumption was that public and private sector management were essentially the same and that government could be improved by using techniques that appeared to have worked in the private sector. Further, the NPM emphasized the role of the manager in creating that efficiency and de-emphasized or even denigrated political influences over policy and management.

In many ways the new public management is the antithesis of bureaucracy. For example, as Peters (2004) notes, while bureaucracy was built on rules, internal deregulation is one of the principal methods of NPM, with the assumption that strict rules over functions such as budgeting and personnel management prevented effective public managers from achieving their goals. Hierarchy and the control exercised by the managers are important in NPM, but *ex ante* constraints on decisions are considered not only to waste

the skills of talented individuals within public administration, but also to reduce the efficiency and effectiveness of government.

Likewise, rules also prohibited employees at the bottom of public organizations from working effectively with their clients. The logic of the NPM is to serve the customer. This market logic of treating clients differently according to their needs and preferences is in marked contrast to the rule-based equality at the heart of bureaucracy. While the NPM approach may provide the clients of public programs greater choice, it does violate the basic principle of equality in public services. Further, it may advantage the more articulate clients rather than the less advantaged who may need public services more.

Bureaucracy and the NPM also have very different conceptions of public accountability, perhaps the principal democratic element of public administration. For bureaucracy accountability is conceptualized as being enforced *ex ante* and largely within public organizations themselves. Rules and hierarchical authority are assumed to be able to have public employees follow the law and to perform their functions in the public interest. On the other hand, accountability in the NPM is conceptualized as being *ex post*, with managers having the latitude for action but then being assessed on the outcomes. This process also shifts the conception of accountability more toward outcomes rather than on compliance with rules.

Despite the numerous attempts to generate alternatives to bureaucracy, and despite the numerous problems inherent in the bureaucratic form of organization, it continues to reappear as a model for the public sector (see Du Gay 2004; Olsen 2006). Advocates of the neo-Weberian society argue that the adoption, or re-adoption, of some of the values and practices of Weberian bureaucracy is essential for restoring some of the probity and equality of bureaucracy. The managerial task, therefore, becomes finding ways to marry the search for efficiency associated with the new public management with the accountability of bureaucracy.

In summary, bureaucracy has been and remains a central concept for public administration. The formal organizations associated with bureaucracy were effective in creating equality and adherence to rules but had a number of dysfunctions such as rigidity and an absence of responsiveness. Those

dysfunctions have produced a pervasive negative stereotype of bureaucracy and of government organizations in general. That negative stereotype has been justified in a number of cases, although the positive benefits are often ignored. The numerous alternatives to bureaucracy that have been created have addressed some of the dysfunctions of bureaucracy but have created numerous dysfunctions of their own.

The question for designing public administration, therefore, becomes how to balance these various dysfunctions and positive features in public organizations. As has so often been the case in the design of public administration, there has been a pendulum moving back and forth between more bureaucratic forms and less formalized patterns of management and organization. It appears that some movement back toward bureaucracy is now occurring, after decades of managerialist and decentralizing reforms.

Burke, Edmund

Edmund Burke (1730–97) is recognized today as one of the founders of conservative political philosophy, although in his own day he enjoyed a reputation as a Whig critic of government policy in domestic, imperial, and foreign affairs. In the early nineteenth century, he was taken up by conservative opponents of franchise reform in Britain; however, he attracted liberals later in the century as a proponent of moderation. This apparent adaptability does not mean that Burke's thought transcends political categorization, but that characterizing him ideologically requires precise historical sensitivity. Burke was not a political philosopher, but a practical politician, forced under pressure of events to respond to political opponents. But while his political thought is thus circumstantial and context-specific, he also framed his positions with due regard to long-term consequences. Most of what has come down to us as his political theory originally took the form of public letters and speeches, but his writings nonetheless aimed at general political understanding. His interventions tackled issues of immediate importance, but these included events of epochal significance.

Burke's career spanned one of the most remarkable periods in British and European history. He lived through and chronicled the events of the Seven Years' War (1756–63). At the same time, he witnessed the establishment of the British Empire in India (1756–65). The American crisis (1765–83), culminating in the loss of the thirteen colonies, began during his first period in public office. As a member of Parliament, he engaged with the great issues in the domestic politics of the day, from the Wilkes affair to the

toleration of religious dissent and demands for constitutional reform. He also addressed imperial disputes ranging from Ireland to Quebec. And finally, he became a central protagonist in the debate on the French Revolution. It was in relation to these issues and events that he elaborated the key doctrines with which he has since been associated—the wisdom of reform as opposed to revolution, the necessity of prudence in political affairs, and the historically rooted character of political rights and duties.

Early Life and Career

Burke was born and educated in Ireland before moving to London to train as a lawyer at the Middle Temple in 1750, but in the mid-1750s he embarked upon a career in journalism and letters. He was soon committed to a number of important literary enterprises, including history, criticism, and political commentary. By the end of the decade, he had published *A Vindication of Natural Society* (1756) and *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757); he had coauthored *An Account of the European Settlements in America* (1758) and started work on *An Essay towards an Abridgement of English History* (1757-?). After a period as secretary to William Gerard Hamilton (1729–96), during which he continued his editorship of the *Annual Register*, he accepted the post of secretary to the Marquis of Rockingham (1730–82) and a seat in the House of Commons in 1765. By that stage, he had already cut a figure in the literary world of London. He had befriended Samuel Johnson (1709–84) and become an intimate of Joshua Reynolds (1723–92); he had encountered David Hume (1711–76) and corresponded with Adam Smith (1723–90). He was an early if cautious disciple of Montesquieu (1689–1755), an antagonist of Jean-Jacques Rousseau (1712–78), a critic of Henry St John Bolingbroke (1678–1751) and François-Marie Voltaire (1694–1778), and a reviewer of the Scottish conjectural historians William Robertson (1721–93) and Adam Ferguson (1723–1816).

Burke's career is distinguished by the caliber of his commentary on public affairs. He brought an intelligence steeped in Enlightenment intellectual culture to the controversies in which he intervened. He liked to compare himself to Cicero (106–43 BCE), but the comparison does not quite fit: Burke's positions were not developed after retirement from the public stage,

but in the midst of the cut and thrust of politics and polemic. Nonetheless, his arguments were designed to probe beneath the surface of events. He sought to add philosophical depth and historical reach to contemporary disputes. By the 1790s, he had managed to achieve international renown as an original thinker. Like Montesquieu or James Madison (1751–1836), he strove to develop a theoretical approach to politics. However, as we have seen, his arguments were tied directly to the rhythms of public life. Yet despite the circumstantial character of Burke's doctrines, a pivotal concern connects his interventions in public debate.

Key Political Concerns

Despite his immersion in quotidian affairs, Burke's engagement with public life can be characterized in terms of a central and abiding preoccupation. A proper appreciation of this core concern enables us to uncover the guiding principles that shaped his response to the burning issues of the day beyond the domestic front: that is, issues connected with America, India, Ireland, and France. This pivotal interest focused on the threat posed by the spirit of conquest to modern enlightened political conduct. The spirit of conquest referred to the predominance of naked power politics over the politics of conciliation and consensus. At the extreme limit, as Burke recognized, power politics shaded into military usurpation—the assertion of might as the sole criterion of right. The core of his political thought draws on a historical vision of how Europe overcame the spirit of conquest that dominated life after the fall of the Roman Empire. That vision sought to account for the emergence of constitutional politics at the expense of the spirit of conquest. The modern acquisition of constitutional regulation represented for Burke a high point of civilization that surpassed the finest achievements of the ancients. Nonetheless, modern civilization remained a precarious achievement. It was the job of politics to guard against its collapse under pressure from rival elements within its formation.

Burke saw that the forces that built up postclassical civilization were embodied in the orders and powers that made up modern monarchies and republics. These social orders and forms of power had been variously distinguished from one another and combined into diverse kinds of political systems in the Europe of Burke's day. The success of each of these systems

depended on its capacity to approximate the ideal of the rule of law. But progress toward that ideal rested on the establishment of judicial independence.

Burke believed that the security of judicial independence, along with the peace, justice, and prosperity that security maintained, depended on the preservation of a harmonious arrangement of checks and balances between the elements that composed the political system of which judicial power formed a part. His attention was continually absorbed by the question of the best means of maintaining an optimal balance and the consequences that would follow from disturbing this equilibrium. Serious disturbance risked pitting prevailing political forces against one another, leading to the disintegration of the community into antagonistic factions and the resort to armed contention over the sovereignty of the state. It was Britain's good fortune to have withstood this abysmal fate in the eighteenth century; however, Burke felt sure that France was reverting to militant factionalism in 1789. As a result, he contended that it was with the advent of the French Revolution that the spirit of conquest was dramatically relaunched at the heart of European civilization.

Development of Political Commitments

Burke's preoccupation with the spirit of conquest underwent various developments between the mid-1750s and the mid-1790s. It also provided the framework in which he examined a range of related themes, including despotism and democracy, persecution and fanaticism. His early career down to 1780 amounts to a defense of the balance struck by the Glorious Revolution settlement of 1688, delivering Britain from the threat of civil discord and collapse. The firmness of Burke's commitment to the Glorious Revolution was partly a product of his awareness of how the Revolution settlement had miscarried in Ireland. From Burke's perspective, the settlement in Ireland was less an agent of pacification than the consummation of conquest by constitutional means. However, much of his early reforming zeal derives from his commitment to the British constitution as an instrument of progressive pacification. Its characteristic balance in favor of liberty was a means of reducing precisely the kind of factional hostility that resulted from the Williamite conquest of Ireland.

Down to the Gordon Riots (1780) and the loss of the American colonies (1783), Burke's political priorities consisted in warding off what he took to be the principal threat posed to the fundamental principles of the Revolution settlement at home while extending its civilizing influence abroad.

Policy for the empire was thus formulated in the light of the need to maintain the domestic constitutional balance. From the debates about party and protest in the 1760s down to the American crisis of the mid- to late-1770s, it was the ambitious designs of the monarchy of George III that appeared to pose the greatest danger to political harmony in Britain and by extension, to the stability of the Empire. However, the joint impact of civil unrest at home and the loss of the colonies in America between 1780 and 1783 led Burke toward a radical reappraisal of the sources of political instability. He now feared the rising tide of populism and demagoguery as a potential source of constitutional subversion. The Gordon Riots reminded him of the intensity of persecuting zeal, while the struggle with America made clear the subversive appeal of the doctrine of natural rights.

Both of these developments pointed to the decline of a style of responsible politics rooted in the Revolution settlement of 1688. Burke took the view that this style of politics had been founded on the coordination of relationships among the democratic, aristocratic, and monarchical components of the British constitution. Late in his career, he described this coordination of powers representing the distinct orders and interests of the British state as exemplifying republican government in its accepted sense before the advent of the French republic. Here he had in mind the Ciceronian ideal of a mixed polity dedicated to the security of property and liberty.

However, Burke still believed that both property and liberty had been more securely underpinned in modern states by the survival of the principle of heredity in postfeudal European politics than they ever were in the politics of Greece or Rome. Nonetheless, he further emphasized the fact that the contemporary world was not immune to corruption leading to terminal crisis. The resurgence of the idea of popular rights in the domestic politics of Britain was one sign of the onset of impending crisis. But the corruption of the ideal of mixed or republican government was even more

conspicuous, Burke argued, in the oligarchic politics of the East India Company. More dramatically still, as he began to claim after 1790, the democratic fundamentalism of the French Revolution threatened to extinguish the very idea of a mixed constitutional order.

It was an 18th-century commonplace that the spirit of conquest that dominated ancient politics had been caused by the unstable balance of forces in mixed polities such as that of Rome. It was likewise commonly recognized that the resurgence of that spirit after the fall of Rome was a consequence of the establishment of military aristocracies during the aftermath of the invasion of the German tribes. Burke came to fear that the same spirit threatened to reappear in Europe with the corruption of modern mixed systems of government under pressure from their pure elementary components. While the oligarchic politics of the East India Company had introduced the spirit of conquest into the East, the democratic politics of revolutionary France seemed poised to embark on the reconquest of Europe.

Burke's perspective on the spirit of conquest shows that he was never a critic of empire as such, but a critic of empire based on the spirit of conquest; he was never the enemy of reform in France, but an opponent of reform through revolution. So much is evident from his responses to events in India, America, and France. In the case of India, his views underwent important, even radical shifts. After his early justification in the 1770s of the East India Company's trading monopoly in South Asia in terms of a defense of corporate rights necessary to the maintenance of a Whig balance in the British constitution, Burke came to see the Company's servants as embodying an anachronistic spirit of conquest in a period that he described as "this enlightened age." In connection with America, he thought that the best hope for the future of the American colonies lay within the British Empire, but he also believed that the prospect of a happy resolution of the conflict between colonial rights and monarchical privilege had been damaged from the outset by exaggerated fears of conquest on one side and exaggerated political pretensions on the other. He was never truly a friend to either side in the dispute.

Burke's engagement with France was more complex still. French revolutionary ideology identified France's constitutional arrangements with

various forms of gothic usurpation, but for Burke, the monarchy contained within it the means of its own reform. However, in declaring war on the existing political set up in France, the Revolution inadvertently reintroduced the spirit of conquest into European politics, threatening the continent with military monarchy and Britain with subversion.

Burke first came to the conclusion that the spirit of conquest lingered as a threat over the achievements of modern enlightened politics as a result of the firsthand comparison he was able to make between the political malformation that beset his native Ireland and the relative freedom from sectarian strife that Britain enjoyed in the eighteenth century. The spirit of conquest, he believed, grew out of the spirit of persecution. Whiggism supplied the constitutional means of defusing the energies of this spirit by subjecting the will to conquest to regular political controls. Throughout his career, Burke supported successive means for countering the recrudescence of the spirit of conquest in British, European, and imperial affairs with what might be termed a *politics of conquest* capable of containing its destructive influence.

These assorted attempts to develop cogent political responses to the survival of the spirit of conquest into the age of Enlightenment culminated in the 1790s with Burke's radical conclusion that the militant will to conquest unleashed by the French Revolution could not be tamed, but could only be conquered. This left him demanding a zero-sum confrontation between the counterrevolutionary empire of civilization that he supported and what he represented as the fanatical empire of light and reason that he had watched grow up in France. It is a fascinating irony of Burke's thought that his gospel of Whig moderation culminated in a defense of a doctrine of extreme implacability, beginning with his great work *Reflections on the Revolution in France* (1790) and achieving its final form in his *Letters on a Regicide Peace* (1795–97). It is this aspect of his work that in due course earned him a reputation for being the founding father of modern conservatism. But it contrasts markedly with the tone of his America speeches twenty years earlier. This does not so much point to the existence of contradictory principles in Burke's thinking as to a single interpretation of Whig principle deployed under divergent historical circumstances.

America, India, and France: Dissent, Despotism, and Fanaticism

Between his first public statements on the rights of the American colonists and the publication of his great speech *On American Taxation* (1774), Burke sought to reconcile the principle of colonial freedom with the demands of imperial authority. His repeated public avowal of the delicacy involved in maintaining the Empire upon a plan of Liberty, together with his criticisms of the government in the wake of the introduction of the Townsend Duties (1767) and the Tea Act (1773), gave rise to the mistaken impression in the colonies and at home that Burke was a partisan of natural rights when it came to colonial affairs. It is nonetheless clear that Burke had all along been alarmed by the dissidence of dissent in America. He sought to reconcile this dangerous tendency with the rights of imperial authority by the reestablishment of public trust. This, he contended, could be achieved by a reversion to historic rather than natural rights. Down to 1776, Burke believed that the British constitution still had the capacity to inspire fidelity, and with it subordination, among the American colonists. The restoration of trust required that the constitution of the Empire be reconfigured according to its original principles. But in the midst of the American crisis, Burke also saw that it was trust that was conspicuously absent between the East India Company and its Indian subjects, thus threatening the British Empire, and its claim to justice, in the East.

By the early 1780s, Burke had acquired knowledge of Indian affairs so extensive as to be virtually without comparison among commentators on the subcontinent with the exception of well-placed East India Company servants who had accumulated significant experience of India on the ground. Burke's reading—of histories, pamphlets, and Company records—was enormous; and he had interviewed innumerable participants in Indian politics and commercial activity. On the basis of this research, he came to view the situation in the subcontinent as a product of multiple processes of usurpation. It was, he thought, a product of two distinct styles of conquest. In the first place, India had survived successive waves of Arab, Tartar, and Persian invasion. But the ferocity of these early inundations soon abated, Burke contended; the Asian conquerors made the newly subjugated country

their own. However, things were very different as far as the mode of conquest pursued after the arrival of the East India Company went: now the pacified territories of conquered Hindustan were disrupted by an unremitting despotism imported from the West. The challenge for Burke became one of elaborating the principles and discovering the means capable of holding the Company to account.

Burke's perspective on Company misrule in India was guided by principles that informed his political outlook more generally, not least his basic belief in a providential order of which the gift of terrestrial government formed a part. These principles received their fullest articulation during the impeachment of Warren Hastings, including the preparation of the original articles of charge in the mid-1780s and extending down to the final failure of the prosecution two years before Burke's death in 1795. Throughout this period, Burke appealed to the principles of Christian universalism against the local, geographical morality invoked by Hastings in justification of his conduct in the East. However, this universalism was not employed in support of practical political maxims derived from natural law. In fact, Burke offered a utilitarian defense of the ancient Indian constitution as the most immediately effective means of indicting the arbitrary despotism that he associated with East India Company rule even though it is perfectly plain that he viewed British principles as embodying a higher form of justice. His writings on India show him pitting what he took to be the true principles of a British constitutional politics against the Indianism unleashed by despotic Company rule.

The last ten years of Burke's life were devoted to the exposure and destruction of Indianism and Jacobinism together—twin enemies, from Burke's perspective, of enlightenment and civilization. By the mid-1790s, Burke went so far as to equate the tyranny of Indianism with the rebelliousness of Jacobinism, explaining both in terms of an insatiable appetite for power. Burke took Jacobinism to be both the original inspiration and the driving force behind the Revolution. Accordingly, sometime after the early autumn of 1789, he set about uncovering its inner purpose and motivation. In the mid-1790s, he described it as “the revolt of the enterprising talents of a country against its property,” but he had arrived at that diagnosis as early as February 1790. At that early stage, the

Revolution already appeared to him as an atheistical movement bent upon the establishment of a ruthless democracy.

This dual purpose determined the Revolution's character in Burke's eyes as a revolt against both property and religion. Yet both these objectives seemed wildly counterproductive. From Burke's perspective, the attack on religion would ultimately produce new forms of superstition, while a democracy, which aimed at subverting property, would end in a program of absolute domination. Both irreligion and popular fanaticism were indebted in Burke's mind to what he described in the *Letter to a Member of the National Assembly* (1791) as the "philosophy of vanity." It was Rousseau who stood for Burke as the artful progenitor of modern vanity or self-regard. On this interpretation, the *Confessions* (1782) and the *Reveries* (1782) preached a doctrine of radical self-absorption, hypocritically masking self-regard through protestations of virtue. It was this distinctly modern form of hypocrisy that undermined the influence of shame and honor on the fabric of society. The philosophy of vanity thus fostered systematic unsociability. It helped, in the process, to undermine the sentiment of religion, whose fundamental guiding impulse was the feeling of humility. However, the Revolution could not succeed by proselytizing philosophy alone. It had to appeal to regular passions, like envy and injustice. Together, this medley of emotions led to belligerence and unrest.

Burke was disposed to think of the Revolution as inherently bellicose; even when not actually engaged in combat, revolutionary France was in an apparent state of readiness for war. Two factors placed the country in this position, distinguishing it from all previous belligerents in European history. First, the moving spirit of the Revolution appeared to Burke to be both militant and implacable. Second, even in the absence of a direct military threat, it posed a danger to the other powers of Europe. That danger derived from the infectious proselytism disseminated by the Revolution's chief protagonists. Their commitment to democratic dogma put them at war with the civilized states of Europe. That war, as Burke saw it, was a kind of total war. It could only be brought to an end by destroying the Revolution itself.

Having made his political reputation as an exponent of conciliation, Burke ended his career as Europe's most articulate champion of counterrevolutionary war against France. These dramatically contrasting programs of action are based on a consistent interpretation of a basic political principle whose origins lay in an aversion to the spirit of conquest. The only alternative to conciliating America, Burke saw, was to conquer it, thereby undermining the purposes of the British government. However France after 1789, Burke reckoned, could not be conciliated. The anti-Christian spirit of persecution and demagoguery that imbued the Revolution with its singularity of purpose could neither be diverted nor pacified. Confronted with a political movement that aimed at the subversion of its own principles, Burkean Whiggism revealed the limits of its commitment to moderation. Prudence succumbed to drastic extremes; reform gave way to reaction.

Calhoun, John C.

John Caldwell Calhoun (1782–1850) was born in 1782 near Abbeville, South Carolina. His educational opportunities were limited, but after his parents' death and a period of self-education, Calhoun entered Yale College, studying under the arch-Federalist Dr. Timothy Dwight. He later studied for two years under Judge Tapping Reeve at the Litchfield Law School, the most prominent institution devoted to legal training during this period. Returning to his native South Carolina to practice law, he served two terms in the South Carolina Legislature until elected to the U.S. House of Representatives in 1811. As a member of Congress, Calhoun acquired the reputation as a moral statesman who regarded republicanism and patriotism as synonymous: he supported the War of 1812, he revised James Madison's original national bank proposal and backed limited internal improvements, and he continued to praise a free economy and a regime founded upon "reason and equity" that was surrounded by a world of "fraud, violence or accident."

President James Monroe asked Calhoun to assume the helm at the War Department in 1817, where he served until 1825. Calhoun was generally considered too philosophical for such a practical post, but he accepted the appointment out of a republican sense of duty. In the course of two terms in office, Calhoun completely reorganized and revitalized the War Department and its general staff, resolved its financial problems resulting from the war, and demonstrated a new, more compassionate approach to Native American

affairs. Calhoun also began reforming West Point through a new spirit of openness in terms of admissions and administrative procedures.

A broad spectrum of supporters encouraged Calhoun's candidacy for president in 1824 against his fellow cabinet members William H. Crawford and John Quincy Adams, Speaker of the House Henry Clay, and war hero and newly elected senator, Andrew Jackson. Initially entering the presidential field, Calhoun realized he lacked adequate support and withdrew after Pennsylvania nominated Jackson. Accepting the vice presidential nomination, Calhoun was elected by a large majority. The results in the presidential contest between Jackson and Adams were inconclusive in terms of the electoral and popular vote, and the election was thrown into the House of Representatives where Jackson's nemesis Clay served as speaker. In an unusual series of events, Clay came to Adams's aid, with the House vote securing the election for Adams, who appointed Clay as secretary of state. Many Americans considered the supposed arrangement between Clay and Adams a corrupt bargain. Calhoun believed the bargain had disrupted the balance between preserving liberty and assuming power explicitly reserved to the people. He began to separate himself from what he considered to be Adams's abuses of office and supported General Jackson in 1828. It was as part of this ticket, later known as the Democratic Party, that Calhoun was elected vice president in 1828.

The falling apart of the political union between Calhoun and Jackson is one of the most remarkable events in American politics. Calhoun had hoped Jackson would assume the republican political mantle, but his expectations were not fulfilled. When Jackson decided to seek a second term and selected Martin Van Buren as his vice presidential candidate, several controversies were ignited that raised questions about the corruptibility of the administration.

As a result of the dispute with Jackson, Calhoun resigned as vice president and was elected to the Senate. In an attempt to moderate the crisis posed by tariff-related concerns and the Force Bill in 1832, Calhoun questioned the prospect of preserving the union by force and not relying on the harmonious aggregate of the states. Up to this point in his career as a statesman, Calhoun had made few statements regarding slavery. Troubled by the

increasing influence of abolitionism and the rise of sectional conflict, Calhoun would devote the remainder of his life to defending the South and attempting to avoid conflict. Retiring from the Senate in 1843, he unsuccessfully pursued the presidency for the last time. In 1844, Calhoun was appointed as secretary of state.

Returning to the Senate in 1845, Calhoun served as a thoughtful critic of the war with Mexico and suggested the conflict would encourage disharmony between the North and South. In 1844, Calhoun had helped contain a truly revolutionary “Bluffton Movement” composed of his fellow South Carolinians. Many leading South Carolina politicians threatened drastic responses to a troublesome new tariff and the questionable status of Texas. Calhoun’s success at moderating the conflict demonstrated both his restraint in a crisis situation and his lack of control over the politicians who supported him.

Calhoun’s mature political ideas focused upon a defense of states’ rights and limited central government, and the vindication of the institution of slavery. His conception of republicanism highlighted the dangers of majoritarianism in federal politics, and the virtues of localism and a decentralized agrarian society. His concept of the “concurrent majority” was Calhoun’s chief proposed safeguard against majority tyranny, though it is usually pointed out that the minorities that interested him were landed elites. These ideas were outlined in the *Disquisitions on Government* and the *Discourse on the Constitution and Government of the United States*, both published shortly after Calhoun’s death, in 1850.

Calhoun’s persistent concern about the unequal treatment of the South would, he feared, lead to increased regional tensions and to civil war. His last years were spent attempting to unify the South and avoid strife. On March 31, 1850, Calhoun died in Washington, D.C. In death, Calhoun became a source of inspiration for the Confederate government, its leaders, and the South. Calhoun’s understanding of restraint within political order, albeit imperfect, remains one of the most important characteristics of his political thought and his achievement as a statesman. In Calhoun’s interpretation, the interposing and amending power of the states implicit in the Constitution could only augment authentic popular rule by allowing for

a greater diffusion of authority. Calhoun's purpose was the preservation of the original balance of authority and the fortification of the American political system against the obstacles it faced.

Camus, Albert

Albert Camus (1913–60) was born in Algeria and grew up in a poverty-stricken environment where a lack of material possessions was more than compensated for by the natural and free pleasures of the Mediterranean seascape. His early collection of lyrical essays, *Noces* (1939), thus celebrates how a union with the natural world can offset the devastating consequences of social hardship. But if there was little sense of personal injustice on Camus's part caused by the nature of his formative years, his own particular circumstances would give him empathy toward the plight of others, igniting a concern for justice on behalf of those who were politically disfranchised and socially impoverished. The youthful Camus dabbled in organized politics, joining the French Communist Party in 1935, only to leave shortly afterward following a volte-face in the Party's attitude toward anticolonialism, which Camus saw to be a betrayal of the Arab cause in Algeria. He went on to find work at the local anticolonialist newspapers *Alger républicain* and *Le Soir républicain*, and it is here that he first engaged in crusading journalism, writing articles and supporting causes in the manner of a self-styled revolutionary.

In the wartime period, Camus found himself in France where, writing for the clandestine *Combat*, his celebrated editorials provided a rallying cry to defend moral values in the face of Nazi nihilism. It was also during these years of austerity that Camus published *Le Mythe de Sisyphe* (1942), *L'Étranger* (1942) and the play *Caligula* (1945), followed by *La Peste* (1947) and *Les Justes* (1949), a drama centered on the complex interplay

between morality and the pursuit of revolutionary justice in what remains a work as relevant today as when the play was originally performed half a century ago. The culmination of Camus's postwar moral reasoning, *L'Homme révolté*, was published in 1951, provoking a public polemical exchange with his one-time friend Jean-Paul Sartre in the pages of *Les Temps modernes*. At the same time, events in his Algerian homeland became an increasing cause for concern for Camus throughout the 1950s, with the Algerian civil war leaving a psychological scar from which it proved impossible for him to recover. Yet these difficult years, politically, also spawned some notable literary successes: *La Chute* was published to critical acclaim in 1956, while in the following year—when Camus was awarded the Nobel Prize for Literature—he produced a collection of short stories, *L'Exil et le royaume*. And at the time of his premature death in a car accident in January 1960, Camus was working on an important new work, *Le premier Homme*, which the author himself saw to be his *magnum opus*. Published posthumously in 1994, this regrettably unfinished autobiographical novel has since provided the impetus for a renewal of interest in Camus's life and work.

Apart from his brief flirtation with the French Communist Party as outlined above, Camus was generally suspicious of using political doctrines as standards for action. A humanitarian pragmatist by nature, Camus's political instinct was that of a social reformer, striving to change the status quo on behalf of those who lacked the voice to speak out for themselves. Instinctively left wing, his lifelong preoccupation with justice was grounded in a conviction to defend civil rights and principles of liberalism in the face of tyranny and oppressive practices. While readily acknowledging the imperfections of the idea, Camus saw liberal democracy to be the best means by which to reconcile social justice and individual freedom. As absolute forms of morality, justice and freedom are contradictory and irreconcilable concepts; human prosperity, Camus insisted, is best served by a plurality of relative moral values. Failing to maintain ethical integrity in a given revolutionary campaign is to sacrifice morality on the altar of political ideology. In other words, revolutionary justice requires that the means remain consonant with the end; in Camus's political vision, the end cannot be allowed to justify the means. At the dawn of the twenty-first century, this mind-set remains acutely apposite.

Capitalism

Capitalism is currently the world's predominant economic system and, in the most basic terms, can be defined as the process of investing money in the expectation of making a profit. There is, however, no single model of capitalism, and a number of forms presently exist or have historically existed. This diversity creates some difficulties when it comes to defining the limits of capitalism, although there are common features. Of particular note are the use of the market as a mechanism, which may be free or regulated, and the existence of private property rights of some kind. Both market regulation and property rights can be affected by political considerations in different countries.

Capitalism has particularly been associated with liberalism, especially the variants advocating little or no regulation of markets. Other ideologies, including some versions of socialism, also engage with capitalism and capitalist principles, albeit often within a different intellectual framework. The principle of economic freedom is generally linked to capitalism and some commentators, most notably Milton Friedman, have argued the case for considering capitalism as a prerequisite of political and personal freedom. Conversely, other political ideologies, such as Marxism and libertarian socialism, are heavily critical of capitalism and consider it to lead to exploitation, reduction of freedom for the majority, and inequitable outcomes.

History of Capitalism

The earliest incarnation of capitalism that is readily recognizable by modern standards is mercantilism. Historical attention around mercantilism has gravitated toward the experience of British, Dutch, Spanish, and Portuguese activities, as these were the dominant seafaring powers between the sixteenth and eighteenth centuries. The definition of mercantilism as a capitalist system is open to some debate; despite its leading to a complex system of trade for profit, it did not necessitate a system of production along capitalist lines. It was, however, distinct in many aspects from the feudalist economic system.

Mercantilism operated on the basis of longdistance trading; goods were exported from the home country to overseas markets with other goods then being imported back to the home market for sale. It provided a means for the holders of capital to invest their assets, at risk, for the opportunity of a profit. Mercantilist practices were generally rather intricately tied to national interests and a key concern was ensuring a balance-of-payments surplus (i.e., exports should be of a greater value overall than imports). The system reached its zenith in the eighteenth century at which time states were engaged in the practice of granting monopoly charters to companies, such as the British East India Company, removing the possible negative effect of domestically originating competition on profits in the process. In both this monopolistic practice and the state's economic intervention, mercantilism prefigured aspects of some modern capitalist forms.

Mercantilism in Britain led directly to the development of industrial capitalism during the nineteenth century as it helped to develop markets and increase consumption. Moreover, the preceding trading endeavors ensured an accumulation of capital seeking new investment opportunities that could be met by an increase in industrial production. New theories of political economy emerged, especially witnessed in the work of David Hume, Adam Smith, and David Ricardo, challenging the presumptions of mercantilism and favoring instead a view of economic progress founded upon free markets. Smith's thought in particular has had an enduring influence and his concepts of division of labor, the invisible hand of the market (self-regulation), and the benefits of competition and self-interest have been built

upon and refined by subsequent economists. Britain's early industrialization made it the workshop of the world, and it required both raw materials from abroad to fuel its production and overseas markets in which to sell its products. By the middle of the nineteenth century, Britain had embraced the free trade arguments of the so-called Manchester School of economics and ended almost all of its protective tariffs on imports. Other states began to industrialize, often with the aid of protectionist barriers, ultimately ending Britain's hegemony in the international economy and developing a global system of capitalist production assisted by imperial expansion. Imperialism was aided by the emergence of finance capitalism whereby capitalists sought returns from overseas investments rather than putting their money into domestic production. The creation of global flows of capital laid the groundwork for the globalized economy of the second half of the twentieth century.

Capitalism was not, however, a completely successful system. Rather, it was subject to periodic downturns in the trade cycle that led to unemployment as firms tried to constrain costs so as to improve declining profits or constrain losses. In an age before the advent of the welfare state, this practice often had disastrous consequences for members of the working class. The initial response to this plight came in the form of political ideas such as New Liberalism (or social liberalism) that sought to limit the negative excesses of capitalism upon the poor through a residual welfare state acting as a safety net. After the Great Depression, the largest and most significant crisis of capitalism, an entirely new macroeconomic model emerged based on the thought of John Maynard Keynes. Keynesian economics attempts to manage capitalism and stabilize the economic cycle, and it is often thought of as being hand-in-hand with a larger and more actively redistributive welfare state. The two need not be implemented together, however, although they can be complementary to one another.

Keynesian thought was the dominant force in mainstream economics between the end of World War II and the late 1970s. It was challenged by the stagflation (high unemployment coupled with high inflation) crisis of the 1970s and neoliberalism rose to the ascendancy. Neoliberals, following the lead of Friedman and Friedrich Hayek among others, favor free markets and laissez-faire capitalism on the basis that it promotes efficiency,

consumer choice, and lower prices. Such ideas gained currency in many Western governments during the 1980s, often leading to a rolling back of the welfare state and the privatization of nationalized industries to promote competition. It is worth noting, however, that the concept of free markets is not quite as its name implies, and most states have placed a great number of regulations upon economic activity for a variety of reasons, including the goal of preventing monopolies forming that could harm economic freedom and choice. The economic crisis that began in 2008 (often known as the Great Recession) led to a questioning of many of the suppositions of neoliberalism as well as a largely unheralded return of some Keynesian ideas.

The present stage of capitalism is often referred to as one of globalization in the international economy owing to the rise of multinational companies and more integrated global trade. Globalization is a much-debated term, however, although it is popularly used, and is an idea that is variously supported and opposed by different groups. Significantly, globalization suggests coherence to the evolution of capitalism and can be seen as part of a lineage that includes mercantilism, imperialism, and financial capitalism.

Political Ideology and Theories of Capitalism

Given its complexity and association with political ideas, it is unsurprising that a number of theories of capitalism have been developed. Of these, Marxism is perhaps the best known as a result of the ostensible adoption of its tenets in the Soviet Union. Marxism does not have a monopoly on anticapitalist thought, however, and there are conversely a number of theories that support capitalism as an economic system.

Marxism

Karl Marx developed his ideas on what he generally referred to as the “capitalist mode of production” over a great number of writings, many of which involved collaboration with Friedrich Engels. Marx saw history as a series of changes to the mode of production, which was defined by the relation of society and individuals to productive property. Capitalism is a

later stage in this history and distinguished itself from previous modes of production by having two large classes in clear and direct antagonism with one another, the bourgeoisie (owners of the means of production) and the workers. Capitalism allows the bourgeoisie to extract surplus value from workers via the sale of goods (i.e., workers are paid below the value of their labor input). This state of relations makes the workers dependent on continuing to sell their labor, as they are unable to afford independence and self-sustenance. Marx argued that this was unsustainable and felt that capitalism would eventually lead to the working classes attaining class consciousness and facilitating the revolutionary overthrow of the system to be replaced by a socialist mode of production.

Several thinkers have revised aspects of Marx's theory, often with a view to updating it in relation to subsequent developments in capitalism or to apply the theory to certain countries. For the most part, these revisions have left Marx's economic analysis relatively unchanged or else have departed from being identifiably Marxist. The most noted revisionist interpretations are Marxist-Leninism and Maoism, the latter of which still retains influence in the People's Republic of China despite that country's having embraced many aspects of market economics and state capitalism.

Joseph Schumpeter, a political conservative, agreed with Marx's view of capitalism's inevitable collapse and replacement by socialism, but did not think this would come about through revolution. Instead, he used the idea of creative destruction to explain capitalism's ever-changing nature while contending that the system would eventually become burdened with regulation and corporatism alongside an intellectual distaste for its negative effect on human well-being.

Liberalism

There is no single theory of capitalism associated with liberalism, as befits an ideology that is so diverse. Classical liberalism was associated with the classical economics of Smith, Hume, and Ricardo and their emphasis on laissez-faire and defense of private property. Similarly, contemporary mainstream liberalism is generally associated with neoclassical economics. One can also make a crude distinction between right liberalism (e.g.,

neoliberalism) and left liberalism (e.g., social liberalism) and the different economic theories underpinning them.

Neoliberals have tended to accentuate the thought of the Austrian and Chicago schools in particular. These schools argue that market capitalism is the only reasonable way to run an efficient economy and that economic planning is injurious to personal and political freedom. Although they favor deregulated labor markets, neoliberals tend to emphasize the need for regulation to ensure monopolistic practices do not emerge. Furthermore, neoliberalism holds self-interest and individualism to be the key motivators of economic progress and does not see this as opposed to universal improvement. Accordingly, neoliberals aim for minimal government intervention in the economy beyond the aforementioned regulation, and monetarism has tended to be their preferred macroeconomic policy.

Social liberalism, by contrast, is generally associated with Keynesian economics. Keynes agreed with other liberals and libertarians insofar as he felt capitalism was essential to maintaining political freedom, but he also felt that the economic system required management to maintain equilibrium and avert crisis. Keynes's interventionist policies require an expanded role for the state, and social liberals have tended to couple this view with a corresponding vision of a welfare state.

Social Democracy

Social democratic theories of capitalism tend to experience some overlap with either Marxian theories or social liberal theories. Three trends in particular have been prominent since 1945, the most left-wing of which has been support for a mixed economy, often predicated on the Nordic model. Most capitalist systems have some elements that are run by the state on pragmatic grounds (e.g., postal services, railways, telecommunications), but some social democrats argue that state monopolies should be used wherever the benefits of economies of scale would outweigh the benefits of choice from competing providers. Many mixed economy proponents also support Keynesian economics.

The second trend is the so-called social market economy. This model was pioneered in postwar Germany and attempts to maintain the free market as far as possible on the basis that it is the most efficient model, while seeking to ameliorate some of the negative effects it can have. It is therefore associated with economic regulation and the provision of social security.

The third strand of social democratic economic thought is the most recent and has considerable overlap with the second. Third Way thinking draws on a tradition of ethical socialism and social liberalism to adopt a centrist approach. It is positive about capitalism and tends to support the adoption of market approaches in public services to promote greater choice. Its most prominent adherents have been Tony Blair, Kevin Rudd, and Anthony Giddens.

Other

Fascists tend to be critical of capitalism on nationalist grounds, instead favoring corporatism and some nationalization. Green politics is concerned with sustainability and contends that capitalism in its current form is not ecologically sustainable. Green supporters, reflecting the diversity of the movement, have prescribed a wide variety of policies ranging from socialist-inspired to market-based solutions. Cooperativism seeks to create an alternate worker or consumer ownership model within the capitalist system and distributes a firm's profits depending on the input of such owners. Cooperatives are compatible with other ideologies and are often seen as a form of socialism. Conservatism has, in modern times, mostly embraced neoliberalism although earlier conservatives had advocated greater economic management and policies approaching mercantilism.

Carlyle, Thomas

Thomas Carlyle was born at Ecclefechan in Dumfriesshire, Scotland, in 1795 and died in the London suburb of Chelsea in 1881. Although Carlyle's social origins were humble—his father, originally a self-employed builder, farmed as a tenant on a modest scale—he received a good education, initially at a local high school and then at the University of Edinburgh. Having studied mathematics, philosophy, and classics in the arts program, Carlyle enrolled in the theology faculty in preparation for a career in the Church of Scotland. This career was his parents' preference but seems never to have appealed strongly to Carlyle; it became increasingly untenable as his suspicion of theological orthodoxy and clerical authority hardened. Having abandoned thoughts of the ministry by 1817 and after other false starts as a student of law and engineering, Carlyle embarked on a literary career, supporting himself in the meantime by private tutoring. Between 1820 and 1840, he rose from the ranks of anonymous writers of encyclopedia entries and reviews to a leading place on the national and international stage. His major political writings were published between 1830 to 1850, but reprints and collected editions extended their currency through to the end of the century. Thanks partly to these reprints, Carlyle's works attracted working-class readers as well as the upper- and middle-class audiences to whom they were originally addressed.

Carlyle never produced (or showed any interest in producing) a systematic philosophical treatise on politics. He was an author rather than a professional philosopher, reliant on the income from books and articles and

presenting his social and political ideas in many different forms. In the late 1820s and 1830s, Carlyle made a name for himself as a sympathetic critic and translator of recent German literature, but his essays on German romantic figures, and on Johann Wolfgang Goethe, were only part of an extensive range of writings on literary, topical, and historical themes. He went on to publish a quasi-autobiographical, pseudo-biographical novel, large-scale historical studies of the French Revolution and of Frederick the Great of Prussia, a heavily annotated edition of the letters and speeches of Oliver Cromwell, parables on a range of biographical and historical themes, and a number of highly charged polemical tracts.

Humanity's Mission and the Gospel of Labor

The historical cast of many of Carlyle's writings reflected his views on the correspondence between the institutions, practices, and conventions (forms) prevalent in particular times and places and timeless values embodied in various expressions of the spirit of religion. This spirit, necessarily tied in Carlyle's mind to humanity's imperative duty to bring productive order to a protean and often chaotic universe, was not the exclusive preserve of particular professions or creeds. The realization of humanity's mission depended ultimately on the moral authenticity of those who responded to what Carlyle called the gospel of labor. This idea played a central role in his political and social writings. The term *labor* embraced all forms of activity—artistic, economic, intellectual, literary, prophetic, social, and political—that contributed to humanity's mission and to modern Britain's critical role in it. Carlyle thought that the contemporary focus of this quest lay with industrialization and the diffusion of its fruits through colonization. His unqualified support for British imperialism, and the moral implications of his claims that slaves and former slaves in the United States and in the West Indies were unable to respond to the gospel of labor, offended liberal-minded contemporaries such as John Stuart Mill. Even when these ideas were censured, however, Carlyle's credibility remained largely intact.

Carlyle's views on race were expressed in intemperate language that became a hallmark of his later writings and the subject of ongoing critical comment. The *Latter-Day Pamphlets* (collected under this title in 1851, having debuted as a series of separate publications in 1850) were seen as

marking a watershed. Although Carlyle's earlier works were hardly exemplars of sweetness and light (and might not have been so popular if they were), his deployment of the agonized cadences of despairing prophecy became more marked as his celebrity grew. In *Latter-Day Pamphlets*, this voice conveyed stern exhortations to personal and social reformation, strident calls for action, and a renunciation of the culture of formalism and posturing that Carlyle associated with parliamentary government. Savage mockery of putative opponents, and condemnation of their propensity for willful self-deception, was interspersed with statements of seething despair that his calls would ever be heard.

In *Past and Present*, one of his most widely read works, Carlyle contrasted the spiritual calm of high medieval society with the superficially assured but radically unsettled self-consciousness of contemporary discourses of morality and politics. This state of mind was a symptom of fundamental dislocation, the sense of which compounded the impact of political and social conflict by undermining his contemporaries' spiritual confidence. Carlyle did not evoke medieval society out of a sense of nostalgia. Rather, the image of an integrated existence was meant to inspire his contemporaries to respond to challenges that emerged when the order that had satisfied medieval humanity was no longer viable. Carlyle believed that Martin Luther's rejection of papal authority was the first episode in an ongoing series of struggles between the impulses to reformation and counterreformation, revolution and restoration, godliness and enlightenment, and reform and reaction that had punctuated the history of modern Europe. These struggles were a consequence of attempts to forge an intellectual, moral, social, and political order that would capture the possibilities latent in an evolving sense of modernity.

Carlyle believed that the full range of these possibilities would only become apparent as humankind came to grips with them. The shape of the future was indeterminate because it depended on the energy and intelligence exhibited by those who responded to the gospel of labor. Their actions gave concrete expression to the universal obligation to recognize humanity's distinctive moral sensibility and to embed values that were commensurate with it in an integrated body of cultural, social, and political forms. Carlyle's conception of human order was emphatically hierarchical, but it

combined a strong sense of the intractability of intellectual inequality with a notion of moral egalitarianism. It meant that effective leadership rested on a widespread, though largely inchoate, appreciation that authentic elites gave practical shape to shared aspirations.

Although these aspirations were historically specific, they corresponded in some degree with what Carlyle took to be an irreducible human sensibility. His treatment of this idea was colored by his engagement with German romanticism and framed by his understanding of the religious dimensions of human experience. He argued that humans were both finite and infinite beings. Unavoidably rooted in the material world and subject to mechanical forces, as participants in the infinite they were necessarily engaged with the dynamic forces that were embodied in and expressed through, art, music, philosophy, and religion. Since the moral and spiritual basis of social and individual life was grounded in dynamic principles, human beings could not tolerate an existence that failed to recognize the infinite in man. While endorsing the role that mechanical forces played in transforming the productive capacities of Western European societies, Carlyle complained that the science of mechanics was increasingly treated as if it was capable of providing a complete basis for human life. The impact of this mode of thinking was apparent in the disordered condition of modern society and in the deep sense of disorientation that precipitated it.

The Condition of England Question

In *Chartism* (1839), Carlyle focused on manifestations of disorientation in the lives of members of the working class, framing them in terms of what he called the *condition of England question*. Although this question was an element in a European phenomenon, it was particularly important in Britain because the advanced state of industrialization meant that the risks and potentialities of modern culture were most apparent there. The experience of the working class was critical: this class bore the brunt of rapid industrial development and if goaded into insurrection, possessed the weight of numbers to destroy society. Carlyle treated Chartism as emblematic of a range of movements of popular protest and radical reform in contemporary Britain—the campaign for manhood suffrage, militant and conspiratorial trade unionism, machine breaking, rural unrest, and violent reactions to the

severe Poor Law regime introduced in 1834—which he attributed to the working class’s largely inarticulate sense that it was not being treated justly by the middle and upper classes.

In a number of respects, Carlyle’s attack on contemporary capitalism bore a strong family resemblance to earlier romantically framed critiques by Samuel Taylor Coleridge, Percy Bysshe Shelley, and Robert Southey and to more recent ones produced by the Young England faction in the Conservative Party. It also, however, incorporated perspectives on industrial society that gave it a distinctive cast. Carlyle thought industrialization was to be welcomed as providing the material and geopolitical basis for the next stage in humanity’s chaos-taming mission: that it might give rise to hardship was just another demonstration that suffering was an unavoidable feature of human life. At the same time, however, he argued that the undue preponderance of the mechanical spirit produced an intellectual and moral environment that turned these hardships into intolerable burdens. The enthusiastic adoption of the doctrine of *laissez-faire* was a particularly significant demonstration of this tendency.

Contemporary proponents of *laissez-faire* treated the free market as a model of utility-maximizing efficiency, and on this ground, sought to minimize the role of government in economy and society. Carlyle associated this position with a pervasive and morally insidious abnegation of social responsibility among the upper and middle classes generally, particularly employers of labor. In response to these perceived failings, he promoted the notion of “captains of industry,” a coinage that fused pioneering entrepreneurship with images of authoritative personal leadership and a strong sense of responsibility for the well-being of subordinates. Effective leadership was necessary to achieve what Carlyle, much inspired by the followers of Henri de Saint-Simon, termed the *organization of labor*. This objective, one that linked the working class’s need for employment and direction with humanity’s chaos-taming mission, stood in sharp contrast to the response to unemployment and pauperization reflected in the Poor Law Amendment Act of 1834.

Carlyle thought that this piece of legislation epitomized his contemporaries’ attachment to mechanical principles and demonstrated the full tragedy of

their impotence in the face of the challenges facing modern societies. Instead of promoting an intelligent response to unemployment and chronic poverty, which recognized the ethical significance of labor, the impact of uneven demand and market volatility, and the responsibility of employers and governors, the Act relied upon a simple and inhuman mechanism—the notorious workhouse test of less eligibility. This device was well suited to gauging the desperation of applicants for public support but was completely incapable of playing a role in the organization of labor. Carlyle did not regard the internal economy of the workhouse system as any more plausible. Paupers either languished in “sweltering idleness” or were engaged fitfully and ineffectually on make-work tasks that they knew to be a mockery of the gospel of labor. The practical futility of this approach was matched by its moral bankruptcy. It dehumanized struggling members of the working classes and sustained a public ethos that implied that those who had been thrown out of work by the invisible hand of the market were merely a public “nuisance” to be “upbraided” and “abated.” This was not, Carlyle observed, an “amiable faith.”

Although sharply critical of the doctrine of laissez-faire and of the implications of unbridled competition that he identified with it, Carlyle did not promote state or cooperative ownership of productive resources or question the need for private property. He often upbraided the upper classes for the use to which they put their property but never questioned their right to own and control it, nor did he regard property holders’ responsibilities as correlatives of their rights. Rather, his approach evoked a conception of human dignity that had strong romantic resonances infused with a lingering Calvinistic sense that suffering was unavoidable. It was also, however, governed by the idea of humanity’s mission and of the role of the gospel of labor in it. When these considerations were brought to bear on the legitimacy of private property holdings, they focused attention on the way in which property was used. The key issue was the organization of labor, not distributive justice or the rights of the working class to the products of its labor. Seen from this perspective, the duties of the property-holding classes were structurally identical with those of the working class. They were both expressions of a pure ethic that Carlyle presented in the form of the gospel of labor. This ethic required all members of society to commit themselves wholeheartedly to their roles in the state, society, and economy,

and it placed a premium on the quality of the output that resulted from their labors. The ethos of competitive capitalism compromised these values. It reduced the working class to a life of mere drudgery, undermined a commitment to honest production, and encouraged employers to view their workers as beasts of burden. Carlyle claimed that contemporary society inverted just order and systematically favored falsehood over truth. Laborers were engaged in sham labor, employers seemed committed to the disorganization of labor, and putative elites declined to provide political or social leadership. In *Latter-Day Pamphlets*, Carlyle extended his campaign to expose the worship of falsehood in art, celebrity, popular literature, and religious movements, providing a savage condemnation of contemporary culture and shrill warnings of the moral, spiritual, and practical perils that awaited a society that was so willfully indifferent to the claims of veracity and the duties that flowed from it.

In his economic and cultural criticism, Carlyle argued that his contemporaries had failed to come to terms with modernity in ways that met the requirements of humanity's indelible moral sensibility. Coining a phrase that was adapted by Karl Marx, he anticipated a condition where human relationships were reduced to a mere cash nexus. This chilling prospect arose because the principles of true morality were threatened by ideas associated with a conception of political economy that reduced human relations to market terms. While the working class suffered directly by exposure to the mechanical disciplines of the market, its reaction to them also unsettled the middle and upper classes, eroding their sense of material and spiritual well-being and throwing the community into endless crises. These developments mirrored the political and normative disintegration that had presaged large-scale revolutionary change in mid seventeenth-century England and late eighteenth-century France. Carlyle urged his readers to be sensitive to the fragility of social order and to appreciate the risk posed to it by the neglect of fundamental truths about the human condition. He underwrote this warning with a series of vivid demonstrations that the conduct and attitudes of the French elite had signaled its inability and unwillingness to come to grips with the challenges facing French society in the eighteenth century.

Authority, Leadership, and the Modern State

Carlyle's views on the viability of inherited systems of authority in contemporary Britain were as radical and emphatic as those that emerged from his study of French history. He was dismissive of the claims of the Church of England, and except on a few occasions later in his life when he was swayed by personal admiration, did not mourn the waning influence of aristocracy in British social and political life. He was particularly scathing in his condemnation of the Irish upper classes, presenting Ireland in the 1840s as a dystopian example of what England might become. Aristocratic and clerical authority was foremost among the dead forms that had been exposed in all their pathetic redundancy during the English and French Revolutions. But while Carlyle looked for an alternative to traditional forms of clerical, social, and political authority, he was adamant that it did not lay in middle-class conceptions of parliamentary government or in more radical democratic expressions of them.

Middle-class aspirations were tainted by their association with laissez-faire and with the narrowly materialistic connotations of contemporary free trade discourses. In addition, however, Carlyle identified middle-class reform programs with the triumph of parliamentarianism, an approach toward government that privileged forensic oratory and a blind adherence to arcane procedures over a commitment to purposeful action springing from insight into the real needs of the community. By contrast, effective leadership was informed by a sense of the realities underlying human life and took account of the dynamic forces that connected it with the infinite. The machinations of parliamentary parties and the posturing of stump orators were incompatible with these requirements and with the unself-conscious commitment to rectitude that was integral to them. As a result, Carlyle rejected the claims of those who thought that salvation lay in the refinement of parliamentary machinery and was scathingly dismissive of the leadership claims of the votaries of parliamentary government. In these circumstances, Carlyle argued, the working classes' demand for political rights was an understandable reaction to the leadership vacuum in modern culture. His response to this development emphasized elite failure rather than working-class presumption. He insisted that effective elite leadership was a necessary requirement of a well-ordered political community and that moves to promote democracy were incompatible with this requirement. Strictly speaking, democracy was really a system of nongovernment that

ignored the deeply ingrained sense that the wise had a responsibility to rule and that the rest of the population expected to obey them.

Carlyle's conception of political leadership rested on the assumption that while all human beings had a sense of their attachment to the infinite, only those with special gifts of character, intellect, and imagination were able to articulate this sense and give practical effect to it. These qualities distinguished heroic figures from ordinary mortals and provided the basis for hero worship. Heroic leadership called for insight, for moral and practical intelligence—the source of a sense of reality that is effective because it corresponds with significant truths—and for strength of character to overcome challenges that would necessarily arise in giving practical effect to these insights. Although heroic qualities might be displayed on the battlefield, Carlyle regarded military leadership as an occasional subset of political heroism not as a defining form of it. Nor did he see hero worship in terms of blind admiration or slavish obedience. Rather, it sprang from ordinary people's (generally inarticulate and often unconscious) insight into the character and mind of the hero and their appreciation that his (Carlyle's heroes are always male) utterances, and more particularly his actions, were directed toward the realization of objectives which they shared with him.

This idea of leadership was framed by an understanding of moral and political culture that related directly to Carlyle's critique of the science of mechanics. At the same time, however, his claims about the need to identify forms that were appropriate to a given culture meant that considerations of leadership needed to engage with institutional questions. Much of what Carlyle wrote on this theme was critical and largely negative and he generally declined to be drawn into advancing detailed statements on questions of policy or political practice. In *Latter-Day Pamphlets*, however, he not only presented a highly charged restatement of his oft-stated views on the failings of parliamentary government but also argued for an alternative to it. Carlyle's "New Downing Street" was presided over by a prime minister and cabinet that sat in parliament but were not answerable to it. These officials owed their appointment to the Crown and used parliament as a sounding board for policy that was to reflect their insight and expertise and to be free from the insidious influence of parliamentary inanities and stump oratory. As part of this process of genuine reform, Carlyle looked to

the chief governor of the New Downing Street to cleanse the Augean stable of British government, ridding it of its reliance on protocoling establishments and rescuing it from the labyrinth of red tape into which it had stumbled.

These prescriptions were framed by a conception of the state that made it the focal point of modern society: it was a “*luminous vitality* permeating with its light all provinces of our affairs” (Carlyle 1893, *Latter-Day Pamphlets, Works*, 84; emphasis added) and drawing on the heroic capacities found throughout contemporary society. This image endowed government with light and warmth and attributed these qualities to the interaction of an active and engaged population with leaders who responded to its needs and utilized its commitment and energy. On this account, heroic leadership complimented the agency of the community rather than displacing it. It might thus be seen as giving effect to aspirations that had been voiced by the German Romantic writers whom Carlyle had praised in his early writings. As with Friedrich Schlegel and Novalis, this vision of light, warmth, and energy was juxtaposed to counter images of cold, dead machinery that they associated with absolutism and Carlyle with contemporary reformers’ exclusive commitment to the science of mechanics.

Impact

Carlyle’s earliest essay in social and political thought (“Signs of the Times”) appeared in 1829 and the last (“Shooting Niagara: And After?”) in 1867. This period opened with the constitutional crisis precipitated by moves to admit Roman Catholics to active citizenship and closed with the popular agitation and political maneuvering that presaged a significant expansion of the male electorate by the parliamentary reform act of 1868. Each of these developments played a role in the works that spanned Carlyle’s career as a political writer, but typically he did not think that their true significance lay in their impact on the confessional or class composition of the British House of Commons. Rather, he thought that they were symptomatic of his contemporaries’ ongoing failure to come to grips with the challenges posed by modernity.

The interest generated by Carlyle's works in his lifetime and for decades after his death rested in part on a fascination with the earnest and evenhandedly radical personality that generations of readers thought lay behind them. He was seen as genuinely nonpartisan in relation to contemporary politics and not the spokesperson of any class or creed, an exemplar of authenticity who appealed to those promoting a wide range of agendas of moral, social, and political reform. These reactions to Carlyle persisted throughout his career and featured in obituary notices that flooded the press. If consideration is given to contemporary responses to Carlyle's substantive ideas, however, the position is more complex. In the 1830s and 1840s, his work attracted the attention of some conservative Anglicans and romantically inclined radicals like Mill who were alarmed at the spiritual malaise they discerned in modern society. Carlyle's increasingly emphatic rejection of traditional institutions, his open criticism of the upper classes, and his elevation of Cromwell as a hero, aroused suspicion among his conservative admirers. At the same time, however, it became apparent that he had no time for liberal radicalism of the kind associated with John Stuart Mill. This difference was partly a matter of personal temperament, but it also reflected substantive differences of outlook. Carlyle never accepted the modified utilitarianism that Mill espoused, he did not think that happiness was an appropriate or realistic goal for humankind, and he was dismissive of what he saw as Mill's roseate, weak-kneed progressivism. For Carlyle, hierarchy and subordination were permanent requirements of viable human order, not temporary features of an educational regime.

Carlyle's ideas were enthusiastically endorsed by John Ruskin. Both men abhorred liberalism and democratic politics and were hostile to the style of political economy that they identified with Mill. Ruskin's approach rested on a form of moral functionalism that was similar to that espoused by Carlyle in that it gave moral priority to labor. Ruskin, however, imbued the gospel of labor with aesthetic values that were not a feature of Carlyle's position but were connected to it through a shared commitment to an ideal of true labor. In this way, Carlyle's ideas fed into strands of late nineteenth-century socialism that stressed the material and moral dangers that competitive capitalism posed for the working class and for the ethos of society. As in other cases, the perception of Carlyle's radical sincerity was a significant aspect of his appeal, one that reflected the commitment to

fundamental social and political transformation found in the widely read socialist tracts of figures such as William Morris and Robert Blatchford.

Castoriadis, Cornelius

Cornelius Castoriadis (1922–97) was a Greek-French philosopher and psychoanalyst whose writings contributed crucially to the renewal of radical thought as the influence of Marxism waned from the 1960s onward. His range of interests and contributions was extraordinarily encompassing: he was equally comfortable writing about the philosophy and history of science, ontological questions, ancient Greek thought, modern phenomenology, structuralist anthropology and linguistics, the psychoanalytic tradition from Sigmund Freud to Jacques Lacan, and almost every aspect of political philosophy. His major work is *The Imaginary Institution of Society* ([1975] 2005), and many of his most important essays appear in a series of volumes translated and edited by David Ames Curtis.

Castoriadis was born of Greek parents in Constantinople, but his family moved to Athens while he was an infant. Castoriadis joined the Greek Communist Youth in the late 1930s. During the Nazi occupation of Greece, he was a student and a participant in clandestine Trotskyist cells. With the liberation of Greece, political instability led Castoriadis to move to Paris. There, his engagement with Trotskyists quickly led to disenchantment, and along with Claude Lefort, he created the group and journal *Socialisme ou Barbarie* in 1948. Castoriadis was the undisputed leader of the group and the most prolific contributor to the journal. For years, he worked days as an economist for the Organisation for Economic Cooperation and Development while evenings he wrote and participated in militant circles. His early articles attacked the Soviet Union for betraying the Marxian

legacy by developing into a highly organized and oppressive form of what he called bureaucratic capitalism. In opposition, Castoriadis identified the true content of socialism with the struggle of people to gain control over their activities. This redefinition of socialism as a fight for *autogestion* (self-management) would remain a key theme in Castoriadis's work, and it became influential among French leftists during the 1960s and 1970s. By the early 1960s, Castoriadis concluded that Marx's flawed economic theory, deterministic philosophy of history, and productivist orientation bore some of the blame for the twentieth century's derailed socialist experiment. Marxism, he concluded, now stood in the way of radical thought. The *Socialisme ou Barbarie* group broke up in the mid-1960s over the implications of this provocative conclusion. Castoriadis's prominence grew in the student uprising of 1968 when leading figures acknowledged his influence; and as many French leftists turned away from communism and Marxism in the 1970s, his thought found a wide audience. He became a practicing psychoanalyst, and in 1980, he was elected to the prestigious École des Hautes Études en Sciences Sociales, where he taught until his death.

Crucial to Castoriadis's attempt to reinvigorate radical thought was a vision of history that emphasized contingency, creativity, and the emergence of novel forms of social life. Inventiveness and creativity are key features of the human condition. Redefining revolutionary politics as the project of autonomy, Castoriadis affirmed a rigorous commitment to participation and collective deliberation. Taking the ancient democratic polis as an ideal, he championed direct democracy against all forms of representative government and bureaucratic management. Reminding his readers that the Greek root of autonomy is *auto nomos*, to give oneself a law, Castoriadis insisted that the indeterminate nature of history did not consign people to chaos but rather opened the possibility for the exercise of their own freedom.

One of Castoriadis's most distinctive contributions to social thought was his idea of the social imaginary. The social-historical world, he argued, is formed by the social imaginary, the creative power by which a society draws on reservoirs of significations and representations to institute itself as a specific mode of human coexistence. True to his emphasis on historical

contingency, he stressed that no model of causality or dialectical process can exhaustively explain the imaginative acts by which individuals and collectivities create meanings and materialize these meanings in institutions. Human existence is always self-creation, a ceaseless process of self-transforming human activity animated by the imagination, but self-creation has been typically concealed, covered over, assigned to a transcendent source, as in religion, or a deterministic process, as in Marxism. The project of autonomy, in Castoriadis's formulation, demands that human beings recognize themselves as the source of their own creation and adopt a freeing and interrogative attitude toward their individual lives and shared institutions.

Castro, Fidel

Fidel Castro Ruz (b. 1926), former president of Cuba, is the son of an immigrant from Galicia, Spain, who, after having been educated at the De Lasalle College at Santiago de Cuba, later by Jesuits at the Colegio Dolores in the same city and at the Colegio de Belén in Havana, graduated from the University of Havana as a lawyer and went on to become the charismatic architect of a revolution that overthrew the dictatorial regime of Fulgencio Batista and established a socialist state. As president of Cuba, Fidel held on to power until February 2008, when the presidential reins were handed to his brother, Raúl Castro.

While a student at school and university, Castro excelled at sports but was also involved in political activism, often in support of the Orthodox Party led by Eduardo Chibás. The situation was volatile. Murders occurred, and student gangs played a prominent part. In 1947, Castro participated in a failed expedition to overthrow the Dominican Republic dictator, Rafael Leonidas Trujillo Molina. Cuba at that time was very much a U.S. playground and well known for involvement with Mafia interests. Castro soon endeavored to change the status quo represented by the corrupt and repressive regime of dictator Batista, who had assumed control of the government following a military coup in 1952. Together with others, including his brother Raúl, Castro staged an abortive attack on the Moncada Barracks in Santiago de Cuba with a view to paving the way for a revolution. The date was July 26th, 1953, which was to become a momentous one; Castro would insist on its being identified as the start of

the Cuban revolution. The attack floundered, and Castro, together with many others, was rounded up and arrested. Although some of his comrades were executed, Castro sentenced to fifteen years. While in prison, Castro reconstructed the defense he had presented at trial, and it was published as a tract titled “History Will Absolve Me,” which was widely circulated throughout Cuba. He read voraciously and helped set up a prison school.

Castro was released in 1955 as a result of an amnesty and eventually went to Mexico, where he met the Argentinean doctor turned revolutionary, Ernesto “Che” Guevara. A number of potential revolutionaries from Cuba and elsewhere joined Castro’s clandestine movement—the 26th July Movement—and a group of about eighty-two landed in Cuba on December 2, 1956. They were dispersed by the enemy, and afterward, only eleven remained. They retreated to the Sierra Maestre, where more locals joined their ranks. Following the eventual capture of several localities, Castro and his followers marched on Havana on January 8, 1959. By then, Batista had been forced into exile. Castro was first appointed Commander of the Armed Forces and later prime minister. Agrarian reform was implemented, characterized by the breaking up of large landholdings and their redistribution among peasants, some of whom were organized into cooperatives.

In 1960, Castro signed a trade agreement with the Soviet Union and nationalized several U.S. oil refineries in Cuba, after which the United States instituted a series of sanctions. In January 1961 the United States broke diplomatic relations with Cuba and, through the U.S. Central Intelligence Agency, planned an invasion of Cuba, which would eventuate in the disastrous Bay of Pigs operation in April of that year. Although Castro had a stormy relationship with the Catholic Church, relations with the Vatican had thawed significantly toward the end of the 1990s when Pope John Paul II visited the country. Despite all the economic difficulties, Cuba under Castro made tremendous strides forward in education, medicine, science, sport, international exchange relations, and sustainable development.

Cuba today places its educational and medical facilities at the service of not only its own people and celebrities, but also the common people of Africa,

Asia, and many other parts of the world. As part of its revolutionary commitment to international cooperation, Cuba makes the products of these institutions (teachers, health workers, doctors) available for export against token fees, depending on the receiving country's ability to pay. There has emerged a series of bilateral, trilateral, or multilateral agreements generated by these forms of collaboration with other countries, within the context of South-to-South cooperation in which developing countries exchange and share resources, technology, and knowledge to support sustainable development.

Like Nicaragua later, Cuba was forced to contend with overwhelming obstacles in its efforts to serve as a revolutionary model to other countries within the U.S. intercontinental sphere of influence in the Americas. Despite sordid moments, the Cuban revolution hoped to evolve into an alternative political economic structure in contestation to the Capitalist West, the latter denounced for the exploitative nature of the economic and social relations it promotes.

There have been notable achievements in the areas of preventive health, sports, international exchanges, sustainable development, and science. As with all societies, there are perennial issues of concern, such as those of control over departure and return of Cuban nationals, the often expressed feelings, by visitors, of a sense of repression, the reemergence of prostitution, the adoption of a different price structure for foreigners and locals, and the historical amnesia among present-day younger Cuban citizens with respect to knowledge of life in Cuba prior to the revolution. There is also the persistent major problem of the U.S. blockade, denounced by several dignitaries.

Cuban health and educational systems are the envy of many nations, and the University of Havana medical school is considered among the best in the world.

According to the 2006 World Wildlife Federation Living Planet report, Cuba is the only country in the world with sustainable development. As noted by John Bachtell (2009), it combines high human development standards (high literacy and health indexes) with a low ecological footprint; this footprint includes the rate of electricity consumed and carbon dioxide

emitted per capita. In making use of old cars and other products that are made to function thanks to some superb mechanics and technicians, Castro's Cuba has militated against the prevalent consumer culture ideology of obsolescence with its devastating planetary effects.

Great poverty exists. Prostitution, for example, that very same social predicament of exploited poor women and adolescent girls initially tackled head on by the revolutionary government through educational and rehabilitation measures such as schools for prostitutes, is on the rise once again, especially in tourist areas (similar to other countries), despite its illegality. Cuba operates a strict policy of control over departures and arrivals of citizens from abroad. It is often argued that this policy needs to be revised, given that the situation has dramatically changed since the early days of the revolution when Cuba lost a huge percentage of its brainpower, in terms of doctors and other professionals, to the United States. If anything, the small nation now proactively exports such power. There is also an overproduction of qualified people without reciprocal economic investments to integrate them. It has been argued that one should not blame this problem solely on the infamous blockade, which in the view of many, has no justification today (if ever), now that the former Soviet Union's threat to the United States no longer exists.

Castro's political opinions commenced with an anti-imperialist outlook that developed toward socialism after his role in the Dominican uprising of 1947. Between 1948 and 1950, his ideas developed towards Marxism, though his principal goal remained Cuban national independence, and an astute balance between nationalism and Marxist internationalism would characterize most of his mature policies. His famous courtroom speech "History Will Absolve Me" (16 October 1953) was radical rather than socialist, its chief pleas being for land reform and a sharing of industrial and agricultural profits. Agrarian reform indeed became one of Castro's first measures after the 1959 revolution. Cuba was pronounced a socialist country in 1961, and for the next forty years, despite some disagreements with the USSR, the Soviet model would dominate Castro's theory and his practical political measures. All private enterprises were finally banned in 1968, though in the early 1990s and again more recently free market initiatives have begun anew. Abroad, Castro focused support on national

liberation movements of various kinds in Latin and South America and Africa in particular.

Chartism

Chartism

Chartism

Chartism can plausibly be characterized as Britain's first civil rights movement. It took its name from *The People's Charter* (May 1838), a proposal for political reform presented as a draft parliamentary bill, prepared by William Lovett for the London Working Men's Association. It contained nothing new of any substance, save for a frontispiece of a polling station and voting machine. However, it quickly achieved prominence as the defining statement for democratic reform at a time of burgeoning social and political unrest and by early 1839 had given its name to the mass movement that dominated British domestic politics until 1848. Designed to complete the process of reform begun by the Magna Carta (1215), the Charter's six key demands had been a commonplace of radical discourse since the 1770s: universal male suffrage, a salary for every member of Parliament (MP), no property qualification for MPs, election by secret ballot, equal sizing of constituencies, and annual parliaments. The latter signaled an intention to make parliamentary democracy as participative as possible.

As a political movement, Chartism was most potent during three downturns in the trade cycle, 1838 to 1840, 1842, and 1848. In 1838 to 1839, Chartism mobilized significant cross-class support and middle-class delegates were notable within its National Convention, elected in February 1839. However, the readiness of many delegates to countenance using force, if peaceable agitation failed, meant Chartism swiftly hemorrhaged polite supporters: by the summer it had assumed the character for which it is generally

remembered (and was celebrated by the young Karl Marx), that of a mass movement of industrial workers. Under the leadership of the National Charter Association (NCA—formed 1840), and galvanized by renewed economic depression, 3.3 million people signed Chartism's 1842 petition. This petition argued passionately not only for the Charter alone, but also for reduced working hours, Poor Law reform, the independence of Ireland under the British crown, the disestablishment of the Church of England, and economies in the cost of the monarchy and military. The petition text also complained of "a host of other evils, too numerous to mention, all arising from class legislation." As the gulf separating Chartism from middle-class opinion widened, the Charter was taken up with unprecedented vigor by organized trades, leading to an almost general strike in northern England in the late summer of 1842.

Chartism never regained that level of potency, though in 1848 for the first time it mobilized mass support in London, to the considerable alarm of a government mindful of revolution abroad. Resolute policing combined with misjudgments by the Chartist leadership (inspired by events in Paris, the submission of another mass petition was brought forward before the movement nationally was fully prepared) to send Chartism into a slow spiral of decline. Its active membership dwindling, the NCA was beset by infighting. By 1851, it was little more than a pressure group, now advocating an extensive social democratic program as well as the Charter. Largely unnoticed, the last Chartist National Convention was held in 1858. Yet the 1850s also saw a proliferation of Chartists serving on local government bodies (the first had been elected as early as 1841).

Though it has consistently been viewed as a benchmark agitation in British political history, opinions about Chartism have varied widely. During the second half of the nineteenth century, frustration at its failure was largely channeled into criticism of its leaders, especially the charismatic Feargus O'Connor who dominated the movement after 1839. By 1918, opinion had hardened, excoriating the rapid marginalization of Lovett, apparently at O'Connor's hands. Yet Lovett lacked the vital skills for platform agitation (that O'Connor had in abundance). Furthermore, the contrast between the two was largely the historiographical contrivance of Fabian authors, overlooking the extent to which all working-class Chartists, Lovett

included, subscribed to the slogan “peacefully if we may, forcibly if we must,” in 1838 to 1839. Similarly contrived was the interpretation of Chartism as a fully class-conscious proletarian movement. This interpretation obscured the renewed vitality it gave to the long-established radical assault on aristocratic corruption and was the target of Gareth Stedman Jones’s influential 1983 essay “Rethinking Chartism.” It also failed to comprehend or explain the extent to which those who had called themselves Chartists subsequently reached an accommodation with liberalism. Since the 1980s, the political complexity of Chartism has been more generally acknowledged, the endurance of Chartist ideals appreciated, and O’Connor’s reputation largely rehabilitated. The rich diversity of its cultural manifestations (especially poetry and its periodical press) is also increasingly recognized.

Chinese Cultural Revolution

Chinese Cultural Revolution

Some view history in terms of specific events, however misunderstood; some view it as a progressive evolution, however painful; and still others see it as one ever-expanding catastrophe. China's Great Proletarian Cultural Revolution (CR) is susceptible to all three views. Commonly described as being in its first and last instance a scheme aimed at restoring and sustaining Mao Zedong's preeminence as China's paramount leader following his disastrous Great Leap Forward policies (1958–61), its targets were feudal, capitalist, and revisionist counterrevolutionary elements in the party and state apparatuses as well as society at large. Many then and now view the CR as the damning conclusion of Maoism and a complete unmasking of a self-aggrandizing, suppressive, and exploitative tyranny at the heart of Mao Zedong Thought, if not the Communist Party of China (CPC) as a whole, while others view it positively, and even nostalgically.

Historical Context

Initiated with Mao's blessing in 1966 and propelled in a quasi-religious fervor by paramilitary units composed primarily of youths known as the Red Guards, most record the CR as culminating with Mao's death in 1976. Others believe CR-related policies were still operative in many senses as Mao's immediate successor, Hua Guofeng, attempted to form a new cult of personality while leading the nation anew in studying Mao Zedong Thought—efforts that had failed largely by 1978, and certainly by 1980, when Hua

was demoted. Nevertheless, Hua is given credit for overthrowing the Gang of Four—a pro-CR leadership faction led by Mao’s powerful but estranged wife, Jiang Qing—shortly after Mao’s death and for marginalizing others deemed extremist, and thus, some credit Hua with ending it. Mao ordered the Red Guards suppressed in 1967 and claimed the CR over in 1969, although many of its policies were still in place in 1971, when a failed coup against Mao resulted in Lin Biao’s fall (then Mao’s designated successor and one of the CR’s chief architects). While it is reasonable to say the CR lasted from 1966 to 1976, it is also reasonable to view it as different if not contradictory stages that are difficult to label as a whole.

The CR emerged from many earlier experiences, including the Chinese Civil War (1927–50), China’s early and stunning political and economic successes (1949–58), and especially the Great Leap debacle that followed. The CR has especially deep roots in the shifting development of Mao’s thinking as a whole, reflecting his own ever-changing historical vision. Many trace the CR’s impetus specifically to the CPC’s Lushan Conference (1959) when criticisms of the Great Leap policies began in earnest, ostensibly by then Defense Minister Peng Dehuai. These criticisms ultimately culminated in Mao’s temporary political retreat—which began, actually, with Peng’s dismissal and his replacement with Lin Biao, who would in turn pave the way for Mao’s return via the CR. In fact, much of what is generally associated with the CR, from mass rallies to the propagation of the *Quotations from Chairman Mao* ([1964] 1967, the “Little Red Book”) and study groups were modeled on similar practices underway in the armed forces per Lin’s direction by 1963.

The CR should also be viewed in tandem with the Sino-Soviet split (1959–89), as well as the ongoing international struggles of the Cold War, and perhaps even various movements elsewhere for liberation, including struggles for independence throughout the developing world, particularly during the 1960s. It is not far-fetched to associate the CR with progressive-oriented movements in the West, including the student revolt in Paris in 1968, as well as with other efforts to broaden rights and political participation for the poor, for women, and for minorities. Conversely, some associate it negatively with the Soviet suppression of Czechoslovakia’s Prague Spring, also in 1968.

Consequences

A simple summary of the CR is nearly impossible, in part due to its complexity and in part because its study and discussion remain restricted in China itself. With scant reliable information, official or otherwise, many histories are little more than piecemeal guesswork while others skew polemically, often based on strongly biased and even fabricated accounts. Among anti-Maoists in and outside China, the CR is a favorite target for criticism, one that is generally assessed as the definitive statement of Maoism and as being on par with the worst excesses of Stalinism and Nazism. Both China's post-Mao, reform-era regime (1978–present) and reputable Western-based scholars have viewed the CR as a political and economic catastrophe of epic proportions, blaming it for tremendous losses to life, property and opportunity. Estimates of lives lost range from tens of thousands (derived indirectly from official accounts) to more than twenty million with scores more injured, although these low and high ends probably indicate gross under- and overestimations. However, a small but increasing number of Western and Chinese scholars have begun reevaluating the CR as well as its political, economic, and cultural consequences in more positive terms, although doing so remains deeply controversial if not taboo nearly everywhere.

One of the CR's primary focal points was a cult of personality centered on Mao and based on the Party's official adherence to Mao Zedong Thought, as well as the Party's military-oriented political culture, which made it and the nation susceptible to top-down campaigns. That said, several key factors led to the CR specifically. As already noted, one factor relates to Mao being sidelined after the Great Leap, though nominally still party chairman. Another relates to Mao's concern that Liu Shaoqi and Deng Xiaoping (who assumed leadership of the party-state in the Great Leap's wake) were implementing capitalist-leaning policies. These developments, along with China's increasing bureaucratism and Soviet revisionism, led Mao to conclude that China's socialist gains were threatened. Thus, the CR provided an opportunity for purging political enemies—Mao's own unambiguous “big character poster” at the start of the CR read, “Bombard the Headquarters.” However, it also opened the door to political wrangling by those trying to influence policy making and vying to be Mao's

successor, including Lin Biao, the Gang of Four, and others, especially during Mao's sharp physical decline in the 1970s.

Ultimately, while the CR achieved some of Mao's goals, including purging Liu and Deng (the latter survived, the former did not) and reconsolidating Mao's dominant position, the CR proved impossible to sustain. Economic production was hindered, schools and universities were completely disrupted, and warring factions took to the streets. As it unfolded, Mao expressed surprise at its intensity, but decided to let it run its course, as he said, to expose social and political contradictions and to provide a necessary vent for them. After the movement became too unwieldy, many would be sent "Down to the Countryside" to "learn from the peasants," a policy used in part for a new round of political indoctrination and as a means for reestablishing stability by emptying the cities of radicalized leftists and intransigent rightists and others. While most scorned being sent down then and now, many, including the peasants who received them, view those experiences as constituting an informative coming-of-age that helped prepare China for challenges to come.

Legacy

It is relatively common to see the CR referred to as Mao's last revolution. This is arguably true in a strictly temporal sense, coming as it did in the final years of his life. It also is sometimes assessed as noted above as the culminating if not definitive statement of Maoism or Mao Zedong Thought in theoretical terms, as Maoism's last gasp before the movement exhausted itself and was supplanted by Deng Xiaoping Theory and reform and opening up, and/or as Mao's final solution when it became clear that previous efforts to reach communism in the near term had come up short. Each of these views is problematic.

Although the CR was among the last major movements in Mao's life, there were others that can and perhaps should be viewed separately and not as constitutive elements of the CR itself. For example, Mao asserted that the CR had come to an end in 1969, and by then, efforts to open up to the West were already well underway, efforts that would lay the groundwork for the reform and opening up period that followed his death. Further, Mao

intentionally did much to mitigate if not reverse the CR, even describing himself as the “black-hand counterrevolutionary” as he chided warring Red Guard factions who were accusing each other of the same. Further, there is significant evidence showing that while Mao was indeed the CR’s dominant instigator, his role was more reactionary and likely smaller than is generally perceived.

At the same time, the CR is broadly consistent with Mao’s theory of revolution, which has sometimes been viewed mistakenly as being similar to Leon Trotsky’s notion of permanent revolution. In fact, Mao held that Marxism had two swords, which he described nominally as Leninism and Stalinism. In his view, the sword of Leninism provided a basis for mobilizing the masses against barriers to progress, while Stalinism provided a means for consolidating revolutionary gains. However, a permanent revolution in the vein of Leninism was too chaotic and exhausting to maintain over a long period of time and indeed was better suited to tearing down institutions than building them up. On the other hand, unchecked Stalinism led to Thermidorian bureaucratism, often becoming a staunch barrier to progress and much worse, of course. By 1956, Mao believed the USSR had lost both swords, insomuch as Joseph Stalin had suppressed the revolutionary character of Leninism while Nikita Khrushchev initiated de-Stalinization. Contrarily, Mao believed in a dialectic of progress where tearing down and building up must follow each other periodically. He argued that many similar revolutions would be required in the future as society advanced in fits and starts and predicted his CR might buy China a decade before some new effort would be required to stymie a new round of counterrevolutionary backsliding. In this sense, one might view the CR as a revolutionary phase within a longer revolutionary movement.

The CR has sometimes been viewed as an attempt to realize what Mao once referred to as “politics in command”—that is, as being driven primarily by revolutionary politics in lieu of being led by more conservative economic approaches. Analyses like these point to the CR as the sort of disaster that can result from such thinking. As a corollary, some also point to the post-Maoist reform and opening up period as economics in command, which initially neglected politics and resulted in its own tragedy in 1989. Such thinking is probably too simplistic. Nevertheless, the importance of

balancing both economic and political reforms, however poorly realized in actual practice, is one of the primary lessons drawn by the Party since 1989.

Some believe the CR was conceived in part as an attempt to bring social justice to China's poor and disenfranchised. Mao's concept of the Mass Line ("from the masses, to the masses"), along with his promise to bring big democracy to the masses, are consistent with stated CR goals, although both were always manipulated and then suppressed extensively by 1968.

Nevertheless, there is a growing body of literature that argues that the CR brought significant gains to workers and peasants, as well as to women, though many likewise argue those gains were largely reversed after Mao's death with reform and opening up. However, many minorities were targeted during the CR because Red Guards sometimes saw them as being backward if not separatist (a view that was not held officially by Mao or the Party itself).

One curious footnote is that although the CR was launched in part as a response to a growing U.S.- Soviet détente, the same would prompt China to initiate its own contacts with the United States in the late 1960s, with visits to Beijing by Henry Kissinger and Richard Nixon in the early 1970s. At the same time, this tension with the Soviets led China to support Cambodia's Khmer Rouge against Vietnam, then a Soviet ally, and even inspired Cambodia's own disastrous cultural revolution in the early to mid-1970s, despite the fact that China had largely moved past such thinking for itself.

The CR remains a major touchstone for many, and its legacy still influences politics and policy making. Many, even those born as late as the early 1970s, have direct memories of the CR. In its aftermath, term and age limits were implemented, as well as other reforms aimed at promoting the rule of law and preventing extremism and personality cults. However, many on the left believe Mao's suspicions of Deng and Liu proved well founded and judge Deng's reform and opening up as a return to levels of corruption, exploitation, and inequality unseen since 1949.

Chinese Marxism

Marxism came to China early in the twentieth century. Offering new approaches to concrete social and political problems, it would become the dominant strain of political thought. Marxist theories and active politics in China were intimately connected and over the long century of revolution, had a deep and continuing impact on the lives of hundreds of millions of people.

Early Developments

In the context of radical questioning of traditional thought and political revolution against the Qing dynasty (1644–1911), Marxist ideas were among an array of socialist theories introduced to China through Japan in the first decade of the century. Compared with anarchist thinkers such as Peter Kropotkin (1842–1921) and Michael Bakunin (1814–76), Karl Marx had little early appeal. While radical intellectuals found Marx's socialist goals attractive, China's relative lack of industry and a working class made Marxism appear unrelated to China's immediate problems.

It was the 1917 Bolshevik Revolution in Russia, like China an agrarian, historically monarchical society, that made Marxism relevant. But it was not until two years later when the West granted Germany's Chinese colonial holdings to Japan at the end of World War I, that disillusionment with Western liberalism and a burst of political engagement in the 1919 May

Fourth Movement prompted Chinese intellectuals to take to Marxism in earnest. Li Dazhao (1888–1927) was the first to respond to the Russian Revolution and then to study seriously its underlying theory, publishing “My Marxist Views” by early 1919.

Early Marxists were immediately involved in urban labor organizing. Lacking background in social democratic thought, they were drawn to those aspects of Marxism, such as class struggle, that provided a basis for revolutionary action rather than to Karl Kautsky’s reformist version of Marxism. The materialist conception of history built on an earlier attraction to Social Darwinism and on a traditional Chinese concern with social conditions. Vladimir Illyich Lenin’s conception of a vanguard party provided the vehicle for immediate action, and his theory of imperialism gave China a place in world revolution. Young Chinese Marxists began with the ideas of late Marxism.

Chen Duxiu (1879–1942) and Li Dazhao, who had been his colleague at Beijing University, together formed the Chinese Communist Party in 1921. Two years later, under the guidance of the Comintern (the Communist International, 1919–43), the fledgling party allied with Sun Yat-sen’s larger Nationalist Party, heir to the 1911 Revolution and also by 1923 a Leninist organization. Marxism for now came largely filtered through Russian sources, and Qu Qiubai (1899–1935) introduced dialectical materialism as a universal interpretation of all phenomena, displacing the earlier historical materialism with its focus on concrete historical processes. While there would be little development of theory independent of practical politics, Marxism would spur significant new directions in historical and sociological research and literature.

Mao Zedong, the Great Leap Forward, and the Cultural Revolution

In 1927, politics again shaped theory after Chiang Kai-shek led the Nationalists to turn on the Communists, crushing the growing labor movement. Driven underground in the cities, a remnant of the Party reestablished itself in the countryside. There, Mao Zedong (1893–1976)

emerged dominant both politically and in the realm of theory. Two decades of warfare and a strategy of forming rural bases in the context of a peasant movement provided the grounding for new directions in Marxism. Much of Mao's prestige as a theoretician grew from his military successes, and his analysis of concrete military situations fed into a philosophical dialectical materialism. As was already evident in his "Report on an Investigation of the Hunan Peasant Movement" (1927) and echoing strains in Li Dazhao reminiscent of the Russian Narodniks, Mao located the potential for revolution in the peasantry. He was suspicious of cities and looked to bypass the development of capitalism. Mao's dialectical thinking and populism combined with voluntarism, a stress on the active will.

During the relative isolation of the Yan'an period (1936–48), with the time to read Marx and Lenin, Mao wrote "On Practice" and "On Contradiction" (1937). While these essays were the basis for Mao's claim to be a major Marxist theoretician, Mao's dialectics, populism, and voluntarism marked a divergence from Marx, and these characteristics of his thought would reemerge after the communist victory in 1949.

Initial successes in the 1950s in establishing a new state and political economy lent confidence to Maoists, while fear that history could turn backward accentuated the urgency of uninterrupted revolution. The year 1957, which saw Mao's "On the Correct Handling of Contradictions among the People," was a turning point. Rejecting the Soviet model, China embarked on the disasters of the Great Leap Forward (1958–60), a utopian drive for grassroots industrialization, and the Great Proletarian Cultural Revolution (1966–69/76), a chaotic, often violent mass movement launched in an attempt to reignite revolutionary spirit, confront contradictions with the vanguard party itself, and create a new man.

Chinese Marxist Thought After Mao

In the years since Mao's death in 1976, the Communist Party initiated the current period of reform and opening to the outside world. Official ideology has sought to bolster the legitimacy of the state with a ritualized Marxism immersed in practical developmentalism and nationalism. In an increasingly

diverse intellectual realm, there have been a series of creative attempts to revisit and develop Marx's thought.

The roots of new approaches lay in Cultural Revolution experiences, and in 1974, a group of young Red Guards wrote "On Socialist Democracy and the Legal System." Wang Xizhe (b. 1949), one of this group, was active in the Democracy Wall movement of 1979 between periods of imprisonment. Drawing directly on Marxist classics rather than later interpretations, Wang argued that Mao's mistakes grew from skipping over necessary historical stages of development. While still envisioning Party leadership, he began to write of Marx's concepts of alienation and human liberation with such articles as "The Dictatorship of the Proletariat Is a Humanitarian Dictatorship" (1980). Themes of humanism, democracy, the rule of law, and problems of development would run through the post-Mao period.

In reaction to the trauma of the Cultural Revolution, the 1980s brought a burst of new ideas, a New Enlightenment movement, and an attempt to restore Marxist universal values to Chinese socialism after the mistakes of Maoism. Reading György Lukács, Antonio Gramsci, Leszek Kolakowski, and the Frankfurt school and looking to the experiences of European social democracies, older intellectuals within the political establishment reached back to the early Marx of the *Economic and Philosophic Manuscripts of 1844* to argue for Marxist humanism in support of reforms. Wang Ruoshui (1926–2002), then an editor of the party newspaper, *People's Daily*, criticized Stalinism and Maoism in "Man Is the Starting Point of Marxism" (1981). Chinese socialism had suppressed individuality, taking people as means rather than ends, where a humanistic Marxism would overcome alienation, treating human desires in individual, rather than class or national, terms. Su Shaozhi (b. 1922), for a time director of the Institute of Marxism-Leninism-Mao Zedong Thought, Chinese Academy of Social Sciences, saw Marxism as in crisis in China and called for its thorough rethinking, a rejection of those elements that were no longer useful, and the integration of Marx's basic principles with Chinese reality. He argued that China's economy was still in the primary stage of socialism requiring mixed ownership, that the Party itself needed democratic reform. Su advocated for formal institutions of a people's democracy and concurred with Wang Ruoshui that humanism was at the heart of socialism.

While intellectuals such as Su Shaozhi and Wang Ruoshui argued from within Marxism and the establishment and others rejected Marxism altogether, the most influential thinker of the New Enlightenment is harder to categorize. Professor and Senior Research Fellow at the Chinese Academy of Social Sciences' Institute of Philosophy, Li Zehou (b. 1930) has drawn on Marx, Immanuel Kant, and Chinese traditional thought to develop a creative and comprehensive philosophy that reaches beyond the eighties and the Chinese context. Li Zehou holds that, although they played a positive role in the context of the 1980s, New Enlightenment thinkers were wrong to interpret Marxism as humanism. An emphasis on the individual alone is theoretically empty, unable to analyze history or the relation of individual and society. Marxism, Li Zehou argues, resonating with the earliest Chinese Marxists, is fundamentally a theory of history.

Returning to early Marx and the *Economic and Philosophic Manuscripts of 1844*, Li Zehou finds that both later Marx and Marxists neglected his early ideas in their turn toward political action and revolution. Rather than Marxism as a theory of revolution or of criticism, Li Zehou takes up Marx's idea of humanized nature to philosophize the ongoing construction of human capacities of subjectivity and civilization grounded in historical materialism. To Marx's focus on the humanization of external nature and the creation of a technological-social structure, Li Zehou adds the building up of the internal nature of human beings for humankind through history and for individuals through education broadly understood. Through the making and use of tools over millions of years, human animals become rational animals with reason's categories of understanding, human emotions and ethics, and aesthetic feeling. The sedimentation, over history and through experience, of rationality within sensuality continuously forms a cultural-psychological structure of human subjectivity. In contrast to Mao's voluntarism, Li Zehou sees humans and nature as mutually entailed. Where a deterministic understanding of Marxist materialism takes the mind as a mirror, for Li Zehou the mind is an active subject. Li Zehou's philosophy looks to the creative activity of subjectivity in and through history. In doing so, it accounts simultaneously both for human capacities, human nature, in general, and for the unique meaning of individual lives.

After the violent suppression of the Democracy Movement in 1989, a new period of rapid economic growth and commercialization saw the professionalization of a new generation of intellectuals within academic institutions. Their pursuits became widely diverse and interconnected with those of intellectuals around the world. By the late 1990s, a new trend, dubbed the New Left, emerged in reaction now not to a crisis in Marxism consequent on the Cultural Revolution but to the complex social, economic, and political context of growing inequalities attendant on the rise of a market economy.

Even before the use of the term *New Left*, Cui Zhiyuan (b. 1963), then at Massachusetts Institute of Technology in the United States and now a professor at Tsinghua University, published “Institutional Innovation and a Second Liberation of Thought” in 1994. Using Western theories of neoevolutionism, analytical Marxism, and critical legal studies, Cui called for liberation from the dogmas of liberalism and the market. Instead, he advocated reconsidering what is useful of China’s experience combined with the market to create innovative institutions addressing concrete problems in contemporary China. Without worrying about a definition of capitalism, Cui has been particularly interested in new forms of property rights and the possibilities of ownership as a bundle of different rights. He has studied the emergence of rural collective enterprises, seeing them as rooted in traditional forms of voluntary cooperation neither socialist nor capitalist and detecting the opportunity for a form of rural enterprise-led modernity. Cui was also an early supporter of the Chongqing model, which emphasized local political and social experimentation in pursuit of equality and common prosperity, in the capital of Sichuan Province before it was discredited in a massive corruption scandal in 2012. Cui wants to reduce the urban-rural gap, promote sustainable growth, and use public ownership and state planning to stimulate the private market, a sort of liberal socialism.

Concerns of Cui and others coalesced as a trend by 1996, and in 1997, a professor at Tsinghua University, Wang Hui (b. 1959) published what has been taken as the New Left’s manifesto, “Contemporary Chinese Thought and the Question of Modernity.” A review of intellectual trends since the beginning of the reform era, Wang’s article saw all theories, Marxist and non-Marxist, converging into global capitalism and implicated in the same

problem of modernity. Wang calls attention to the interweaving of issues of cultural, economic, and political democracy in the complexity of contemporary society. Rather than looking for a single grand theory, Wang calls for the transcendence of binaries and the confrontation of China's huge social inequities with concrete analyses and innovative approaches and institutions.

As intellectual debates continue in the face of growing social injustice and corruption, it is increasingly difficult to differentiate clearly among schools of thought, in particular between a New Left and liberalism. Beyond this debate, other voices, such as that of Lin Chun at the London School of Economics and Political Science, recover positive elements within a critical reassessment of the experience of socialism in China. Working from an early interest in Rosa Luxemburg, Lin Chun explores the potentials of revolution's unfulfilled promise of democracy and liberty in her book, *The Transformation of Chinese Socialism* (2006). Echoes of Marxist and Maoist phraseology recur throughout society beyond the realm of intellectuals, including in illegal labor protests. In 2002, a long letter from Li Changping, an obscure rural party official, to China's Premier, Zhu Rongji, two years earlier appeared in print as *Telling the Prime Minister the Truth*. Shocking in his detailing of layers of corruption and rural misery, Li Changping's touchstone was the Maoist critique, itself derived from Marx's "Critique of the Gotha Program," of the gaps between town and country, industry and agriculture, and mental and manual labor that he had absorbed as a child. While Marxism itself is no longer the dominant school of thought in China, China's socialist experiences and ideas serve as objects of criticism and sources of critique.

Chinese Political Thought

Modern (xiandai) entered the Chinese lexicon in 1915, and then as a translation of the Western term. The start of China's push for modernity dates to roughly the same time. Building a secure, modern Chinese nation has been and perhaps remains one of the greatest challenges facing the development of political thought since the end of the nineteenth century. Few countries have endured as many political twists and turns as China has over the past century. Moving first away from dynastic feudalism under the Qing in 1911, then onward to a national republic riven by warlords and foreign invaders, while simultaneously fighting a long civil war before establishing the People's Republic of China (PRC) under communist control in 1949, China then experienced several more political, economic, and cultural revolutions in turn.

Early Nationalism

It has been argued that the modern concept of nation is a distinctly European invention, one that has no predecessor in dynastic China. Chinese emperors, known as the Sons of Heaven, had no peers. Many Chinese believed, at times quite reasonably, that China enjoyed the world's most advanced culture and state. Many believed that even conquerors, including the Mongolians and Manchus of the Yuan and Qing dynasties, found Chinese culture unsurpassable and thus became Chinese themselves. The Chinese did not think of themselves as a nation among other nations. This

sort of thinking continued in the face of Qing decline in the nineteenth century when foreign powers “carved up China like a melon.”

Starting in the 1840s, European powers secured concessions and spheres of influence in China following the Opium Wars and a series of unequal treaties. Internal rebellions weakened the Qing further, and in 1895 it suffered a major defeat to Japan, Asia’s first modern nation. It became clear to many that nationalistic modernization was necessary to save China as well, and in 1911 the Xinhai Revolution forced the Qing to abdicate. The Republic of China (ROC) was founded a year later.

May 4th Movement

The May 4th Movement in 1919 grew out of student demonstrations against Western and Japanese imperialism and China’s inability to protect itself. The political situation had worsened in China since 1911, and warlordism was on the rise. Despite being a new nation in name, in fact, few things had really changed. Sparked initially when the Treaty of Versailles gave Germany’s former concession in China to Japan, the May 4th Movement convinced many that only radical social and cultural changes could save the nation. The question was, Could one save China if radical change meant, culturally speaking, no longer being Chinese? This period produced what is sometimes described as a crisis of consciousness, precipitating a near free-for-all of intellectual and cultural soul searching for new ways forward.

Several major developments are worth noting. The first, given the mass protests that erupted, was a sense that effective mass political participation was both possible and necessary. Other developments include the emergence of *baihua*, which called for abandoning classical writing styles for vernacular, with the goal of making works more contemporaneous and accessible to a broader readership. Liberal, pragmatist, Marxist, anarchist, and other study groups formed, often targeting each other but especially Confucianism. In defense, New Confucianism emerged, but it did so by blending Chinese and Western philosophical ideas.

Sun Yat-sen’s Political Thought

Although many people contributed to the ROC's founding, Sun Yat-sen is remembered as the father of the nation. The centerpiece of Sun's thought is his *Three Principles of the People* (1905). The first principle, *minzu*, is usually translated as nationalism, but means more literally, populism or people's rule. The second, *minquan*, is frequently translated as democracy and means people's power. The third, *minsheng*, was ambiguously defined and has been the subject of much controversy ever since. Some interpret it as socialism, while others believe it merely calls for a social welfare system.

By 1915, the ROC had fallen into the Warlord Era, further fragmenting the nation and making it even more susceptible to foreign aggression. The diplomatic failures at Versailles and May 4th were clear signals that new directions were needed. In the meantime, the Bolshevik Revolution (1917) suggested that the Leninist party system was a possible solution to China's crises. In 1923, Sun's Nationalist Party or KMT (Kuomintang) accepted Soviet aid and advisors, reorganized along Leninist lines, and invited Chinese communists to join. Sun now theorized three successive revolutionary stages: military unification, political tutelage, and constitutional democracy. Accordingly, the KMT would begin a program of unifying the country through military force, then, impose a period of single-party rule, or political tutelage, through which the nation was prepared eventually for democracy.

Sun died of cancer in 1925 and was replaced with Chiang Kai-shek, head of the KMT's military. Chiang emphasized the first principle, nationalism, at the expense of the second, democracy, and argued against socialistic interpretations of the third. With the Communist Party of China (CPC) scattered in 1927 and the warlords increasingly brought to heel by 1928, he believed China had largely achieved the first stage, military unification, and was then in the midst of the second, political tutelage under a single party.

Mao Zedong Thought

Students returning from studies and work abroad, particularly in Japan and France, were among the first to introduce Marxism to China. After the Bolshevik Revolution, the flow of Marxist materials increased and several

study groups were formed, the most significant at Peking University, which included several who would later form the nucleus of the CPC when it was founded in Shanghai in 1921. Many others would attend special programs established in Moscow for Chinese students. Moscow's advisors and support played large and various roles in the party until the mid-1930s, when Mao Zedong Thought displaced it.

The main idea of this Moscow-based way of thinking was, by 1927, a post-Leninist form of Soviet dogmatism, one that tended toward cookiecutter approaches to revolution as well as a strict adherence to Marxist theory of political development. This included the idea that a properly Marxist revolution could only be led by an urban, factory-based proletariat and could only follow a period of bourgeois rule. This idea did not change until Chiang started attacking the CPC. Moscow's response was to push the CPC into a Leninist-style revolution against the KMT in 1927, resulting in disaster.

After investigating peasant uprisings in Hunan in 1926, Mao was convinced, contrary to Marxist proletarianism, that peasants could play a progressive role in fomenting revolutionary change. Instead of fighting in the cities where the CPC was weak, Mao proposed building the Party in the countryside and pursuing guerrilla warfare, ideas that were rejected completely by his comrades. After the Party's terrible defeat following the 1927 uprising and again after the Party suffered further losses when directly confronting Chiang's KMT forces, Mao's thought gained ascendancy. Further refined in Yan'an, a western-base area reached following the Long March, Mao Zedong Thought was embraced fully and officially by the CPC.

Mao advanced a number of ideas that ran counter to both classical and orthodox Marxism, including the idea of a rural-based revolution and more significantly, the idea that the Party must learn from the people. Mao described this as following the Mass Line or "from the people, to the people." Guerrilla warfare became the norm until CPC forces were capable of more direct engagements. As the Party gained its footing, Mao formulated the idea of a New Democracy, one in which the transition to a socialist state did not first require a period of bourgeois rule.

In addition, synthesizing Chinese and Marxist thought, Mao emphasized the importance of properly handling contradictions as a means for guiding struggles to productive ends. This aspect of his thought deepened throughout his time in power, reaching an apex in the intensive class struggles that he encouraged periodically, but most especially during the Cultural Revolution (1966–76).

Mao's Great Leap Forward policies (1958–61) attempted impossible economic gains in a short period of time and resulted in serious famines and increasing instability. This instability led to Mao being sidelined briefly, though still chair of the CPC. He staged a comeback with the Cultural Revolution, during which a massive cult of personality was used to purge political opponents, primarily at the hands of paramilitary groups, Red Guards, who were devoted to him. More than this, the Cultural Revolution also targeted traditionalism and bourgeois influences, asserting that the only real barriers to successfully completing the communist revolution lay in ridding society of incorrect thinking. To be sure, he emphasized technology and scientific development, but he remained deeply suspicious of intellectuals and party elites, whom he viewed as having inherently counterrevolutionary tendencies. In his later years, he proved adept at playing leftist, rightist, and centrist factions against each other, but with the view that each had something to contribute to China's development.

With his Three Worlds Theory, Mao argued that revolution had its true impetus in the third world inasmuch as developed countries of the first world prefer the status quo, while countries in the second have been subjugated to the extent that revolution is effectively stymied. He broke with the Soviet Union over Nikita Khrushchev's de-Stalinization campaign and what Mao viewed as the betrayal of revolutionary internationalism as the USSR moved toward détente with the United States in the 1960s. Ultimately, however, he would initiate China's own opening up by hosting U.S. President Richard Nixon in Beijing in 1973.

Deng Xiaoping Theory

China's second paramount leader after Mao Zedong was Deng Xiaoping. Deng promptly assessed Mao as being only 70 percent correct and launched

several political and economic reforms designed to jump-start China's economic development and promote political stability. However, Deng recognized that the CPC's legitimacy was based ontologically on Mao's thought, and he was careful to maintain Mao Zedong Thought in several important senses. In particular, Deng focused on Mao's mantra to "seek truth from facts," which provided the basis for embarking on a new version of scientific socialism, which under Deng would include a socialist market economy and socialism with Chinese characteristics.

These concepts were rationalized in dialectical terms that had roots in both Confucian and Maoist thought. In the *Book of Rites*, Confucius discusses the quest for *datong*, or great unity or the Grand Course, which Mao and others viewed as being analogous to communism. In lieu of revolution, Confucius recommends building a well-ordered society that steadily improves through good governance. The first goal is to construct a *xiaokang* society, what Confucius describes as a "small comforts society" and what Deng describes as a "moderately well-off society." Building a *xiaokang* society, one that progresses toward *datong*, remains a central CPC goal. Assessing the country's progress to date, Deng said that China was presently only in the "early stage of socialism and would be so for a long time to come."

While Deng was amenable to a more open political culture and the possibility of political reform, he insisted on maintaining the CPC's Leninist system and China's one-party state. To this end, he promulgated the Four Cardinal Principles, which required upholding "the basic spirit of Communism, the People's democratic dictatorship, the leadership of the Communist Party, and Marxism-Leninism and Mao Zedong Thought." While some might read these principles as rather stifling, in fact, what they signaled was a greater openness than before. In other words, while these four principles were not open to discussion, everything else was.

In addition, Deng promoted the Four Modernizations, which called for modernizing China's agriculture, industry, national defense, and science and technology. While Mao had asserted that the primary contradiction facing China was found in class struggle, Deng argued that it should be found

instead in China's lack of development, a fact that left China both backward and vulnerable.

In terms of international policy, despite waging a brief but deadly war in Vietnam as a pushback against the Soviet Union in 1978, Deng declared peace and development were the main trends of the times, eschewing any hints of internationalism. These developments were central to his opening up policies, which in addition to opening up to the West for the purpose of facilitating trade, technology transfer, and increased security, were conducive to one country, two systems, which he proposed as a framework for reunifying Hong Kong, Macau, and Taiwan with the mainland.

One of the most famous quotes attributed to Deng is, "It doesn't matter whether a cat is white or black, as long as it catches mice," which many read as a turn away from Marxism and toward a more pragmatic approach. In fact, if this quote is placed in the broader context of his work, and further, if pragmatism is defined in a Western philosophical sense, then it is more appropriate to say Deng's thinking adheres to the Marxist concept of praxis. In other words, Deng was not driven by some pragmatist version of whatever works; rather, he was interested in the relationship between theory and practice, how one could be used to enrich and further the other in a progressive movement toward socialism if not communism.

Jiang Zemin came to power when his predecessor, Zhao Zhiyang, was sacked for his handling of the crisis in Tiananmen Square in 1989. Coming from Shanghai, where he was a strong advocate of Deng's economic reforms, Jiang's first several years in power were overshadowed by Deng who, despite being officially retired, was in fact still China's paramount leader. Jiang's early role was to protect as much as possible economic reforms that were threatened by policy leftists and moderates who worried that reform and opening up had gone too far and then to advance them strongly again starting in 1992 when it became politically feasible to do so.

Jiang's main contribution to Chinese political thought is known as the Three Represents, heavily promoted from 2000 and stipulating that the CPC should represent China's "advanced productive forces," "the progressive course of China's advanced culture," and "the fundamental interests of the majority." In many respects, the purpose of the Three Represents was to

explicitly theorize if not legitimize political adjustments necessitated by reform and opening up and the rise of the socialist market economy. The dramatic changes in Chinese society resulting from these developments created new socioeconomic classes and the CPC needed a basis for including these as well as capitalists in the Party itself, or at least representing their interests. At the same time, economic reforms produced rising income inequality as well as regional disparity, including urban versus rural divides. Under Mao, the CPC was responsible first to urban workers and rural farmers and opposed to their class enemies. But with Deng's reforms, China entered a period where class enemies were now required to play a central role in China's overall development. In fact, perhaps the key to understanding the Three Represents can be found in its dialectically oriented concerns of representing contradictory values and interests, and to do so in a way that enhanced the CPC's Leninist democratic dictatorship. Overall, Jiang's contributions should be viewed primarily as a development of Deng Xiaoping Theory.

When Hu Jintao replaced Jiang as head of the Party, state, and military apparatuses in 2002, the tradition of promulgating a contribution to official political thought was continued. Chief among these was Hu's scientific development concept, which called for a scientific socialism of sustainable development, increased humanism, democracy, and social welfare, which would in turn contribute to the creation of a harmonious society. In addition, Hu called for moral education and promoted what he termed the Eight Honors and Eight Shames, emphasizing patriotism, public service, unity, honesty, and so on. Officially, Hu's developments were described as an updating of Chinese Marxism; however, many analysts have argued that the discussion of morality and further, harmony, represents a decisive post-Maoist if not post-Marxist shift. Others detect elements of Confucianism. However, still others argue that Confucianism has always permeated Chinese Marxism, despite official criticisms of the same under Mao, and further, that the concept of harmony figured prominently in Mao's thought as well, especially in the Yan'an period, and that it was also present in the *datong-xiaokang* dialectic of Deng Xiaoping Theory (see earlier discussion).

Schools and Factions

Despite being a one-party state, China is a large and diverse society, one that is deeply conversant with many different schools of political thought around and through which much discussion and debate occurs today, with some of it influencing policy making. In fact, the Party itself hosts many different schools, some of which make up the principal factions at work in the Party today. It has become somewhat conventional even to refer to eight schools of political thought as being in contention with each other, both in and outside of government. These include the old left, the new left, liberals, social democrats, New Confucians, nationalists, populists, and the Party's official school, socialism with Chinese characteristics. Many of these are expressed as developments within the Marxist tradition, while some are more or less at odds with it. The old Left includes those who advocate a return to or developments of either a strong form of Maoism or Marxism or both. The new left, which was in its heyday in the 1980s and 1990s, was influenced in part by the Western New Left while being more rooted in China-specific debates, especially with Chinese liberals, who were likewise influenced by their Western counterparts and whose heyday largely mirrored that of the new leftists. Meanwhile, the social democrats have drawn inspiration primarily from European states that they view as having robust democratic social welfare systems worth emulating. New Confucianism, which as discussed above first emerged in the wake of May 4th, was effectively suppressed on the mainland during the Mao years, but returned thereafter, perhaps even influencing policy making, as some argue with respect to Hu Jintao's harmonious society campaign, as well other initiatives, including China's government-funded international network of Confucius Institutes (although officially, the primary goal of the latter is to promote the study of Chinese language). Meanwhile, unsurprisingly, nationalists tend to emphasize nationalism, while populists tend to emphasize populism. Several schools overlap; for example, one might basically advocate old left ideas but frame them with a Confucian veneer, be a staunch nationalist and a populist, and be an active CPC member in good standing.

Every period of modern Chinese history has had its share of factions and cliques committed to a particular way of thinking, both in and outside the CPC. For example, during the early years of the CPC, there were two main factions, pro-Moscow and pro-Mao. During Mao's rule, there were several

as well and they are usually typed as being left, right, or center. In post-Mao China, the CPC struggled initially to move from its more stridently Maoist aspects to Deng Xiaoping Theory, a change that proved difficult for many to make. During the Deng years, elite politics continued and often proved factional. It was under Deng that the Shanghai Clique emerged, generally described as being both urban and elitist, especially with Jiang Zemin's elevation to power in the wake of 1989, and subsequently, the Tuanpai faction, under Hu, which emerged from Hu's powerbase, the Young Communist League, and is generally described as being more populist and rural in its orientation. It has been argued that Shanghai versus Tuanpai factionalism stymied efforts for political reform during the Hu years. In addition, other groups exist in one form or another, even nongroups such as the so-called princes' party, which includes the children of former high-ranking officials who have now entered politics and who are sometimes viewed suspiciously as the beneficiaries of nepotism.

Minority Parties in the PRC

Under the rubric of a United Front, there are eight legally recognized minor parties and one union that operate under the leadership of the CPC, with a certain number of positions reserved for them in government. United Front members include the Revolutionary Committee of the Kuomintang (an offshoot of the KMT that split with Chiang in 1948 and views itself as the true inheritor of Sun's political thought), China Democratic League (a coalition of Third Way—i.e., neither KMT nor CPC—democrats advocating both patriotism and socialism, formed in 1939), China Democratic National Construction Association (an offshoot of the China Democratic League, from which it split in 1945 and which advocates market socialism today), China Association for Promoting Democracy (advocating a center-left, social democracy, also formed in 1945), Chinese Peasants' and Workers' Democratic Party (advocating socialism, formed in 1927, its original members consisting primarily of former left-wing members of the KMT and CPC, many of whom had been expelled from both parties), China Party for Public Interest (founded in 1925 and consisting primarily of overseas Chinese or those with overseas connections, originally advocating federalism and multi-party democracy, it turned left in 1947, and has advocated national reunification since 1949),

September 3 Society (founded September 3, 1945, the date of Japan's defeat in the Sino-Japanese War, and advocating a rising China), Taiwan Democratic Self-Government League (consisting originally of CPC members who survived the infamous 228 Incident of KMT suppression in Taiwan in 1947, advocating socialism; one country, two systems; and Taiwanization), and the All-China Federation of Industry and Commerce (a national but nominally nongovernmental chamber of commerce, formed in 1953, and which serves as a bridge between government and the private sector).

Dissidence

Dissidents have long contributed to China's political thought, though most have done so indirectly through activism. While many have made direct contributions to dissident thought in the People's Republic of China, three should be mentioned here. First is Liu Xiaobo, a dissident writer closely connected with Charter 08, a program calling for a slate of political reforms, including the end of one-party rule, federalism, an independent judiciary, freedom of association and religion, environmental protection, free markets and private property protection, and so on. Sentenced to eleven years imprisonment in 2009, Liu was awarded the Nobel Peace Prize in 2010. Second is Li Zehou, a leading academic who was central to much of the critical political thought that emerged in the 1980s and who was persecuted in the aftermath of 1989. Now living in exile, he advocates Sinification of Western concepts of human and civil rights and the rule of law. Although his work is not well known among China's younger generation, it remains influential with academics who were students in the 1980s and 1990s, and further, it can be argued that some of his goals have been embraced by policy makers over the past decade. Third is Wei Jingsheng, a central figure of the Democracy Wall Movement (1978–79), who proposed a fifth modernization-democracy in response to Deng Xiaoping's promotion of Zhou Enlai's earlier call for Four Modernizations (see above), although Wei's contributions were largely a footnote to dissident discussions after Deng's tenure in power.

Chomsky, Noam

Avram Noam Chomsky (1928–) is known as a libertarian socialist-anarcho-syndicalist, an American dissident, and Emeritus Professor of Linguistics and Philosophy at Massachusetts Institute of Technology. During the 1950s, Chomsky's theory of generative grammar rejected behaviorist accounts of language acquisition and produced a revolution in the field of linguistics. He came to political prominence in the early 1960s when he took a public stand, knowing he might be jailed, against United States involvement in Vietnam. Since then, Chomsky has chosen to use his privileged position as an intellectual (with access to information and resources) to continue to speak out against the American state's involvement in the Middle East, the Pacific region, Central America, and Asia.

During a lively Jewish upbringing in Philadelphia, Chomsky experienced both the impact of anti-Semitism and the Depression, writing his first political article on fascism at the age of ten. Later, he spent much time with members of the intensely intellectual but poor Jewish working class who engaged in impassioned debates around his uncle's newsstand in New York City. These political and cultural antecedents generated in Chomsky a deep mistrust of elites and unaccountable power. He regards laissez-faire capitalism and state control of production alike as autocratic and nondemocratic. Both involve the domination of productivity and human creativity. Neither system puts control in the hands of ordinary people, so neither system can be associated with freedom or the opportunity for self-fulfillment through one's labor.

Chomsky's politics is based, theoretically, on a critique of social and political affairs and a vision of a society in the service of humanity. Whether they acknowledge it or not, all political critiques rest upon an account of human nature. While acceding that there is no empirical proof for any account of human nature, Chomsky's own critique and analysis is self-consciously hopeful. Humans have a naturally creative urge and a need to control their own life and labor. Our instinct for liberty is not, however, in the liberal sense of individuals being autonomous and atomistic, but rather because our creative capacities demand the possibility of cooperative, interdependent mutuality.

Given this universal view of human nature, Chomsky argues for a society that promotes freedom and diversity. This contention is at the heart of his libertarian critique of the state. With its *raison d'être* to coalesce power in the hands of elites, particularly corporate elites, the state is a form of social organization that is fundamentally inimical to these human needs. Unwaveringly, the core of his political writings is informed by this approach.

Since the 1960s, quite apart from his work in linguistics, Chomsky has published upward of a book a year, directing his critical gaze at American foreign policy. His specific focus and method reveals conscious, deliberate political choices. First, he is of the view that, as an American citizen (the United States having a disproportionate influence in the affairs of other peoples), he is more likely to have an impact exposing the duplicity within the rhetoric of his own government. Second, although elite power is not homogenous and there are fluctuations within and between elites, the government and the state claim (and fail) to act democratically. By contrast, corporate elites make no such promise. Third, by using the media as a lens, Chomsky exposes not only the contradictions in the government's own account of itself, but also raises doubts about the extent to which the media seek truth and operate as a fourth estate.

Chomsky's intellectual and value commitment to humanity has led him to interrogate the words and actions of those who claim to represent the general interest or the interests of humanity. Empirically, he finds that the government, state, and media's interpretation of events is heavily biased

toward particular or general U.S. property and other elite interests rather than those of ordinary American citizens, let alone humanity in its most universal sense.

While Chomsky argues that the social sciences can never be predictive and explanatory in the way the natural sciences are, he is nevertheless of the view that we must still evaluate and interpret political events by critically analyzing the available empirical evidence, while also employing logic, intuition, and imagination. In a televised debate with philosopher Michel Foucault in 1971, he found no historical justification for the claim that concepts such as justice are mere social artifacts, arguing instead that in his view there is evidence that we are groping our way toward humane concepts of justice and decency. This belief, broadly speaking, places his work within the critical realist tradition, although his own view is that he is not a theorist, simply a concerned and responsible citizen.

Christian Socialism

Christian socialism

Christian Socialism

The linkage of socialism with Christianity has always been contentious, causing alienation among Christians who did not want to be considered as socialists and vice versa. The classic example of Christian Socialism is the English movement established in London in April 1848 by J. M. Ludlow, Charles Kingsley, and F. D. Maurice in response to a failed Chartist march. A manifesto was produced, “To the Working Men of England,” that confirmed their role as Christian Socialists, although the term was not used until 1850. The founders were not socialists in the later political sense, and their efforts to attract a working-class readership with their pamphlets failed as they were too moderate to satisfy the mood of growing unrest. They did, however, share a belief in cooperation and provided a radical alternative to the prevalent Christian orthodox message of the unquestioning acceptance of social and economic injustice.

The meetings of the newly formed Christian Socialists in 1848 were designed to establish some definitive policies among a group who were certainly not homogeneous. Maurice and Kingsley were more enlightened Tories than socialists. Through Ludlow, who was educated in France, the Christian Socialists learned of the ideas not only of Charles Fourier, but also of Pierre Leroux, Pierre-Joseph Proudhon, and Louis Blanc, and they were only too ready to acknowledge the debt. The English movement of 1848 to 1853 had thus some association with the contemporary French one. Another member of the group, Lloyd Jones, was a well-educated master tailor and self-professed Owenite socialist. Jones was skeptical about

Christianity but still very enthusiastic about the plans of the movement and able to add to their knowledge of socialism.

One of the achievements of the English movement was the establishment of the Working Men's College in London in 1854. Among those who taught at the College were John Ruskin and Frederic Harrison, both of whom demonstrated an interest in the cooperative method of continental socialism, although they interpreted it in different ways. Harrison adopted the positivism of Auguste Comte, while Ruskin developed a utopian ideal of a form of social paternalism underpinned by Christian morality.

The Christian Socialists ceased to function as an organized unit in 1854, but their influence lived on through the work of a few scattered individuals, some of whom proved to be very influential in the socialist renaissance in the last quarter of the nineteenth century. Christianity, as preached by the established church, was perceived to have failed to address the needs of the working classes and was further challenged by the emergence of numerous politically and socially active groups and individuals. One disparate group of reformers worked under the common pennant of a revived Christian Socialism, taking their inspiration from the first Christian Socialists of the 1850s. A large part of this socialist revival was, if not orthodox Christian, at least ethical in nature. The revived movement's leaders were primarily nonconformist in their beliefs, and they operated in most large cities where they exerted a strong influence among working-class audiences. They were not actively radical but rather combined their politics with their preaching as a matter of course, many of them preferring to remain detached from direct political action. There was some dispute among socialist adherents as to the compatibility of religion and politics, but many on the Christian left saw the policies of Christianity and socialism as inextricably interrelated.

In terms of influence on the socialist cause, the English Christian Socialist Movement has a complex relevance. The early movement saw its function as mainly ethical and educative rather than the promotion of social engineering or political legislation. It was anticollectivist, favoring small-scale cooperative enterprise and adult education as the way out of working-class poverty. By the end of the century, in a climate of economic depression, the focus of Christian Socialists was more political. Their

preaching was directed at specific examples of economic injustice and exploitation as highlighted in Ruskin's *Unto This Last*. Ruskin deplored the culture of competition and underpinned his opposition to laissez-faire economic policy with a Christian emphasis on brotherhood and cooperation. This ethical approach was inspirational for many newly emergent labor members, and under the banner of the Independent Labour Party, it became the dominant form.

In the United States, the experience was slightly different. During a period of social unrest at the end of the nineteenth century, there was considerable tension between labor and religion. To combat this tension, there was a unique and concerted effort by religious leaders not to Christianize socialism but to spread an awareness and appreciation of undiluted socialism among people of religious belief. This effort led to a more harmonious relationship between ethical idealists and labor activists.

Christian Socialism may therefore be seen as primarily the successful and lasting contribution of groups of intellectuals to the raising of awareness of social deprivation and the desperate need for urgent social and economic reform within a religious or ethical context.

Citizenship

Citizenship

141

143

Citizenship

In the simplest terms, citizenship is a legal status that bestows equal membership and rights, including the right to political participation, and gives rise to duties relating to citizens of a bounded community. As such, citizenship indicates some type of belonging or identification between the citizen and her community. Since the early 1990s, however, citizenship has also been ascribed a thick description by scholars and politicians alike, as it has increasingly come to represent what A. Favell has described as “a litmus test of the nature of liberal democracy generally” (2001, 1). The different meanings of citizenship are, therefore, both strongly contested according to Ruth Lister (2003) and always contextual according to Birte Siim (2000). Broadly speaking, current debates within political theory, and sociology-social policy about the theorization and meaning of citizenship, led by authors such as Richard Bellamy (2008) or Lister (2003), respectively, center on the extent to which the concept can be extended beyond its narrower definition, as primarily comprising rights and duties, to being conceptualized more broadly. So, for example, some theorists, notably Nira Yuval-Davis (1999), have argued that citizenship should be viewed as a multilayered concept since citizens have rights and obligations in all of the communities (layers) to which they belong, including local, ethnic, religious, national, regional, and transnational as well as international communities. Most recently, the argument has been made that citizenship is also multidimensional, especially when viewed from a gendered perspective, insofar as citizenship rights and obligations cut

across a number of key dimensions, including the political, social, economic, sexual, bodily, and intimate dimensions (see Halsaa, Roseneil, and Sumer 2012).

In addition, contemporary theorists of citizenship such as Y. N. Soysal (1994), G. Delanty (2000), Linda Bosniak (2006), M. M. Howard (2009), and C. Joppke (2010) have busied themselves with what R. Baubock and V. Guiraudon (2009, 439) have termed the “realignments of citizenship” in the global north, triggered by the twin phenomena of increased patterns of migration, on one hand, and multilevel governance (both substate and supranational) on the other. Delanty (2000) contends that although the theorization of citizenship was originally dominated by political scientists, the challenges to citizenship resulting from the processes of globalization have opened the way for other social scientists to make valuable contributions to this scholarship. Citizenship studies today is, thus, a burgeoning interdisciplinary field of study. Within this field, wide-ranging academic interventions have challenged the universalism that is assumed to underpin citizenship.

Feminist scholars have highlighted the ways in which access to the rights and privileges deriving from citizenship have been constrained for women: see, for example, important contributions from Mary Dietz (1987), Siim (2000), and Lister (2003). Feminist scholars have also highlighted the pitfalls of traditional conceptualizations of citizenship in relation to other disadvantaged groups (apart from women), such as ethnic minority and migrant communities: as in the work of Iris Marion Young (1989), Yuval-Davis and Pnina Werbner (1999), and Gail Lewis (2004). One of the foremost proponents of a feminist reappropriation of the concept of citizenship is Lister (1997, 2003), who has outlined three important steps for feminist theorizations of, and activism relating to, citizenship. The first task is to show how women’s exclusion has been central to the historical and traditional conceptualizations of the liberal and republican approaches to citizenship that have been prevalent in European settings. Anne Phillips (1995) and Sylvia Walby (1997) have also made important contributions in this regard. The second task is to challenge the false universalism of the category woman and to centralize the issue of difference, and the third task

is to address the tension between a gender analysis that is grounded in difference, and the inherent universalism of citizenship (Lister 1997, 197).

A second notable group of scholars who have made valuable contributions to current debates about citizenship are concerned with the relationship between racialized, ethnic, and religious differences and citizenship. Anniken Hagelund (2007, 128) has noted that multicultural has come to signify both the reality of cultural, ethnic, and religious diversity within societies (usually those in the global north) and political ideologies of multiculturalism that seek to establish policy processes that recognize the claims of diverse groups. Will Kymlicka (1995, 2007) has argued that “multiculturalism is first and foremost about developing new models of democratic citizenship, grounded in human rights ideals, to replace earlier uncivil and undemocratic relations of hierarchy and exclusion” (2010, 101). Accordingly, Kymlicka’s concept of multicultural citizenship (which is, of course, context specific) is based on the ideal of not suppressing differences but of filtering and framing them “through the language of human rights, civil liberties and democratic accountability” (2010, 100). He makes a distinction between new forms of multicultural citizenship for indigenous peoples (such as the Saami populations in the Nordic region), for national minorities (such as the Flemish and the Walloons in Belgium), and for immigrant groups in Western democracies (2010, 101).

Finally, the intensified (forced as well as voluntary) migratory practices that broadly characterize the globalization processes of the mid- to late twentieth and early twenty-first centuries, have also led scholars to re-imagine the concept of citizenship. Hence, the development of transnational, postnational, and cosmopolitan approaches to citizenship by Baubock (1994), Soysal (1994), and Delanty (2000), respectively. Within this type of literature, the focus has recently turned toward the exclusionary tendencies that are as inherent a part of citizenship as its assumed universality. An important example is Bosniak’s work (2006) on alienage—that is, the condition of noncitizens in liberal democracies with a focus on the United States. This is a noteworthy turn in citizenship studies because it addresses how liberal democracies deal with, and attempt to reconcile, citizenship’s internal (normative and analytic) contradictions: the twin commitments to universalism and exclusion.

Civil Disobedience

Civil disobedience involves protest or illicit action based on an individual's prioritizing of obligations to religion, humanity, conscience, and legal codes of city, state, and nation. Lawbreakers commit themselves to ignoring or violating codified laws that disrespect or contravene spiritual or humanistic truths. As a concerted demand for human rights and freedoms, civil disobedience by marginalized groups targets the disenfranchisement of racial and religious minorities, immigrants, laborers, refugees, and women and children. Illegal actions range from the unfurling of forbidden flags and banners, concealment of runaway slaves and draft dodgers, sit-ins in government buildings, and nonviolent obstruction of trains and convoys to the dismantling of torture chambers, ruination of files and records, and vandalism against artillery and war planes.

During the colonial era, Bartolomé de Las Casas launched a radical evangelism against the inhuman treatment of Mesamerican press gangs by Spaniards. From the 1620s, Baptists and Jehovah's Witnesses flouted laws of an obdurate Puritan theocracy requiring Sunday worship and denying rights of conscience and assembly to dissenters. Pacifist Quakers and Rogerenes rebelled against the arming and drilling of standing militias and refused to pledge allegiance to uniformed regiments or to pay military taxes or perform alternative service.

The growing acquisition of wealth and prestige by European male conquerors aroused rebellion in the underclass. In the 1760s, the antics and

plots of U.S. Liberty Men, Regulators, and the Sons and Daughters of Liberty forced the government of England's George III to reexamine cries for independence that resulted in the American Revolution. In Venezuela in 1817, Simón Bolívar threatened Spanish hegemony by raising an army of Haitians. Under the influence of Henry David Thoreau's *Civil Disobedience* ([1848] 2009), Canadian, Caribbean, and U.S. protesters rallied for even fuller realization of citizenship and an end to the Mexican-American War.

Abolitionists and Jamaican maroons promoted flights from bondage as a rightful emancipation of African slaves. Teachers violated state laws denying literacy to blacks by opening illegal classrooms; black urbanites banded into extralegal police forces to shield the vulnerable from kidnap and sale at slave auctions. A budding feminist backlash against the concubinage of slave women and girls pressed white women into pickets against enslavers and boycotts of slave-made cotton, molasses, and pharmaceuticals. By the 1870s, labor strikes, the peace movement, and woman's suffrage honed the skills of Susan Brownell Anthony, Emma Goldman, Mother Jones, and Alice Paul as crusaders against polygamy, repression, and violence.

In the early 1900s, freedom fighters resisted blatant exploitation of child labor, immigrant miners, refugees, chain gangs, and Native Americans coerced to live in squalor on Indian reservations. Carry Nation focused outrage on brothels and saloons. Dr. Marie Stopes opened birth control clinics in London to enable women to regulate family size.

Both world wars reignited peace lovers to march, chant, and block enlistment centers to thwart the drafting of combat-age males. Simmering racial inequities burst once more into headlines as blacks fought white supremacy in South Africa, Japanese Americans contested internment in quasi-concentration camps, and black U.S. soldiers violated Jim Crow laws that remanded them to second-class consumerism in bars and restaurants and on public transportation. In 1930, Mohandas Gandhi led a nonviolent protest against a salt tax and formulated strategy for ousting the British from India. The bombing of Hiroshima on August 6, 1945, galvanized antibomb sentiments in seeking to prevent a global catastrophe.

Globally, the late twentieth century echoed with outcries against animal and human torture, Canadian gun laws, the state of Israel, endangerment of species, war in Vietnam, and world hunger. Controversy resounded over Filipino agitation against Ferdinand Marcos, an Indian occupation of Alcatraz, same-sex marriage, and Zapatista prison sabotage. The disregard of unjust laws precipitated incarceration for leaders Nelson Mandela, Ellen Johnson Sirleaf, and Aung San Suu Kyi, who served fifteen years of house arrest for assailing tyranny in Burma. The vocal protest by 100,000 Beijing students at Tiananmen Square in April 1989 and a hunger strike in May preceded a symbolic pose of civil disobedience—one man standing alone before a tank column at the risk of execution.

Awarding of the Nobel Peace Prize drew public attention to the insubordination of revolutionary Le Duc Tho to French colonialism, the Dalai Lama's support of a Tibetan mutiny against Chinese occupation, humanist Adolfo Esquivel's destabilization of an Argentine military junta, and Russian activist Andrei Sakharov's insubordination of Russian militarism. The spring of 2011 spread discontent among Islamic dissenters in Egypt, Libya, and Tunisia to overthrow tyrants and extend democratic rights to males and especially to veiled women. In historic instances, the line between civil disobedience and civil war stretched thin.

Civil Society

Civil society is a key concept in modern political thought and like many such, is much disputed. The term, although sometimes used in very different ways, plays a central role in a variety of political theories, including classical liberal and libertarian, Marxist, social democratic, and conservative theories.

The concept and the term emerged in Europe out of the medieval communes, which were generally oath-based fellowships of citizens. The term *civil* comes from the Latin *civitas*, which refers to a city in its juridical—rather than physical—existence. It has since come to refer, not only to the legal and political orders of such cities, but to the standard mode of behavior—civility—that characterized them and the voluntary and contractual nature of their relationships. Civil behavior allows unrelated persons to interact on a basis of mutual respect. It does not require an overarching loyalty to a leader, a religion, or even a city or country. Civil behavior includes showing respect for strangers and rests on respect for persons, for property, and for promises. The communes were typically founded by merchants, who had no place in the feudal understanding of social arrangements, and thus created, in effect, their own order alongside that of knights, clerics, and peasants. That order was characterized by the virtues common among merchants: punctuality, respect among trading partners endowed with rights, and as a condition of general flourishing, freedom to purchase or not to purchase—that is, freedom of contract.

As the new cities were primarily places of trade and commerce, freedom was a central value. In Henri Pirenne's (1937, 50) words, "Without liberty, that is to say, without the power to come and go, to do business, to sell goods, a power not enjoyed by serfdom, trade was impossible." The early civil societies were known as places of freedom, as expressed in the old German slogan "*Stadtluft macht frei*" (city air makes one free), and peace (Pirenne notes, "The burghers were essentially a group of *homines pacis*—men of peace"; Pirenne 1969, 200). Such civil societies were, at least in their founding periods, constituted by rather robust social contracts, often in the form of oaths that were affirmed annually by the citizens in the public square.

Starting in roughly the eleventh century in western parts of Europe, urban life began to reemerge. Many cities were formed, either on the basis of older cities (often the seat of a bishop of the Christian church) or as settlements in entirely new locations. In addition to the orders of peasants, knights, and clergy there was added a new social status: burgher, or citizen. The term *burg* comes from the Germanic languages and refers to a strong or fortified place. (Typically, the new settlements were protected by walls.) In European languages, two terms emerged: *burgenses* and *civitas*. As the German historian Hans Planitz (1954, 100) noted, "The expression *burgenses* was at first used only if the city was not a *civitas*, and *civitas* was at first only the old episcopal seat ('*Bischofsstadt*')." *Burgensis* and *bürgerlich* enter English via French as *bourgeois*. Later the derivatives of the terms—*bürgerlich-bourgeois* and *civil*—came to be used interchangeably. (*Burg* persisted in English in such names as Hillsborough, Pittsburgh, and in the name of the oldest representative assembly in English colonies, the House of Burgesses.)

Rather than distinguishing civil parts of society or a social order from uncivil parts, the term *civil society* distinguished civil societies from other forms of human association, such as relationships based on slavery or feudalism.

The rights of burghers-citizens that made possible such a society came to be known as civil rights; that term in modern American parlance has narrowed in scope to refer the right against discrimination by the state, but that usage

emerged from the demand by black Americans and their supporters for equal rights of citizenship—that is, for equal membership in the civil society.

The political philosopher James Harrington ([1656] 1992) used the term civil society in the seventeenth century to refer to those people governed by a common set of laws, or government, rather than by the arbitrary will of rulers:

Government (to define it *de jure* or according to ancient prudence) is an art whereby a civil society of men is instituted and preserved upon the foundation of common right or interest, or (to follow Aristotle and Livy) it is the empire of laws and not of men. (8)

Thus, the rule of law was considered an important element of civil society from its early usage.

John Locke (1988) used the term interchangeably with political society to refer to a voluntary social order with a common government:

The only way whereby any one divests himself of his Natural Liberty, and *puts on the bonds of Civil Society* is by agreeing with other Men to joyn and unite into a Community, for their comfortable, safe, and peaceable living one amongst another, in a secure Enjoyment of their Properties, and a greater Security against any that are not of it. This any number of Men may do, because it injures not the Freedom of the rest; they are left as they were in the Liberty of the State of Nature. When any number of Men have *so consented to make one Community* or Government, they are thereby presently incorporated, and make *one Body Politick*, wherein the *Majority* have a Right to act and conclude the rest. (330–31)

Locke distinguished the civil or political society from the government that may be delegated powers to act on its behalf; what characterizes being in

civil society, as opposed to a state of nature, is the existence of a common judge among persons who are in civil society with regard to each other; as with the state of nature, civil society for Locke is a relational term. One can be in a condition of the state of nature with regard to some persons, but in civil society with regard to others.

Immanuel Kant (1985), in line with Locke, defined civil society as “the condition of being subject to general external (that is, public) legislation that is backed by power is the civil society” (65).

The term, in its various German, French, and English usages, has been used to refer to the society under a common judge or community, to the organizations within it, and to a wider web of organizations and affiliations and relationships that may extend beyond the borders of any particular state, thus, an international civil society.

The German philosopher Georg Wilhelm Friedrich Hegel (1977) added a twist to previous definitions by characterizing civil society in terms of the alleged motivations of the persons within it: thus, “individuals in their capacity as burghers are private persons whose end is their own interest” and civil society (*bürgerliche Gesellschaft*) is “the battleground where everyone’s individual private interest meets everyone else’s” (124, 189). Karl Marx (1964) followed Hegel’s lead in this regard, and in his “On the Jewish Question,” he stated, “The so-called rights of man, as distinct from the rights of the citizen, are simply the rights of a member of civil society, that is, of egoistic man, of man separated from other men and from the community” (24). Thus, businesspeople, traders, merchants, and the like, who are alleged to seek only their own profit, are for both Hegel and Marx the archetypical specimens of civil society.

Some more recent thinkers who have deployed the term, from both the left and the right, have reversed Hegel’s and Marx’s characterization and have distinguished civil society as precisely distinct from for-profit enterprise, as between state and market or as characterizing exclusively nonprofit organizations. The leftist thinkers Jean Cohen and Andrew Arato (1992) characterize civil society as “a sphere of social interaction between economy and state, composed above all of the intimate sphere (especially the family), the sphere of associations (especially voluntary associations),

social movements, and forms of public communication” (ix). The conservative thinker Don Eberly (1996) defines civil society as

an intermediary sector, where private individuals join voluntarily in associations that operate neither on the principle of coercion, nor entirely on the principle of rational self-interest. In fact, the modus operandi of life in civil society gives expression to the pursuit of the common good, where actions are animated by a spirit of trust and collaboration. (30–31)

Such attempts to characterize civil society as neither market nor state, with the market conceived as based exclusively on the pursuit of self-interest and the state conceived as exclusively coercive, run into a variety of logical problems, for coercion can be deployed for self-interested reasons and voluntary exchange can be deployed for charitable reasons. The former is common enough and is usually characterized as corruption or rent-seeking. With regard to the latter, a philanthropist may purchase blankets and medicines in the market and, one would suppose, seeks the lowest prices when doing so to maximize his or her ability to assist those in need. Characterizations or definitions of civil society in terms of nonexclusive categories (not coercive and not selfish) thus run into difficulties; they cannot provide a comprehensive, or perhaps even useful, taxonomy of human interactions.

Thus, when comparing the use of the term civil society across various political ideologies and thinkers, it is wise to pay close attention to how it is being used. It may be used to mean selfish persons, or altruistic persons, or noncoercive and nonselfish persons, and so forth.

A more neutral and descriptive definition was offered by the sociologist Reinhard Bendix (1978), who stipulated simply, “Civil society refers to all institutions in which individuals can pursue common interests without detailed direction or interference from the government” (523). Understood along those lines, civil society can be clearly distinguished from totalitarian societies that seek to encompass the individual entirely within a totalizing state or party ideological identity. It also distinguishes civil society from

older forms of interaction based on slavery, serfdom, or other forms of domination. Civil societies allow for individuals to form both complex social relationships and through them, complex personal identities. Communal identities, as promoted by various communitarian philosophies, tend to see the individual's identity as entirely circumscribed by the borders of the relevant group, whether religious, ethnic, racial, linguistic, or other. In civil societies, in which individuals enjoy the civil rights of freedom of association and contract, each individual can construct an identity that is unique.

The sociologist Georg Simmel (1972) characterized the relationship between the individual and groups as follows:

The groups with which the individual is affiliated constitute a system of coordinates, as it were, such that each new group with which he becomes affiliated circumscribes him more exactly and more unambiguously. To belong to any one of these groups leaves the individual considerable leeway. But the larger number of groups to which an individual belongs, the more improbable it is that other persons will exhibit the same combination of group-affiliations, that these particular groups will “intersect” once again [in a second individual]. (150)

Simmel suggested that the relationships of person and groups in civil society could be characterized, not in terms of concentric circles, as communitarians suggest, but in terms of infinitely complex sets of intersecting circles. Drawing on a comparison between modular furniture, which one can buy in increments and construct unique, but complementary, arrangements for one's home or office, Ernest Gellner (1994) identified civil society with the ability to create unique identities: “What genuine Civil Society really requires is not modular furniture, but modular man” (97).

Role complexity and individuality are thus central features of civil society. Increasingly, as interactions among humans cross and cross again a multitude of borders and boundaries, civil society is increasingly capable of being distinguished from the political society with which Locke associated

it, that is, with membership in a particular political community governed by the rule of the majority. A Korean and a Kenyan may interact regularly on the basis of commonly understood rules of behavior, although they do not, as Locke stipulated, “make one Community or Government.” Their relationship, whether commercial, religious, or social, fits Bendix’s (1978) definition of civil society as characterizing “all institutions in which individuals can pursue common interests without detailed direction or interference from the government” (523). The institutions through which they pursue common interests are increasingly, in the modern era, detached from particular nation states or political societies and governed by either multigovernmental units of governance or systems of law and adjudication that are quite independent of governments.

International civil society offers far greater scope for role complexity and complex forms of identity than were available in the past, as individuals are now able to interact in ways unimaginable to previous generations, through electronic communication, social media, fast international travel, and so on.

Class

The concept of class distinguishes groups within a population. It is important to recognize that differing conceptions of class do so in disparate ways. As it takes shape as an issue in eighteenth-century political thought, class cuts society along the lines of economic function—focusing, for instance, upon landowners and merchants as economically distinct groups. It was commonly argued that members of a class shared interests that differed from, and might conflict with, those of other classes. The implications, however, for interests of class as position within the economic order were disputed. In understanding the place of class in political thought since 1750, it is essential to grasp that the questions of how best to define class and to understand its operation, were often inextricably bound up with broader debates so that variously and importantly contrasting conceptions of class were mobilized in support of divergent visions of politics.

Accounts of class as a description of society could differ in a variety of ways. When and why did separate economic roles give rise to classes? What was the relationship between economic activity and social being? Should class be expected to determine political behavior? Was class an enduring and self-replicating feature of society? Shared descriptions of society do not entail normative consensus about politics: agreement about the existence of classes does not preclude sharp conflict over political ends generated by, for instance, contrasting assessments of the value of equality. Particular understandings of class could, though, have radical consequences for the status of political thought. A determinist conception of class in

which economic structures were taken to shape ideas undercuts the notion of political thought as an independent intellectual project.

Perhaps the most familiar understanding of class is one in which the linkages between the economic, the social, and the political are very tight and in which the direction of causation is seen as running from the first through to the last. This understanding, however, needs to be placed alongside approaches that present the linkages as much looser and in which causation is not one directional. Within the former, the fit between objective accounts of social structure and subjective perceptions of social life and the self is held to be very close; within the latter, the gap between structures and perceptions can be extensive. Indeed, class can be seen as a widespread and important identity to which individuals cleave while explaining its incidence in primarily cultural terms. Whereas, however, proponents of a strongly material conception of class have often (though not always) presented it as the master key to understanding society, analysts of class as an identity less shackled to economic structures have been more likely to see it as one among a variety of aspects of selfhood (e.g., gender, ethnicity, religion) and to place less explanatory store by it.

What is the significance of class for thinking about politics? Why has it mattered for political thought since the mid-eighteenth century? One common answer has been to argue that class-as-economic-position produces persistent inequalities of social and political power that are unjust and unacceptable. There are, however, other answers. The consolidation of distinct economic classes was seen by some early opponents of commercial society as a source of political instability, whereas its defenders countered that the interdependences created by the developing division of labor actually reduced political conflict. Civic republican critics argued that the separation of classes in commercial society weakened attachment to the common good and discouraged the participatory virtues of citizenship. Romantic critics argued the growth of classes imprisoned the self within the fetters of commercialism and shattered the bonds that should integrate individuals within an organic social whole. Normative objections to the consequences of class were not confined to claims about distributive injustice; the damaging impact of class on the psychological health of the polity was a recurrent theme. Proponents of commercial society were

generally less troubled by sharpening social cleavages. This acceptance might be because market outcomes were seen as inherently just, either because the ensuing allocation of goods was viewed as meritocratic or because free exchange between individuals was taken to be a just process in which no one was harmed. It was, however, often that growing class inequalities were seen rather as a price worth paying for the unique capacity of commercial society to secure basic needs for all. It is thus apparent that the implications of class for normative political thought have historically been interpreted in a variety of ways.

Commercial Society, Class, and the French Revolution

In the mid-eighteenth century, class as a socioeconomic phenomenon emerged as a subject of political thought in the interconnected debates about commercial society in Britain and France. In both countries, commentators debated the merits of a changing society in which commerce, manufacture, and towns were growing in significance relative to agriculture and the countryside. Within these discussions, class as economic role loomed large as rival views were developed of the political implications of the increasing division of labor. The debates were complex, embracing a range of questions, not least over the nature and desirability of economic growth. In France, from mid century, the physiocrats were associated with the argument that the interests of agriculture were to be privileged over those of manufacture, though the second generation of physiocrats that included Robert Jacques Turgot actually held a more nuanced view. In Britain, writers indebted to republican modes of thinking feared that the distinct roles occupied by different classes in commercial society drastically curtailed the independence required for the exercise of political virtue and with it, the prospects for free governments. Adam Smith shared some of their concerns about the impact of commercial society upon the more martial virtues but argued that for all their inequalities, dynamic commercial societies were able to secure the material needs of their members in a way that previous kinds of society could not. In Germany, antagonism toward the advent of commercial society was more pronounced than in Britain or France. As in Britain and France, though, class was

emerging as an important topic in political thought. Georg Wilhelm Friedrich Hegel's analysis of the character of civil society owed much to Smith's political economy. For Hegel, civil society was shaped by the particularities of class. It was through politics and the state that universality was to be obtained, though civil society was to endure as a field for the assertion of particular interests. The novelties of political economy and the specter of commercial society directed the attention of European political thinkers of the late eighteenth and early nineteenth centuries to the implications of class.

Debate about class was deeply affected by the major political event of the period: the French Revolution. The Revolution raised profound questions about the relationship between social and political change. Differing explanations of its origins and course offered contrasting interpretations of the link between class and politics, but in this respect as in others, the Revolution had large consequences for thinking about politics. French liberals in the 1820s, such as François Guizot, sought to understand why British and French politics had diverged so dramatically, and class emerged as a crucial element of their explanation. The early growth of royal power in Britain had encouraged an alliance between the aristocracy and the rising middle class that limited the monarchy, whereas in France the strength of the feudal nobility produced a combination of the crown and the bourgeoisie that led to sharp social tensions and a pronounced centralization of state power. French debates tended to attribute greater independent importance to culture than was evident in the conjectural histories of the Scottish Enlightenment with their strong focus upon the determining force of the mode of subsistence. Nonetheless, in their attempts to explain the peculiarities of French history, writers such as Guizot and later Alexis de Tocqueville, produced powerful accounts of the relationship between social change and political development in which class relations shaped the possibilities for political action and which had a significant legacy for political thought.

Karl Marx, Socialism, and Max Weber

By far the best-known account of class in the nineteenth century is that of Karl Marx. Indeed, the history of class in political thought is sometimes

treated as though it were interchangeable with the history of Marxism. This treatment is, as we have seen, misleading, since it neglects earlier debates and omits the significance of class in much non-Marxist political thought. We obviously need, though, to assess the place of class both in Marx's own thinking and within subsequent Marxist traditions whose relationship to the historical Marx could be fairly attenuated. Marx's work has attracted an immense amount of commentary and generated a corresponding quantity of controversy. It is, though, possible to detect some important commonalities in the literature on Marx. First, there has been an increasing effort to locate Marx more precisely in his nineteenth-century context rather than to read his work through the prism of subsequent events and interpretations. This effort has led in particular to a renewed focus upon Marx's debt to, and relationship with, Hegel and Hegelianism. Second, and relatedly, much writing has stressed the differences between Marx and Friedrich Engels and to argue that it is the latter, notably in his *Anti-Dühring*, who was primarily responsible for popularizing a scientific, law-like version of Marxism, shorn of the more philosophical and Hegelian tendencies of Marx's own thought. Third, many commentators have come, albeit for different interpretive purposes, to insist upon fundamental continuities between the early and the late Marx. Disagreement, however, persists, not least over Marx's portrayal of the relationship between economics and politics and more generally, about the place of the political in his work.

The idea of class conflict is at the heart of human history in the *Communist Manifesto* (1848). This theme was not its first manifestation in Marx's work, and others were writing about it at the time. The *Manifesto*, however, placed class at the center of both its economic analysis and its political prescription, identifying the role of the bourgeoisie in creating the contemporary world and that of the proletariat—as a universal class—in establishing the communist future. Conflict between classes is deeply concerned with property relations: a world without class conflict will be a world without private property. The *Manifesto* supplies a fairly stark view of class; elsewhere, Marx offered more complex accounts of class structure, of the relationship between economic position and social consciousness, and of the class basis of the state. Some see Marx's use of class as a determinist form of antipolitics in which the emergence of both abundance and the proletariat creates the conditions for the transcendence of the state.

For such critics, the way Marx employs class helps explain his failings as a theorist of politics. Others, though, regard Marx's approach to class as less determinist and view his reluctance to supply blueprints for future politics as a reflection of his progressive understanding of human development.

The subsequent consolidation of Marxism in the later nineteenth century owed a great deal to Engels and tended to project its tenets as an allegedly scientific creed. In these years, Marxist orthodoxy, as forcefully set out by Karl Kautsky, insisted upon the determining power of economics, the relative immiseration of the proletariat, and the inevitability of class polarization and conflict. The heyday of classical Marxism in Western Europe was, however, relatively brief. By the interwar period, writers such as György Lukács and particularly Antonio Gramsci, were attributing a role to culture and ideas in explaining patterns of subordination that breached the formulations of late nineteenth-century classical Marxism. Late nineteenth-century Marxism was not itself monolithic. The controversy over revisionism, especially associated with the work of Edouard Bernstein (1961), elicited a lively debate over the class structure of contemporary capitalist societies. Late nineteenth-century socialism more broadly contained alternative articulations of the significance of class. British Fabians concluded that socialism was evolving peacefully out of existing capitalism and argued that differential productiveness, among humans and natural resources, militated against a static state-less future in which plenty eliminated all questions of distributional justice. For such evolutionary socialists the proletariat was not a universal class, class conflict was not an obligatory prelude to the establishment of socialism, and no end point to social change could be foreseen.

Socialism, and Marx's thought in particular, was a significant context for the enduringly important work of Max Weber. Like Marx, Weber has been the subject of countless studies, and his writings continue to provoke disagreement. Again, like Marx, much of what he wrote was incomplete, or occasional. His status as a founding father of sociology has not always aided recovery of the character of his work in its historical context. Weber sought to understand the nature of modernity, emphasizing the scale, complexity, and power of the contemporary state, especially in large countries such as Germany. His writings combined a serious interest in

political economy, evident in his concern with the growth of trusts, with an acute sensitivity to the changing conduct, manners, and psychology of modern life. His thinking about class embodied these larger concerns, not least his desire to comprehend the character and distribution of power. Class positions were a result of relative market power. The economic basis of class altered over time as different markets (credit, commodity, labor) assumed primacy. Class situations could be the basis for collective action, but Weber argued status groups, in which similar patterns of consumption underpinned a shared life style, were more likely to constitute communities.

Weber was concerned to defend the autonomy and importance of the political, rejecting both the reduction of politics to economic interests and the elevation of subjective impulses into political creeds. Any serious reckoning with political reality had to recognize the inexorable growth of bureaucratic rationality and to confront the implications of the state's monopoly on the legitimate use of violence. Insisting on the inescapable conflict between cherished values, Weber offered a stark picture of demands of modern political life upon one who sought to combine conviction and responsibility.

Class, Social Justice, and Egalitarianism

In some respects, the story of class in twentieth century Western European political thought is more straightforward than that for earlier periods. The concern of many nineteenth- and early twentieth-century commentators with the psychological consequences of class divisions and with preserving the qualities of the good citizen, arguably becomes less central, while questions about distributive justice become increasingly prominent. Within Marxist debates in Western Europe, alienation certainly emerged as an important theme, encouraged by the rediscovery of some of Marx's early work, and by a broader growth of interest in Hegel, notably in France. Analyses of the ways in which capitalism and advanced industrialism led to a loss of self echoed earlier concerns with the psychological and moral consequences of commercial society. Both production and consumption within capitalist class society could be seen as sources of estrangement, with the deadening routines of factory life in the former matched by the illusory fascinations of the commodity in the latter. Among the British New

Left thinkers of the 1950s and 1960s, such as E. P. Thompson, elements of the romantic critique of commercial and industrial society recurred.

While discussion of class within Western European political thought was multifaceted throughout the twentieth century, controversies over equality and social justice loomed large. Egalitarianism played a central part in political thought on the broad left, including socialists and progressives. Within this tradition, class was regarded as the key form of inequality in contemporary society because of its structural, self-reproducing character. The chief task of politics was to address this. Much debate was generated over how best to do this: to what extent could a redistributive welfare state mitigate class inequality, or was state control over large parts of economic life required? Did the provision of equality of opportunity—a widely shared ideal across many countries for much of the century—require strict equality of outcomes, or at least a very substantial reduction in distributive inequality? It was commonly argued among progressives that inherited class position powerfully shaped life chances and hence that genuine equality of opportunity was impossible in a highly stratified class society.

Currents of political thought in which equality occupied a much less significant place tended to view these issues rather differently. Champions of liberty as the foremost political value—especially those who understood liberty as the absence of interference—worried less about equality, and consequently class. The extent to which class in the sense of inherited economic circumstances affected life chances was often disputed by libertarians of various hues, but the more fundamental divergence was over the meaning, significance, and relation of freedom and equality as political values. These kinds of disputes often lacked the rich attention to social and political realities evident in earlier debates.

Within Anglophone political thought, the currency of utilitarianism, along with techniques borrowed from economics, encouraged a focus on maximizing welfare that often discerned trade-offs between inequality and productivity. Utilitarianism has taken a variety of forms and ever since John Stuart Mill has often been importantly combined with other approaches, but it tended to foster a focus on the welfare of individuals that did not

incorporate the interest in groups and the relationships between them that had motivated much writing about class among political thinkers.

The ascendancy of utilitarianism was taken by John Rawls as a point of departure in his work on justice that is often regarded as rejuvenating Anglophone political thought. The egalitarian liberalism with which Rawls is associated was sensitive to resource inequalities. It has, however, perhaps been less concerned to offer the sort of detailed social and political analysis of existing institutions central to political thinkers for whom class was a key category. Within the Anglophone political theory boom initiated by the work of Rawls, there emerged a school of analytical Marxists, such as John Roemer and G. A. Cohen, for whom a structural understanding of class was a central aspect of their thought. Such writers refocused attention upon the ethical exploitation they took to characterize societies in which ownership of the means of production was unequal.

Analytical Marxists defended a fairly traditional, even deterministic, conception of class. However, within Western European political thought more generally, the last thirty years have witnessed a growing emphasis upon the diverse sources of the self and upon the constitutive role of language, culture, and history in shaping the self. It can be argued that this is apparent in the political thought of sociologists who retain an interest in both class and classical sociology, such as Anthony Giddens and W. G. Runciman. It is, though, more evident in the communitarian response to egalitarian liberalism, which was profoundly concerned with the collective identities but for whom class was usually merely one such identity and whose interests were often more directed to other identities, such as those of religion or ethnicity.

The diversity and complexity of contemporary political thought elude simple summary, but it would not be right to suggest that class has disappeared as a subject. It might, though, be suggested that the formal character of much recent political philosophy can lead to a relative lack of attention to the social and institutional constraints within which politics occurs and that were of great concern to earlier political thinkers for whom class was a crucial means of understanding those constraining realities. For much of the period from 1750, the implications of class for political thought

were of intense interest. This interest emerged in the eighteenth century as part of the attempt to comprehend commercial society and endured, registering across the political spectrum. Marx's and Weber's contrasting approaches to class have proven enduringly important, but class was a subject of much wider concern in nineteenth- and early twentieth-century political thought, and this larger debate in turn provides the crucial context for their seminal work.

Cobden, Richard

Richard Cobden (1804–65) was an English manufacturer, radical politician, and a leading political figure in nineteenth-century Britain. From an impoverished farming family, Cobden served a commercial apprenticeship as a clerk and commercial traveler in London before becoming a partner in a calico-printing business near Burnley, Lancashire, in 1828. Cobden's formal schooling ended at the age of fifteen, but he read widely during early adulthood, and tours of Europe, the Ottoman Empire, and the United States broadened his historical and political knowledge and his intellectual horizons. Underpinning Cobden's political philosophy was an ardent belief in Adam Smith's free-market capitalist political economy, but Cobden integrated laissez-faire economics into a broader system of thought, with the aim of promoting international peace and commercial development.

Cobden first came to public prominence as the author of two pamphlets, *England, Ireland, and America* ([1835] 2005) and *Russia* (1836) under the pseudonym "A Manchester Manufacturer." Cobden criticized the morality of British foreign policy and ridiculed Britain's obsession with maintaining the European balance of power. He called for an end to wasteful British military expenditure and damaging political and diplomatic alliances and advocated a liberal commercial policy of free trade that would foster economic development, promote British exports, and encourage international commercial exchange. This highly articulate and cogent program, with the interlinking components of free trade, reduced military

expenditure, and a noninterventionist foreign policy, remained central to Cobden's political thought throughout his life.

With the formation of the Anti-Corn-Law League in 1838, predominantly by urban industrialists and manufacturers, Cobden embarked on a new front of political activity. The Corn Laws were laws that by levying protective tariffs on foreign grain imports, raised bread prices for British consumers while protecting British farmers and landowners. As a speaker and writer, Cobden played an important role in the movement, which successfully achieved its aims with the repeal of the Corn Laws in 1846. Along with other manufacturers Cobden was accused of seeking repeal as a means of enabling manufacturers to reduce the wages of workers, but it seems unlikely that this was his prime motivation.

Cobden believed commerce should not be subject to any artificial impediments like tariffs, and in 1846 to 1847 he toured Europe, hoping to promote a wider acceptance of free-trade doctrines. As he viewed political and economic progress in terms of the harmonious economic development of nations, Cobden tied the promotion of free trade to a reduction of armaments. In his view, commerce was a civilizing and pacific influence. As free trade forged closer international commercial links, the aggressive instincts of men and nations would decline, and as the prospect of wealth arising from productive employment and manufacturing increased, the likelihood of war would diminish. Cobden therefore called for cuts in military expenditure while promoting international disarmament and arbitration as ways of curbing militarism and eradicating war. In this activity Cobden cooperated with peace societies and Quakers, and contributed toward an influential pacifist strain of thought in liberal politics.

Ultimately, Cobden's aim was the establishment of a new, peaceful form of international relations based on commercial and industrial activity rather than diplomatic and military alliances and rivalries. However, in the 1850s this vision was continually undermined by British colonial wars and territorial expansion in India and China. In Europe, the Crimean War (1854–56) pitting Britain, France, and the Ottoman Empire against Russia, unleashed a wave of British patriotic fervor. Cobden's opposition to the war was unpopular, and he lost his parliamentary seat in 1857. He returned to

political prominence in 1860 when, acting for the British government, he negotiated an Anglo-French commercial treaty, which by a mutual reduction of tariffs defused the threat of war. By doing so, the treaty validated Cobden's belief in commerce as a force for international peace.

In his later years, Cobden increasingly focused on reductions in government expenditure and nonintervention in foreign policy, issues that had first propelled him into political life. Although sympathetic to the North during the American Civil War, Cobden persistently urged British neutrality, and he continued to oppose what he regarded as the increasing militarization of British society. During his lifetime, Cobden was considered a leading figure of the advanced radicals within the Liberal Party, and after his death his ideas remained influential, especially under the Liberal governments of William Gladstone, and on the thought of John Hobson, among others. The emergence of socialism and collectivist politics in the twentieth century led to a decline in Cobden's direct influence, but many of his ideas, especially those relating to the conduct of an ethical foreign policy, retain contemporary relevance for policy makers throughout the world, and he remains a much-respected figure.

Coleridge, Samuel Taylor

Samuel Taylor Coleridge was born in Ottery St Mary, Devonshire, in 1772 and died in Highgate, near London, in 1834. He was educated at Christ's Hospital (then situated in London) and at Jesus College, Cambridge. Except for a brief period when he served in the British administration in Malta, he lived on the meager fruits of his writings, an annuity from the Wedgewood family, and the generosity of his friends. Although known primarily as a poet, Coleridge produced a significant body of political journalism, numerous political pamphlets, and a significant philosophical study of British government, *On the Constitution of Church and State* (1829).

Coleridge's earliest political writings, published in the mid-1790s, reflect contemporary preoccupations with the implications of recent revolutionary events in France and more widespread impulses of moral and social transformation associated with radical strands in dissenting Protestantism. Scholarly opinion is divided on the depth of Coleridge's political radicalism at this time. There is, however, little doubt that his identification with radical dissent, his opposition to the war with France, and his rejection of the slave trade aligned him with those who were seen by an increasingly nervous and assertive governing elite as a threat to the prevailing order.

Over the next three decades, Coleridge became a sharp critic of revolutionary and Napoleonic France and increasingly emphasized the moral significance of private property and traditional structures of ecclesiastical and political authority. In *The Friend* (1809), he argued that

political rights and institutions must be considered in relation to the historical experience of particular communities, a requirement that meant that in the unequal societies of contemporary Europe political power would reside largely in the hands of property holders. The dangers of ignoring these principles had been amply demonstrated in the recent history of France: abstract claims to political rights had destroyed the fabric of French society, exposing the entire population to the tyranny of those whose domination of the state rested on naked force. A recognition of the necessity for political inequality did not, however, undermine the fundamental equality of humanity; rather, it meant that those who wielded political power had an obligation not just to protect members of the community but to maintain conditions that made it possible for them to flourish as moral beings. This requirement played a key role in Coleridge's later writings, providing the basis of his critique of the science of political economy. In the second "Lay Sermon" of 1817, he identified its depiction of market forces with a mechanical perspective that dehumanized social relationships, effectively denied the moral personality of the working classes, and absolved both new and traditional elites of responsibility for their well-being. In response to this state of affairs, Coleridge stressed the need for institutional structures capable of sustaining moral and educational influences that addressed a comprehensive conception of human flourishing.

In *On the Constitution of Church and State*, Coleridge applied this requirement to British government. In so far as the venerated constitution in church and state corresponded to its "idea" or ultimate end, it provided a means of balancing the progressive forces of commercial wealth with the conserving tendencies of landed property. But while identifying a rationale for parliamentary government by reference to the generally beneficial interaction of different forms of personal property, Coleridge insisted on these forces being counterbalanced by an established church, whose members (the clerisy) were endowed with nonpersonal resources (the nationality) dedicated to these purposes. The clerisy was responsible for the education and moral guidance of the ordinary people and for acting on property holders so as to mitigate the tendencies to selfishness that were always attendant on private property and were heightened in communities undergoing rapid economic development.

Coleridge's political writings are significant in relation to the romantic critique of political economy that was a feature of nineteenth-century British political thought and to a sometimes-related search for intellectual and cultural influences that might be brought to bear on politics and economy in the interests of humanitarian ideals. Later writers, including Thomas Carlyle, Matthew Arnold, and John Stuart Mill, advanced claims about the role of intellectuals that were related to Coleridge's account of the clerisy. The fact that Coleridge managed to present an image of the Church of England as an established church that was not heavily encumbered by either Anglican dogma or by identification with the interests of secular elites, gave the idea of the clerisy and other aspects of his mature political thought a critical edge that was lacking in the work of other admirers of the traditional constitution in church and state.

Collingwood, Robin George

The philosophy of R. G. (Robin George) Collingwood (1889–1943) is at its best stimulating in argument and elegant in expression. It is also frequently subtle in analysis and can be radical in its claims. A polymath by temperament and education, Collingwood was disturbed by the intellectual narrowness and pedantry that he saw as the defining features of twentieth-century thought. It is not surprising that Georg Wilhelm Friedrich Hegel and John Ruskin, the main influences on his outlook on life, took as he did the unity of thought and action as their guiding ideal. Specific influences on his political thought include Thomas Hill Green and the Italian political philosopher Guido de Ruggiero, whose work Collingwood translated and admired.

Collingwood's reputation in philosophy rests largely on his philosophy of history and his aesthetics. His arguments defending history as a body of autonomous knowledge and his view that art is a form of expression are both grounded in practical experience. So a theory of human activity must start from practice, its aim being to reveal the criterion implicit in each of the different ways through which we understand the world and act in it. *Speculum Mentis* (1924) shows this procedure in action. The business of philosophy is to exhibit the logic immanent in human experience. Art, religion, science, history, and philosophy, together with their associated modes of activity, are both distinct and hierarchically related. While not a work of political thought, *Speculum Mentis* anticipates many of Collingwood's later and characteristic political ideas. Overall, it was a call

to order after the upheavals of World War I, warning against the neglect of philosophy and history by pointing to the dangers of approaching the world entirely from the standpoint of natural science. That Collingwood saw a connection between the uncritical application of natural science and the military stalemate on the western front during World War I is clear from his *An Autobiography* (1939), which also reflects his despair at the decline of liberalism as a form of practical politics and as a humane philosophy of civilization and culture. *Speculum Mentis* announces Collingwood's aim of restating the principles of a liberal way of life for a society that is increasingly losing its faith in them.

Economics and politics as branches of human experience distinct from morality and religion are systematically elucidated throughout the 1920s in articles such as "Economics as a Philosophical Science" (1925) and "Political Action" (1928). Here, economics, politics, and morality are distinguished in terms of utility, order, and duty, and politics is the realm of order based not on a command theory of political obligation but on membership of a community in which freedom and authority are reconciled. Collingwood's writings on economics have a similar aim, reflecting his belief that economics, like all human activities, has its own rationale. Yet he locates the boundaries of the state in relation to the market not in market forces alone or by a doctrinaire socialism but by a concept of civility that in *The New Leviathan* (1942) he makes the mainspring of his idea of political society.

Collingwood was a liberal political philosopher at a time when liberalism as a set of practical political ideas was in retreat. This retreat gave him the impetus to postulate a new basis for liberalism that drew on his innovative approach to philosophical method and history. Rejecting utilitarianism and social contract as complete accounts of politics, Collingwood developed a philosophy of politics grounded in human consciousness: politics is not a self-sufficient activity, but is continually looking beyond itself to the Christian ideals of civilization for replenishment and support. So through political education and the artifices of democratic rule, barbarism can be mitigated, if not entirely avoided.

The reconciliation of philosophy, history, and politics was Collingwood's overall ambition. Toward the end of his life, illness forced him to give up his work on history to write *The New Leviathan*, his attempt to bring Thomas Hobbes up to date and his major work in political philosophy. The impact of Collingwood's work on the history of political thought has been considerable. Key doctrines in his philosophy of history have lent support to the idea that political texts cannot provide answers to timeless questions but are best read in their historical context and in the light of their intellectual assumptions. For political philosophers wary of justice as an organizing political ideal Collingwood's stress on civility provides a welcome note of caution, although for contemporary liberals who prefer their ideal of social justice undiluted Collingwood's liberalism remains firmly of its time.

Communism, Varieties of

Communism is an economic, moral, social, and cultural doctrine centered on the accomplishment of radical transformative ends. With its universalistic goals, eschatological promises, and totalizing ambitions, it has often been described as a political or secular religion. The ultimate purpose of communism is to create a new civilization founded upon a New Man (by which Marx and early followers did not mean only males). Two factors were fundamental for this doctrine: the privileged role of the Party and the revolutionary transformation of human nature. Communism advanced a new conception about human existence (society, economy, social and individual psychology, art). According to it, building the New Man was the supreme finality of political action. Communism's ambition has been to transcend traditional morality, yet it has suffered from moral relativism. It assigned to the party-state its own morality, granting only to it the right to define the meaning and ultimate aim of human existence. The state became the supreme and absolute value within the framework of an eschatological doctrine of revolution. Through the cult of absolute unity along the path to salvation by knowledge of history, communism produced a new, total social and political project centered on purifying the body of the communities that fell under its ideological spell. Its revolutionary project was total and totalizing. As a potent political myth, communism promised immanent deliverance, the chance to achieve prosperity, freedom, and equality. In fact, throughout the twentieth century, the communist

Weltanschauung became the foundation for ideologically based totalitarian political experiments that resulted in terrible human costs.

Origins with Karl Marx and Friedrich Engels

Communism as a global modern revolutionary doctrine, in fact a political religion, was founded by Karl Marx and Friedrich Engels. Marxism was first and foremost a demiurgic attempt to get rid of an abhorred bourgeois order based on market relations (private property), to overcome its reified social relations, and to organize revolutionary social forces for the ultimate confrontation that would result into the “leap from the kingdom of necessity into the kingdom of freedom.” Marx strongly distinguished his revolutionary thought from other versions of socialism (Christian, reactionary-feudal, petty-bourgeois, critical-utopian). Marx’s ambitious radical vision was linked to his firm belief, especially after 1845, that he was in possession of true and correct knowledge (the postulate of epistemic infallibility), considering that his *weltanschauung* was essentially scientific—that is, nonutopian. For Marx, the conviction that history was governed by laws meant that once these laws were grasped, reason (thought) and revolution (action) could coincide in the global proletarian liberating upheaval.

One of the essential texts of this doctrine was *The Communist Manifesto*, published in February 1848. It stated that the proletariat was the chosen class of history, the long-expected redeemer that would restore the lost unity of the human species (*Gattungswesen*). Its fundamental thesis was the centrality of class struggle (historical violence) in the development of society. For Marx (and later for twentieth-century Marxist philosophers Antonio Gramsci and György Lukàcs), the revolutionary class symbolized the viewpoint of totality, thereby creating the epistemic premises for acceding historical truth. In the name of proletarian (authentic) democracy, formal liberties could be suspended, even suppressed. Marx’s myth of the Messiah-class, the heart of communism, nurtured a revolutionary project imbued with a sense of prophetic mission and charismatic-heroic predestination. Marx gave an ultimate apocalyptic verdict: since the bourgeoisie is guilty of the barbarous distortion of human life, it deserved

its fate. The proletariat was historically and morally bound to be its gravedigger.

Marx viewed the social universe primarily (but not only) in terms of social and economic determinism. Freedom meant for Marx and his disciples “understood necessity”—that is, efforts to carry out the presumed goals of history. All human reality was subordinated to the dialectical laws of development, and history was projected into a sovereign entity, whose diktat was beyond any human questioning. He declared his social theory the ultimate scientific formula. Not to recognize its validity was, for Marx, as for his communist successors, evidence of historical blindness, ideological bias, or false consciousness. At the opposite pole, the proletarian viewpoint, celebrated by Marx and crystallized in the form of historical materialism, was thought to provide ultimate knowledge and the recipe for universal happiness.

The ingredient that allowed the realization of the revolutionary mission was revolutionary class consciousness. Through it, humankind’s prehistory would end, and thus, its real history could begin. For Marx, class consciousness was an organic result of the political and ideological development of the proletariat. According to Engels (2013), for example, “The German proletariat was the heir of classical German philosophy.” Young Marx believed that there was a dialectical relationship, and therefore mutually binding, between the critique of weapons and the weapon of the critique in the process of overcoming of philosophy—*Aufhebung*. The revolutionary intellectuals were those who created the doctrine, but the proletarians were not perceived as an amorphous mass toward which a self-appointed group of teachers had the duty of injecting the consciousness of the historical truth. Nevertheless, Marx’s (1978, 143) eleventh “Thesis on Feuerbach” best expressed the novel transformational ethos of communism: “The philosophers have only *interpreted* the world, in various ways, the point, however, is to *change* it.” Marxian thought consecrated a capacious vision of historical development: with the rubble of the past cleared away, the chosen agent of history would point the way to a new society that would bring about the complete fulfillment of the human spirit.

Marxism perceived itself as science not ethics, and therefore, the revolution it preached about was “part of a historical mechanism: hence, purged of values” (Weber 1974, 23). This prophetic claim led to fanatic, almost mystical belief on the part of its followers, those who embraced the apocalyptic and chiliastic vision of communism’s algebra of revolution. Thus, communism was simultaneously an eschatology (a doctrine of mundane salvation) and an ecclesiology (a ideology of the revolutionary party/movement). Reality as it stood was irreparably reified and it was to be superseded, on the one hand, by the emancipation and revolution of the proletariat, and on the other hand, by the utopia of the classless society. Subsequently, communism’s vision of the future society relied upon a dictatorship over needs. It presupposed the dissolution of the autonomous individual within the all-devouring framework of total control, the disastrous politicization of the psyche, the manipulation of the subjective field, the attempted obliteration of the private sphere as an ultimate sanctuary of the ego. Communism aimed not only at the domination of the body politic, but also over the biological stock of society. It was a total experiment of social engineering. Once it constructed its vision of modernity on the principle of a chosen, socially homogenized community crossing the desert of history from darkness into light, there could be only one solution for those who failed to qualify to their inclusionary criteria: stigmatization, elimination, and most extremely, extermination.

The Marxist eschatology was a form of rationalized theodicy: God was replaced by history, or indeed History. History had only one direction as it unfolded from limited to absolute freedom. Freedom, in its turn, was understood as overcoming necessity. The kingdom of necessity was the realm where economy could not ensure full equality among human beings, where the political was dependent on partisan interests, and the social was atomized. In contrast, the kingdom of freedom was the realm where there was an identity between existence and essence. In this context, human existence could fully reach its development, and the condition for the freedom of all lay in each individual’s liberation. At the basis of communism, therefore, lay a teleological fundamentalism. The final station of it was the City of God on earth—that is, the triumph of the proletariat.

Vladimir Ilyich Lenin Develops a Party-Focused Communism

The main difficulty with the Marxian project was its lack of sensitivity to the psychological makeup of mankind. With its cult of totality, Marxian social theory, which purported to be the ultimate explanatory archetype, set the stage for its degeneration, in Bolshevik (Leninist) translation, into dogma and the ruthless persecution of the heretics. Marx's emphasis on human emancipation as the conscious absorption of society by the individual, his equation of social antagonisms with class conflict resulted in an advocacy of the elimination of intermediaries (laws, institutions, etc.) regulating the relationship between civil society and the state. Marx failed to give instructions on the achievement of social unity. The utopian, eschatological vision of Marx's body of political thought was translated into a revolutionary program of action by Vladimir Ilyich Lenin (born Ulianov). Such discrepancy left the field open for Lenin's creative understanding of necessity that led to the Bolshevik version of man's salvation. In Lenin's vision, the monolithic vanguard party became the repository of human hope, a tightly knit fraternity of illuminated militants and therefore the true vehicle of human freedom. The combination of Marxism and party-power set the communist body politic on the path to self-purification (permanent purge and socialist offensive).

Lenin was a Russian revolutionary, founder of the Bolshevik Party and of the Soviet Union. He was born in April 1870 to a middle-class family and died in January 1924 as the undisputed party and state leader of the USSR. Under Lenin's guidance, the Bolshevik Party organized the October 1917 revolution against the government of the Russian Empire and established the one-party authoritarian system that came to an end in December 1991. As a teenager, Lenin was deeply affected by the execution of his older brother for his involvement in an anti-Czarist plot and, as a law student, became involved in underground revolutionary activities for which he suffered arrests and deportations. Unhappy with the lack of radicalism among his fellow social democrats, Lenin advocated the need to create a new type of political revolutionary movement. His vision of the new type of party was formulated in the pamphlet *What Is to Be Done* (1902) that

articulated the Leninist concept of revolutionary practice in the twentieth century. Lenin's notion of the party led to the split within Russian social democracy between the moderates (Mensheviks) and radicals (Bolsheviks). Leninism (also called Bolshevism) consists fundamentally of Lenin's theory of the vanguard revolutionary party, the doctrine of proletarian revolution in the age of imperialism, and the emphasis on the dictatorship of the proletariat as the new form of state emerging from the collapse of the old, bourgeois order.

Lenin's endeavors were primarily in the field of revolutionary politics and the construction of a revolutionary organization that would be able to coordinate and direct the efforts of the working class to seize power, smash the old state machine, and build a classless, communist society. From the very outset, the Leninist regime was based on violence and repression against any form of political opposition. These authoritarian features of Leninism were further exacerbated by Joseph Stalin, who transformed the Soviet Union into a totalitarian state. Bolshevik humanism was conditioned only by the success of the cause it was engaged in. The individual's existence maintained its weight in the world insofar as it contributed to the construction of social Utopia. Lenin's understanding of morality was based on a principle formulated by nineteenth-century Russian revolutionary Sergei Nechaev (1960, 365) in his *Catechism of the Revolutionary*: "Everything is moral which assists the triumph of the revolution. Immoral and criminal is everything which stands in his way."

Leninism was therefore based on what T. H. Rigby has called a "goal rationality." It presupposed a radically utilitarian transformist conception of politics ultimately materialized in the divinization of a mythical party-state holding the right of life and death over its subjects.

For Lenin, the fate of the communist revolution predicted by Marx depended on the maturity and political will of the revolutionary party. When Lenin started his political career, social democrats throughout the world were grouped within the Second International. The Marxism of this international association rejected revolutionary means of overthrowing the established order and emphasized the role of evolutionary reforms. Lenin found this approach too moderate. He thought that left to itself, the working

class would never engage in an overall revolutionary upheaval to destroy capitalism. Like Marx, Lenin saw the proletarian revolution as a global phenomenon, but he modified some basic tenets of the Marxist theory. Lenin noticed the passivity of the workers in the advanced industrial countries and explained it as the ability of the bourgeoisie to co-opt the working class within the system. It was therefore important to create a new type of political party that would refuse any form of collusion with the existing dominant forces and would eventually exert exclusive political power. For Lenin, a tightly knit, phalanx-like revolutionary organization, structured almost like a military order, was needed to inject revolutionary consciousness into the proletariat and direct the workers in the revolutionary battles. The Party appeared as the embodiment of historical reason and militants were expected to carry out its orders without any hesitation or reservation. Discipline, secrecy, and rigid hierarchy were essential for such a party especially under conditions of clandestine activities (like those in Russia). The main role of the Party was to awaken the proletarian self-consciousness and instill the revolutionary doctrine (faith) into the dormant proletariat. Instead of relying on the spontaneous development of consciousness in the working class, Leninism saw the Party as a catalytic agent bringing revolutionary knowledge, will, and organization to the exploited masses: “Without a revolutionary theory . . . there can be no revolutionary movement.” It was with Lenin that the mystique of the Party of a new type became a feature of radical politics in the twentieth century. The Party was the historical agent for it encompassed the professional revolutionaries, those who, by reuniting their acting and thinking faculties, regained “the grace of the harmonious original being” (Halfin 2000, 14).

Ideological absolutism, sacralization of the ultimate goal, suspension of critical faculties, and the cult of the party line as the perfect expression of the general will were embedded in the original Bolshevik project. Lenin imposed two fundamental elements on the Bolshevik conception of politics: law as an epiphenomenon of revolutionary morals and the heteronomy of individual action. The annihilation of democracy within the Leninist practice is determined by the nature of the Party as a secular substitute for the unifying totalizing mystique in the political body of the absolute sovereign (the medieval king). In other words, the Leninist model asserts

the integral homogenization of the social space as a political and pragmatic ideal. Ideology cuts across all regime dynamics, “grounding and projecting action, without which governance, violence, and socialization become impossible” (Geyer 2009, 28). Lenin revised the classic Marxist theory regarding the location of the revolutionary center in the advanced capitalist West. In one of his most influential writings, *Imperialism, the Highest Stage of Capitalism*, Lenin argued that a new and final stage of capitalism had emerged in which monopoly replaced competition, the concentration of capital reached its climax, and war between capitalist powers had become inevitable. For Lenin, imperialism was guilty of the unspeakable horrors of the world war. The capitalist world system was bound to break down, but this collapse, Lenin maintained, would first occur at the weakest links of the imperialist chain, in the East rather than in the West. Backward Russia, with its insoluble social and economic contradictions, appeared as the country where the revolution could first triumph. The masses were profoundly dissatisfied with the old order, outraged by the costs of war, and ready to engage in revolutionary upheaval. The Russian bourgeoisie was weak enough not to be able to oppose decisive resistance to the radicalized masses, and the proletariat was developed enough to become class conscious thanks to the selfless activities of the Bolshevik party.

In his work *State and Revolution* written in 1917, a few months before the Bolsheviks came to power, Lenin argued that the militaristic-bureaucratic state machine of the bourgeoisie had to be overthrown and replaced by revolutionary councils (organs of direct, participatory democracy). Later, as the new Soviet state was confronted with starvation, poverty, resistance of the White Guards, and foreign intervention, Lenin developed his theory of the dictatorship of the proletariat by which he understood a political regime in which the centralized authority was exerted by the party-state administrative agencies. The initial drive toward democracy from below and self-empowerment of the masses was replaced by emphasis on the reconstructed state machine that according to Lenin was indispensable for defending the revolution and pursuing its main goals.

True, Lenin saw this as a temporary stage and he never resigned himself to the idea that the Russian Revolution would be not only the first, but the sole proletarian revolution for decades to come.

One of the most acerbic reactions to Lenin's vision of a dictatorship of the proletariat and conception of the monolithic, vanguard party came from the Polish-German Marxist thinker Rosa Luxemburg (1871–1919) in her manuscript notes on the Russian Revolution. She famously commented on the non-negotiable value of freedom: "Freedom only for supporters of the government, only for members of the single party, however numerous—this is not freedom. Freedom must always be for those who think differently" (quoted in Kolakowski 2005, 422). Rosa Luxemburg (1997, 370; emphasis added) anticipated the path taken by the Bolsheviks toward the totalization of power when she wrote that the development of their revolution "moves naturally in an ascending line: from moderate beginnings to ever- greater radicalization of aims and, parallel with that, from a coalition of classes and parties to the *sole rule of the radical party*." This was the origin of the major conflicts between Lenin and Luxemburg and one of the main distinctions between Soviet and Western Marxism. Luxemburg cofounded with German socialists an antiwar organization Spartakusbund (*Spartacus League*), which organized an armed uprising in the aftermath of the German defeat in World War I. The revolt was crushed, and Luxemburg was captured and later executed.

From Stalin to the Fall of Communism

The restoration of state prerogatives was for Lenin a necessary evil, and he tried to justify the notion of a proletarian dictatorship by defining it as the dictatorship of the majority of the population (poor peasants included), and therefore not exactly a dictatorship. In form, Lenin said, this was a dictatorship, but in substance, because it represented the interests and aspirations of the large majority of the population, it was the true, substantive democracy. Later, Stalin would transform every single feature of Lenin's concept of the dictatorship of the proletariat into a dogma to justify his highly repressive and terrorist regime. This transformation was possible because Lenin's concept of the dictatorship of the proletariat was his contempt for the state of law: "The revolutionary dictatorship of the proletariat," Lenin wrote in 1918, "is power won and maintained by the violence of the proletariat against the bourgeoisie, power that is unrestricted by any laws." Lenin was convinced, however, that these temporary exceptional measures, including persecution of dissidents and banning of all

political parties but the Bolsheviks, were needed for the survival of the revolution in Russia. In the long run, however, he hoped that the revolution would triumph in the West and a certain political and economic relaxation would become possible. His New Economic Policy, inaugurated in 1921, indicated Lenin's readiness to jettison the initial utopian economic vision and allow for a mixed economy (with significant elements of market in addition to state control over industry, foreign trade, and banks). Lenin's last struggle, one that coincided with the dramatic deterioration of his health, opposed the ailing leader to Stalin's growing despotism. In his last writings, Lenin asked for Stalin to be removed from the position of general secretary, but his behest went unheeded by the Bolshevik elite. Stalin was already controlling the party-state apparatus and postured as Lenin's most faithful disciple.

Following Lenin's demise, a fierce struggle took place among Bolshevik leaders. Eventually, by 1929, Stalin triumphed over his opponents and initiated the revolution from above, creating a post-Leninist, truly Stalinist party and an extremely centralized, ideologically driven tyranny. The seeds of Stalin's regime, however, had been sown by Lenin. Indeed, Stalin created no new institution and added no significant chapter to Leninism. He carried to an extreme Leninism's intolerant logic and turned the Union of Soviet Socialist Republics into a police state. The Communist Party was transformed from a revolutionary elite into a bureaucratic caste whose sole aim was to preserve and enhance the leader's power and its privileges. Gradually, the dictatorship of the proletariat became an empty slogan legitimizing Stalin's absolute reign and secret police repression against the population. Invoking Lenin's struggle against factionalism, Stalin completely destroyed any intraparty democracy, viciously persecuted all (real or imaginary) opponents and imposed a monolithic dictatorship based on permanent purges and mass terror. In the physical absence of Lenin, the numinous leader incarnating the absolute power of the party, the "imagined community of Leninist disciples" (Riegel 2005, 104) had to reinvent itself by means of founding its charisma on the scriptures of its founding fathers. The invented tradition of Marxism-Leninism was then thrust upon the party ranks as a means of stabilizing the normative identity of the party. The return to Leninism became an important theme of the anti-Stalin opposition, especially among Trotsky's supporters. Later, after Stalin's death in 1953,

Nikita Khrushchev proclaimed the restoration of the Leninist norms of party life and denounced Stalin's "cult of personality" (i.e., the quasi-religious adoration of the supreme leader) as non-Leninist. In the 1980s, Mikhail Gorbachev deepened Khrushchev's critique of Stalinism and sought to instill pluralism within Soviet institutions. In his democratizing efforts, Gorbachev went beyond the logic of Leninism and abandoned both the concept of the dictatorship of the proletariat and the Party's claim to monopoly of power.

In 1919, Lenin created the Third (Communist) International—the Comintern. Earlier he had lambasted the Second International for its loss of revolutionary fervor and complicity with bourgeois parliaments and governments. The Comintern consecrated Moscow's centrality and hegemonic role within world communism. For a party to be accepted into Comintern, it had to unconditionally acquiesce in twenty-one conditions, including the complete subordination to Soviet dictates. Lenin created the Comintern as an instrument for expanding the revolution and allowing Soviet Russia to escape imperialist encirclement. Later, Stalin transformed it into a mere instrument of Soviet foreign policy and by implication Russian imperialism. The Comintern was disbanded in 1943, but communist parties continued to toe the Stalinist line. In the aftermath of World War II, Leninist parties came to power in east-central Europe, China, North Korea, and North Vietnam (a Soviet-style regime existed in Mongolia since the 1920s). Later, in 1960, Fidel Castro publicly espoused Leninism and proclaimed the communist nature of the Cuban revolution. In all these cases, communism represented the sum of political and ideological techniques (tactics) used by revolutionary parties to seize and consolidate monopolistic dictatorial regimes. Historian Martin Malia correctly branded communist systems as *partocratic ideocracies*. Their only claim to legitimacy derived from the organized belief structure shared by the elites and inculcated into the masses according to which the party was the sole beneficiary of direct access to historical truth.

Lenin modified Marxism in that he assigned the revolutionary role to the vanguard party rather than the proletarian class itself, he saw the outbreak of revolution in a less rather than more advanced country (Russia, not Western Europe), and made the dictatorship of the proletariat the core of his

theory of the communist state. In brief, thanks to Lenin's contribution to the Russianization of Marxism, Leninism represents a synthesis between Western, social democratic values and the Russian traditions of revolutionary violence. Lev Trotsky (born Bronstein) was another major Russian revolutionary who was initially opposed to Lenin's dictatorial propensities. During the October 1917 revolution, Trotsky became Lenin's closest political associate and served as the first Bolshevik minister (people's commissar) of defense and foreign affairs. Later, after Lenin's death, he defended revolutionary Leninism against Stalin. Trotsky accused Stalin of abandoning the international proletariat by focusing exclusively on building socialism within the USSR and of destroying any trace of democracy within the Leninist party. Less theoretically gifted than Lenin or Trotsky, Stalin codified and overly simplified Leninism, adjusting it to the needs and expectations of the average party bureaucracy. Instead of a revolutionary doctrine, Stalin's Leninism was just a means of legitimization for the party bureaucracy's exercise of power. Mao Zedong was a Chinese communist leader who adapted the main tenets of Leninism to China's conditions. Recognizing the weakness of the Chinese proletariat, Mao developed Lenin's theory of the revolutionary dictatorship of workers and peasants and brought the Chinese communists to power in 1949. Mao criticized Khrushchev for having renounced some of the basic Stalinist tenets, including the idea that class struggle continued and intensified under the conditions of the dictatorship of the proletariat. Third World revolutionary elites identified themselves with Mao's passionate anti-imperialism and anticapitalism, as well as with the theory of rural guerrilla warfare. After Mao's death, in the context of the crisis of communist ideology and of the collapse of communist regimes in Europe, his interpretation of Marxism-Leninism was supplanted by state-encouraged market commitment, by nationalism, and by the idea of a harmonious society. The one constant dogma of Chinese communism is the monopoly of power by the Communist Party. In North Korea, the shock of 1989 in Europe generated increased autarky based on the doctrine of Military-First Politics and on *juche* (self-reliance) ideology that ensured continued totalitarian social control and rabid nationalism. Cuba has also complemented communism with anti-American nationalism in order to revitalize the regime's ideological legitimacy.

Marx proclaimed communism to be the genuine resolution of the conflict between man and nature and between man and man: “Communism is the riddle of history solved, and knows itself to be the solution.” The explanation for the exemplary fate and consequences of this doctrine is dependent on a few essential factors: the vision of its followers—a superior elite whose utopian goals sanctify the most barbaric methods; the denial of the right to life to those who are defined as degenerate parasites and predators, the deliberate dehumanization of state-defined enemies-victims; and what French historian Alain Besançon correctly identified as the ideological perversity at the heart of totalitarian thinking: the falsification of the idea of good (*la falsification du bien*). Communism attempted to encompass and filter through its ideological matrix all that had potential for public discourse. It tried to control and mediate any self-defining narrative. It created a “new type of cultural hegemony,” which aimed to carry out what Roger Griffin (2006, 93) called “an ‘anthropological revolution’ through the use of an essentially ritualistic and transformative politics.” Gorbachev’s reforms (known as *glasnost* and *perestroika*) aimed at rationalizing the Soviet system, injecting new life into Leninist institutions, streamlining the economy, condemning Stalinist atrocities, and restoring the original Bolshevik ideological enthusiasm. In fact, he resumed previous experiences meant to humanize socialism (the Hungarian Revolution, the Prague Spring, Marxism revisionism in Poland and Yugoslavia).

In Eastern Europe, there were several waves of revisionism represented by several Marxist humanist thinkers who advocated a moral rebirth of socialism that would allow moving away from the terror-tainted legitimacy of Soviet communism. This movement had been anticipated by Yugoslav theorists (the Praxis group) who felt compelled, by the very logic of the political conflict with the Soviet Stalinist elite, to rediscover the initial impulses of Marxist anthropology, sociology, and philosophy. Those most active, however, in the struggle against Stalinist obscurantism were Hungarian and Polish intellectuals, the exponents of a radical political outlook that inflamed the masses throughout the hectic months after the Twentieth Congress of the Communist Party of the Soviet Union. The favorite theme in the discourses of East European philosophers, sociologists, and men of letters in general was the return to an idealized Marx: the attempt to detect those elements in Marx’s original design that

could justify the politically liberating changes within the system. Moreover, that endeavor was conceived as a rediscovery and reinterpretation of Marx's early works, of the whole Marxian philosophical legacy detested by the Stalinist ideologues. The concept of alienation became the basis of the most impassioned philosophical controversies, fostered the case for liberalization, and provided the theoretical basis for political criticism. With the Soviet military invasion in Hungary (1956) and Czechoslovakia (1968), this current in Eastern European Marxism gradually gave way to the intellectual phenomenon of dissent, spearheaded by personalities such as Václav Havel, Adam Michnik, Agnes Heller, or Miklós Haraszti. The latter were the thinkers behind the revival of civil society that led to the upheaval of 1989.

The revolutions of 1989 demonstrated that communism had exhausted its appeals and led to the breakdown of the Leninist regimes in east-central Europe. In December 1991, the USSR came to an end. The demise of communism in Europe generated the space for alternative political mythologies, which determined a proliferation of what might be termed fantasies of salvation: ideological surrogates whose principal function was to unify the public discourse and provide citizens with an easily recognizable source of identity as a part of a vaguely defined ethnic (or political) community. One can conclude by quoting Polish philosopher Leszek Kołakowski (2005, 1212), an intellectual who experienced both the seduction of Marxism and the bitter disenchantment with its practical applications: "The self-deification of mankind, to which Marxism gave philosophical expression, has ended in the same way as all such attempts, whether individual or collective: it has revealed itself as the farcical aspect of human bondage."

Communitarianism and Liberalism

The 1980s witnessed a determined assault on liberal political theory, in particular, the neutrality liberalism of John Rawls and Ronald Dworkin and by communitarian thinkers, such as Amitai Etzioni, Alasdair MacIntyre, Michael Sandel, Charles Taylor, and Michael Walzer. In general, communitarians believe that contemporary liberal democracies are too individualistic, atomized, and lacking in shared values. They see this state of affairs as aided and abetted by liberal political theory, which neglects the role and value of community both as something to be valued and as a generator of values. The central liberal error is to conceive of individuals as identifiable in isolation from the communities that form them. This conception leads to an excessive emphasis on individual rights, liberties, and autonomy and to a corresponding neglect of the values and identity that people have in common. Morality and politics are in any case always oriented to some conception of the good, and consequently the Rawlsian liberal ideal of a state that is neutral among conceptions of the good is strictly impossible as well as undesirable. Rather, we should be pursuing a politics of the common good.

Within this broad commonality, communitarianism encompasses a range of views—indeed, not all of those who have been classified as communitarians have been happy to accept that label. All communitarians tend to be critical of liberalism, but some more so than others. At the strong end of communitarianism in this regard, MacIntyre and Sandel have been highly critical of liberalism, while Taylor's and Walzer's views are more

conciliatory. There are also ideological differences among communitarians, with identifiably conservative, socialist, and liberal variants.

It is also worth noting that the liberal-communitarian debate of the 1980s is to some extent an echo of earlier and larger philosophical disputes. The differences between liberal universalism and communitarian particularism were rehearsed by the followers of Immanuel Kant and Georg Wilhelm Friedrich Hegel at the turn of the 19th century. That contest, in turn, reflects the perennial tension between universalism and relativism in ethics.

The remainder of this entry is divided into three parts: first, an outline of the communitarian critique of liberalism; second, a review of liberal responses to that critique; and third, a brief note on the status of the debate now.

The Communitarian Critique of Liberalism

Communitarians believe that liberal thinking neglects community in two main ways: as a source of value, and as an object of value. The first of these concerns addresses the question of where our values come from. According to communitarians, liberals falsely suppose that people choose their values freely as if from a supermarket shelf—hence, the excessive liberal emphasis on personal autonomy. This liberal picture is reinforced at the level of theory by views such as Rawls's theory of justice, which begins by imagining people choosing principles of justice from an original position in which their identifying features and conceptions of the good are screened off by a veil of ignorance.

While the purpose of Rawls's original position is to model the notion of impartiality, communitarians such as Sandel argue that the Rawlsian strategy depends on a false and incoherent conception of the human person as self prior to its ends—that is, a notion of persons as in some sense separable from the particular characteristics, including values, language, and culture that make them who they are. This metaphysical or Kantian notion of the self, Sandel (1982, 179) argues, makes no sense; it is “to imagine a person wholly without character, without moral depth.” The truth is that people are intimately identified with the communities in which they are brought up and in which they live. The self is not atomistic, but rather it

is situated in a community or encumbered or constituted by its communal identity.

Moreover, the communitarians argue, liberal atomism connects with the equally dubious doctrine of liberal neutrality. If the individual could be conceived independently of any particular conception of the good, then so too could the state. In fact, however, neither is possible. Despite liberal protestations, the liberal state turns out to be identified, like the liberal person, by a distinctively liberal conception of the good focused on values such as personal autonomy.

The second main problem with liberalism is that it neglects community as a value in itself. The individualism that characterizes modern liberal democracies leaves such societies without adequate sources of unity—in particular without a sufficiently substantial set of shared values. Thus, Etzioni laments a social arena in which previously accepted standards have been undermined but not replaced with anything except a profusion of personal lifestyle choices. “The result,” writes Etzioni (1995, 24), “is rampant moral confusion and social anarchy,” and what is needed is the reassertion of a common morality: “To return to a society in which certain actions are viewed as beyond the pale.”

Liberal Responses to Communitarianism

The communitarian critique has been countered by some vigorous liberal responses. Even within communitarian ranks, doubts and qualifications have emerged over time. Walzer, for example, has pointed to a major tension between the claim that liberal accounts of atomized selves misdescribe social reality and the claim that community is undervalued in liberal societies, tension suggests that such societies really are atomistic. Liberals would add that both claims are exaggerated.

First, most liberals would deny that they hold an atomistic conception of the individual self, and they would argue that the communitarian criticism on this score misses the point. The liberal point is not that the self is an isolated metaphysical entity detached from all identifying particulars, but that we should see individual human beings as having a capacity for personal

autonomy—that is, for being able to take a critically reflective view of their own cultural, moral, and other attachments. This autonomy need not be thought of as involving a person's detaching herself from all of her commitments simultaneously—that really would be inconceivable. Rather, liberals say that people are capable of piecemeal questioning of their own values and commitments by asking themselves how well these cohere with their other values and commitments, which may include universal considerations. History and one's own personal experience are full of cases in which people have revised their beliefs, values, and identities through critical reflection.

Second, liberals would resist the claim that they fail to appreciate the benefits of communal belonging. For one thing, the basic liberal commitment to freedom of association and expression implies the importance that all liberals attach to communities whose membership is voluntary: churches, sports clubs, professional bodies, and so forth. In the case of communities in which membership is not chosen—cultural groups, for example—the matter is more complicated since groups of this kind sometimes restrict the freedom of their individual members in ways that put them at odds with the fundamental principles of liberalism. But again, it is far too simple to say that liberalism is unable to value this kind of group membership at all. Will Kymlicka, for example, has argued that cultural membership is just as fundamental to the well-being of individuals as are individual rights and economic resources.

More generally, liberals do care about social unity, if only because liberal states rest their legitimacy on their citizens' consent. Liberalism is not founded on moral skepticism, but on a reasoned commitment to a core set of values, including individual liberty and toleration. Consequently, liberal theory seeks to justify consensus on the privileging of these values at the very least. Thus, liberals do after all subscribe to a notion of the common good, although this will be founded on, as Rawls puts it, a thin theory of the good that leaves room for people to differ when it comes to the thick details.

If liberals uphold a conception of the good, then what becomes of liberal neutrality? There are two main strategies. Some liberals have been prepared

to jettison neutrality altogether and to affirm that liberalism does rest on a specifically liberal conception of the good characterized by its own set of distinctive values, such as personal autonomy or toleration (see, for example, Joseph Raz 1986 and William Galston 1991). This comprehensive liberalism is usually allied to liberal perfectionism, which means that the comprehensive liberal good may be legitimately promoted by the state. Such a regime is then justified because, even though comprehensive, it is more accommodating than the alternatives, leaving room for many different interpretations.

The route proposed by other liberals, including Rawls in his later work, is to retain the idea of neutrality but in a qualified form. In *Political Liberalism*, Rawls (1993) argues that his theory of justice should be understood as a purely political rather than comprehensive view, applying only to liberal democracies and even there requiring the allegiance of citizens only in the public sphere rather than in their private lives. This move appears to recognize that no political system can be absolutely neutral on the good, but that a degree of neutrality can be maintained, or at least aspired to, within certain parameters.

Liberals have not only sought to defend themselves against communitarian criticisms, but also have taken the offensive themselves. One obvious liberal worry about the communitarian politics of the common good is its authoritarian potential since the claims of the community, or the common good, have often, historically, come into conflict with those of individuals or minorities.

Another concern is the relativist strain in communitarianism. The starting point in communitarian moral thinking is not a universal principle but the de facto beliefs and values of some actual community. Since different communities have different beliefs and values, it appears that communitarianism tends naturally in the direction of cultural relativism. The obvious shortcoming of this approach from a liberal point of view is that the consistent communitarian, like the consistent cultural relativist, is obliged to defend as legitimate whatever the relevant community believes to be legitimate, no matter how unjust or unethical this may be from the perspective of human rights and freedoms.

Finally, when we refer to the relevant community, which community do we mean? The idea of community is highly ambiguous between different kinds and levels of commonality. Different visions of community are upheld by rival communitarian thinkers, yielding competing communitarian ideologies: traditional communities are commended by conservatives, egalitarian and participatory communities by Marxists and other radicals, and pluralist communities by liberals or centrists.

The Legacy of the Debate

Although some political theorists would no doubt disagree, many would say that the liberal-communitarian debate, at least in the form discussed here, has largely run its course. Few if any liberals would now deny that the self is to some extent situated or that communities can be valuable. On the other hand, few communitarians would now deny that communities can sometimes be oppressive or insist that persons, at any rate in modern societies, are so thoroughly situated that they are incapable of critical reflection and autonomy.

There is thus a broad consensus that each side had something to learn from the other, although which side had more to learn remains disputed. While communitarians might see their work as importantly reforming or correcting or at least supplementing liberal thought, liberals still tend to regard communitarianism as for the most part resting on misunderstanding and exaggeration and at best as reminding liberals of what they knew already.

Nevertheless, communitarian thinking has undoubtedly been influential in many areas of contemporary political thought, either through the values it advocates or the conceptual analysis it offers. In these different ways, communitarian approaches have been promoted, or at least noted, in fields as disparate as distributive justice, immigration, nationalism, feminism, and international relations.

There is one field, however, where communitarianism has had a greater impact than in any other: multiculturalism. The tension between different levels of community was noted above. In the context of multiculturalism, an

especially important tension is that between larger communities and the subcommunities within them. While the goal of the communitarians of the 1980s was usually to promote the unity of whole political societies, it soon became clear that the logic of respect for community could equally support the claims of internal minority groups. In this respect the work of Taylor (on the communitarian side) and Kymlicka (a liberal sympathetic to some communitarian themes) has served as a bridge from communitarianism to multiculturalism.

Community

The idea of community has a controversial and contested status within social and political thought. Many see it as a concept central to understanding social and political life because it draws attention to what people have in common and what binds them together. It refers also to the close social relationships surrounding individuals and their immediate families, which anchor them into the larger society. The classical conception was that it was natural for people to be embedded within such communities, which would command their most powerful personal and political loyalties. Larger societies would develop out of combinations of these local groupings, and political authority would continue to draw upon the underlying strengths of community. This argument formed part of Karl Marx's vision of precapitalist societies and is a key aspect of the thinking of the early French sociologist Émile Durkheim, who saw the weakening of community in modern society as a major political and moral problem, threatening disorder and social disintegration.

Community is unusual in almost always being viewed positively. Radicals and conservatives alike find things to applaud about it, though invariably pointing to very different examples and aspects. Along with figuring in a wide variety of political traditions and ideologies, the notion of community is employed as a practical and rhetorical expression by politicians and policy makers, as well as in everyday speech among ordinary members of society. This broad usage gives it a depth and complexity of meaning but also can make it seem vague and confusing. As a multilayered

phenomenon, community has substantive, practical, and normative connotations. It can refer to ideas of common belonging and identification, involvement in shared social relations, action undertaken together, and the possession of common goals or shared interests. While many regard community as an ideal worth pursuing, others perceive it to be a dangerous and socially reprehensible illusion. Critics condemn the notion for being incoherent, or obsolete, and defenders of community are sometimes accused of romanticism for trying to resist what others regard as irresistible forces, such as contemporary globalization.

Historical Background

The concept of community has a long philosophical history with roots at least as far back as ancient Greek conceptions of the polis, which connected membership in a political community with the rights and responsibilities of citizenship, and separated those who belonged from others who were alien, usually regarded as inferior and potentially hostile. The gradual emergence of a distinctive framework of political institutions and authority also linked questions about community to the rise of city life and to the broader development of civilization. These issues continue to fuel debates about the changing nature and relevance of community. In the late nineteenth century the German sociologist Ferdinand Tönnies classically contrasted community (*Gemeinschaft*) with society (*Gesellschaft*), making society a grander, more abstract phenomenon capable of containing a variety of communities. While encouraging a broad historical perspective that discerns a movement away from one toward the other, Tönnies also proposed that community and society, or association, represented two permanent underlying principles of social organization: one consisting of close, emotional ties between known individuals, such as might occur in a family or tribal grouping, the other indicating the more impersonal, rational relationship typical of formal associations, large organizations, and modern societies. Similar distinctions have framed the ensuing debate about community.

Following Tönnies, many analysts have adopted a historical evolutionary perspective that associates community most strongly with older, premodern or traditional societies where the individual appears to be thoroughly

enmeshed in a predetermined set of social relationships that are closely integrated, long established, and taken for granted. These organic communities are seen as exerting an overwhelming moral pressure on their members, who inevitably share very similar experiences and worldviews. Communities, therefore, appear to be marked by sameness and consensus. Sociological researchers looking for objective empirical examples of this model have usually found them to be characteristic of quite specific conditions, such as rural, small-scale, village-like social structures. Craig Calhoun's (1998, 391) comment that community life can be understood as life lived in "dense, multiplex, relatively autonomous networks of social relationships" captures this conclusion. It prompts a typical question about the applicability of community to larger-scale, more urban, and more modern social circumstances. A major theme of discussion has been the persistence of community over decades and centuries and its capacity to cope with new situations and pressures. A dominant view has been that genuine community becomes decreasingly viable under conditions of modernity and postmodernity, as it is undermined by processes of industrialization, urbanization, and the spread of formal democracy, mass media, and public opinion. Those favoring this position speak of the loss of community along with the search for new forms of community, and they often display nostalgia for the communities of the past. Yet influential contemporary theorists such as the Polish sociologist Zygmunt Bauman and the Spanish urban researcher Manuel Castells point to a paradoxical resurgence of enthusiasm for community when conditions appear particularly hostile to it, for example, in the shape of religious fundamentalism, ethnic solidarity, and certain kinds of nationalism.

Community can refer to an objectively observable social structure, a set of institutions and relationships that enable people to live together, or a more subjective quality occurring in almost any social relationship, wherever there is a feeling of belonging together or of having a common identity. The American sociologist Robert Nisbet (1967, 47) used the term *communion* to describe the sense of community present in relationships showing a high degree of "personal intimacy, emotional depth, moral commitment, social cohesion and continuity in time." This approach distances community from more calculated, short-term, and dispassionate relationships in which individuals might be considered to make less personal investment. A

substantial literature suggests that the growth of contractual relationships, spelling out the rights and obligations of the various parties involved, high levels of personal and social mobility, and a complicated division of labor all militate against the survival of traditional communities where people could know and relate to one another in a variety of different activities and respects. Instead of close personal contact within a familiar social environment, people today routinely deal with anonymous strangers, or meet only in narrow roles, in situations of change. This trend stimulates considerable debate about whether this increasing anonymity represents a harmful social transformation and about how far it may be possible to rebuild community in contexts where most relationships are limited and transitory.

Debates and Critiques

The existence of any community poses questions of political representation, the distribution of power within and around it, and ways in which members' wishes can be properly expressed. Resolving these matters can be problematic since community boundaries are not always clearly defined and can overlap or conflict with one another. Authorities must take note of the varying communities to which people belong, and political systems must facilitate their demands. For instance, the presence of geographical communities usually leads to requirements for some form of local government or administration. In addition to occurring in communities of place, such as small towns or urban neighborhoods, communal ties can develop within religious groupings, in groups defined by ethnic or cultural factors, or around social and political movements. Communities can also form within social classes. These categories all have the capability of generating powerful collective identities, shaping the views and actions of their members, and helping them work together to accomplish shared ends. Even highly structured workplaces and bureaucracies can take on aspects of community, as social ties develop between the personnel within them. Special effort may be devoted to cultivating these attributes of community and to enhancing members' motivation and loyalty to the organization, although commentators who regard spontaneous, unconscious intimacy as a sign of community may doubt the authenticity of any community that results from deliberate planning and design.

Positioned between the individual and society as a whole, communities are vulnerable to pressures from either direction. Political liberalism has sought to free individuals from the restrictions of community so as to take part in the market and make personal choices, but individualism can be destructive of community. So, too, can social collectivism, for instance, through the inflated power of the state. Later theorists have echoed Durkheim's view that intermediate groupings between individuals and society need to be maintained and strengthened to prevent excessive individualism and social alienation. During the 1950s, this danger formed part of the mass society thesis, which addressed fears that citizens of Western democracies were becoming a lonely crowd vulnerable to political manipulation and demagoguery. It has been revived more recently by influential commentators such as Amitai Etzioni and Robert Putnam and debated among a group of prominent North American political philosophers, including Charles Taylor and John Rawls. Arguments deployed for enlarging the role of community groups and voluntary associations as a way of engaging with a more active citizenship are reminiscent of the case made for the importance of civil society organizations in sustaining political democracies.

Etzioni's communitarianism advocates a middle ground between the state collectivism associated with the political left and the radical individualism of free-market neoliberalism. His Third Way brings active communities into the picture as a moral voice asserting social responsibility alongside individual rights. Opponents claim that this approach has more plausibility when applied to better-off communities but is less practicable for deprived communities starved of resources and lacking necessary skills. It has also been interpreted as a way of transferring responsibility, with associated costs, from the state to informal local groups. Putnam identifies a long-term decline in community connections in modern America, symbolized by readiness to bowl alone rather than join clubs and associations. This weakening of communal links is said to reduce people's capacity to participate in political life, as they withdraw into relatively isolated lives. Putnam has helped popularize the term *social capital* to refer to resources gained from membership in communities. The social ties that bond (within communities) and bridge (between communities) are held to be essential foundations for relationships of trust and cooperation. Putnam has shown

that television is a prime culprit in undermining social capital because viewing it keeps people inside, away from their neighbors, and much of its content makes them fearful of interacting with others.

Others find this insistence on the value of community alarming because it ignores negative consequences. They highlight a darker side, signifying social oppression and exclusion. The feminist philosopher Iris Young advocates the politics of difference, celebrating social diversity and cultural pluralism. Her ideal is a cosmopolitan world of meaningful exchanges among strangers. By contrast, community can appear collectively authoritarian, elevating similarity above difference and playing down important distinctions of class, gender, and lifestyle. The sociologist Richard Sennett writes of the destructive *Gemeinschaft* that can develop as communities become preoccupied with pursuing their own interests while drawing up boundaries that exclude others to the detriment of privacy and freedom of choice.

But communities do not necessarily imply close harmony and agreement. Social scientists researching in actual communities frequently find them to be riddled with conflict and division. British social anthropologist Anthony Cohen argues that community should be regarded as something people construct so as to talk about who does or does not belong, thereby differentiating themselves from other groups. Rather than being fixed, boundaries around communities can be negotiated and revised, according to circumstances. The political theorist Benedict Anderson suggests that people can imagine themselves to be fellow members even of very large communities, like nations. This imagination is reinforced through processes of social construction and communication. An emphasis on how people themselves conceptualize community fits well with contemporary circumstances in which membership in communities appears largely a matter of preference with people staking claims on political resources through their allegiance to different communities of interest, choice, and identity. Against the pessimistic tone of much discussion around the future of community, this voluntaristic stance opens up possibilities for all sorts of new and revived communities—of faith, lifestyle, and sexual preference—as well as virtual communities and social networks using new technologies of communication.

Comte, Auguste

Isidore Auguste Marie François Xavier Comte (1798–1857), mathematician, philosopher, social theorist, reformer, and in later years, would-be founder of a new world religion is notable in the history of thought chiefly for his grand, and somewhat eccentric, systematization of positivism.

Comte's System

Positivisme, a Comte coinage, meant more than a philosophy of science based on a methodological insistence on empirically based (positive) reasoning, though it was certainly that. A cornerstone of Comte's system was its claim to have extended scientific principles to cover the entire human domain. But positive had a political meaning, too. Positive philosophy, in contrast with the individualistic and metaphysical *négalivisme* that had come to prominence in the Revolution, was social and constructive, and underpinned a practical program for the rebuilding of post-Revolutionary France. This program was all the more practical, Comte thought, because, unlike the mystical dogmas of theists and the speculative utopias of metaphysicians, it was scientifically based and thus in tune with the real development and workings of society. *Savoir pour prévoir, à fin de pouvoir*. Not that positivism switched one epistemological absolutism for another. Eschewing the search for ultimate causes, its truths were relative, limited, in the form of scientific laws, to phenomena and their predictable

regularities. The historical necessity for such a shift in perspective was both a premise of positivist politics and a unifying proposition internal to its theory of knowledge.

Comte's *positivisme*, then, was an all-embracing and historically self-situated synthesis of knowledge, thought, and action. For Comte, moreover, the establishment and dissemination of this synthesis was a matter of great urgency. For only thus could the great crisis of French and European society be resolved by providing, on a secure epistemological footing, the mental and moral framework for the new social order that science and industry (organized work) were ushering in.

A key ingredient in Comte's system was the founding, which he claimed to have done, of a positive science of society. Sociology, or social physics as he first called it, would complete the order of the sciences, capping the development, successively, of mathematics, astronomy, physics, chemistry, and biology. This completion would make possible for the first time a philosophy of scientific knowledge as a whole and indeed, a philosophy that for the first time was itself positive in as much as sociology of the Comtean sort (nomothetic, macroscopic, historicizing) enabled us to grasp knowledge and its genesis as itself a scientifically cognizable object. Sociology would also provide a scientific basis for politics. From its laws of statics and dynamics could be derived both an objective understanding of the current crisis—seen as the pathological prolongation of a difficult and conflictual transition—and an orientating model of what, when fully emerged, the normal form of industrial society would be.

Social statics concerned the interrelation of institutions within any given configuration and the binding of individuals into groups. Comte followed Catholic conservatives such as Joseph-Marie de Maistre and Louis de Bonald in stressing hierarchy and corporateness and generally having an organicist view of the social totality. A society was, however, an organism of organisms like a giant polyp, and given the natural (though educable) preponderance of the egoistic instincts over the social and altruistic ones, which Comte linked to the physiology of the brain, the integration of that totality was always problematic. Hence, the problem—prominent in

classical French sociology—of the relation of individual and society, and of the social tie.

In his earlier writings, Comte stressed the importance for social order of overarching systems of belief and knowledge. He later complemented this work with a detailed account of the affective dimension, highlighting the cultivation of altruistic sentiments, successively, within family, tribe, nation, and humanity. What secured the requisite unity of hearts and minds overall, however, was religion, together with its apparatus of education, worship, and moral regulation. Religion here was defined in terms of its reproductive (rebinding) function, rather than with reference to any suprasensible deity and its particular form and content was conceived as a historical variable, dependent on the interlinked state of knowledge and production.

The cardinal principle of social dynamics was the law of three stages. This law held that collective mental development followed the logic of individual mental development, passing from an infant stage of imaginary beings and magic (the theological stage) through the ego-striving, rebellions, and idealisms of adolescence (the metaphysical stage) to the realism and knowledge-based action of maturity (the positive stage). The process was ruptural, with no linear emergence of scientificity out of animism and theism. The intermediate stage of metaphysics, necessary for transition, represented a contradictory amalgam. The path to positivization was also uneven, proceeding through the successive positivization of each of the fundamental sciences, beginning with the most general and abstract and ending with the science of society. This whole movement, in turn, was keyed to the wider development of society—which also passed through three stages—through the dual relation of knowledge to technique and production on the one side and on the other, via religion and the dominant philosophy, to the mechanisms for reproducing the social tie.

The general line of march was from a localized agrarian-based society, with warfare and military rule, to a more peaceful world of *grandes sociétés* engaged in ever more extensive and interlinked forms of production and trade. Between them came a long and conflictual transitional phase, whose European origins Comte placed in the twelfth century with the rise of towns, guild production, and scholastic rationalism. The crisis had come to

a head in 1789, but while the Crown and aristocracy had been overthrown, religio-intellectual warfare continued. The Revolution had swept away the rotting institutions of the old order without sustainably establishing a new one. For this it was necessary first to complete the mental revolution that the rise of the natural sciences with Francis Bacon, Galileo, René Descartes, and Isaac Newton had initiated. Positivism, as an overall philosophy, would in turn provide a synthesizing middle way between the warring ideological parties of republican progressivism (which did not understand the prerequisites for order in the new regime) and counterrevolutionary conservatism (which did not understand the impossibility of returning to the old one), the intractability of which destabilized the French polity and threatened to derail both order and progress. The price of failure, at the limit, was a descent into anarchy in which the very survival of society as *un être composé* was at stake.

The stabilization of the new industrial-positive order also required an institutional reorganization. Comte's program for this evolved, but its main features remained constant from his early writings onward. In keeping with the task specialization that characterized industrialism, there would be a strict division of labor, both within the spheres of production, administration, and knowledge and within society as a whole. In keeping with what he took to be a universal law of social statics—and against the radical egalitarianism of Jean-Jacques Rousseau and the Jacobins—there would also be hierarchical order, with technocratic elites disposing over the state, while proletarians and women (the loving sex), under the leadership of intellectuals (of a positive sort), ruled hearts and minds through education and moral suasion. Overall, this reproduced, in updated dress, a medieval dualism: temporal rule by the lords of production—industrialists, engineers, and bankers—spiritual rule by scientist-teachers, coordinated by cadres of positive philosophers. After Comte's religious turn, the latter morphed into a fully organized church, replete with a catechism, public and private rituals, and a calendar of remembrances culminating in a festival of the dead. Thomas Henry Huxley described the results as Catholicism without Christ, and certainly Comte's intent was to keep the integrative forms of Catholicism while replacing its scientifically outmoded contents with the demystified worship of the "true Great Being": society and Humanity.

Comte expounded his system, which became ever more elaborate, in voluminous writings, chief among which are the six-volume *Cours de philosophie positive* (1830–42) and the four-volume *Système de politique positive* (1852–54). The first of these was hailed by many contemporaries, including John Stuart Mill, as a major intellectual landmark. The *Politique positive*, however, which, among other things, aimed to be both a treatise on sociology and the founding of la *religion de l'Humanité* with Comte himself as its *Grand-prêtre*, divided his followers and earned much ridicule. It aimed to introduce into all aspects of Comte's system the dimension of sentiments-feelings and substituting a ternary schema for a binary one of theory and practice alone. In the same stroke, it also shifted from the creation of an objective synthesis (whose insufficiency it thus recognized) to a subjective one, issuing in a projected work designed to draw the reader—in the first instance trainee positivist priests—into a simultaneously mental and passional relation with the cosmology and social-altruistic perspective that underlay it. This shift would later be complemented by further synthesizing totalizations—of action, of morale—but Comte died before he was able to complete this work, leaving only the first of a finally projected four volume summary of the subjective synthesis and sketches for others.

Life and Works

Born two years before Napoleon Bonaparte's coup to a fervently Catholic and royalist petit-bourgeois family in Montpellier, Comte's life and work unfolded amid the turbulent aftermath of the French Revolution. It was a period marked by incessant struggles between republican and antirepublican forces, the latter ideologically led by an unreconstructed Catholic Church, which retained control of primary and much of secondary education until the post-Dreyfus reforms in the Third Republic. During his own lifetime, there were four further changes of regime, in 1814, 1830, 1848, and 1852, leading to two monarchies, a second republic, and a second Napoleonic empire.

Comte had quarrelsome relations with his family, and by the time he entered the elite École Polytechnique in 1814 to study for a career as a mining engineer, he had become a staunch republican. After the defeat of

Napoleon, he played a leading role in the student agitation that greeted the Bourbon restoration and Napoleon's brief return. A further protest against the exam system led to the closure of the École. When it reopened a year later, Comte refused to make a promise of good behavior as the price of readmission.

In 1816, after a term studying biology at Montpellier (France's oldest medical school), he returned to Paris, where he found part-time work as a mathematics tutor, read voraciously, and began to style himself Auguste. With a growing interest in political economy (particularly, the Scottish historical school), he was drawn to Henri de Saint-Simon and his circle and in 1819, became Saint-Simon's secretary. To the further consternation of his father, in 1825 he married Caroline Massin, a free-spirited woman of working-class origin who was rumored to supplement Comte's meager earnings through other liaisons.

Comte's relations with Saint-Simon were close. But what began as a mentorship and progressed to intellectual collaboration (including as editor of Saint-Simon's journal *l'Industrie*) ended in irreparable conflict with charges and countercharges of plagiarism. These came to a head in 1824 when Saint-Simon insisted on publishing in his own name an essay Comte claimed as his own. How to disentangle Saint-Simon's thought from Comte's has always been a vexed question. There is no doubt that they shared a diagnosis of the intense conflicts between progressives and reactionaries that dominated the post-Revolutionary scene and of what was wrong with both positions. They were also agreed on the need for a moral reform of emergent industrial society based, doctrinally, on a secular-scientific replacement for otherworldly religion. Overall, it would be fair to say that Saint-Simon, influenced by Bacon, Condorcet, Destutt de Tracy, and the Ideologues (with borrowings from Maistre and Bonald) pioneered the outlines of what became Comte's system, but it was Comte who turned it into a system. In doing so, moreover, he considerably modified its ingredients. Gone, with sociology and positive philosophy, was Saint-Simon's singular science of man. Gone too was the reductive unification of knowledge around some single natural law (gravity, thought Saint-Simon). The philanthropic love that was at the emotional center of both of their forms of religiosity was also more ascetic and hierarchical in Comte's "live

for the other” (*vivre pour l’autrui*) than in Saint-Simon’s “love one another as brothers”

Comte’s early writings in the 1820s already contained the main elements of his analysis of, and solution to, the social crisis. They also began to work out the elements of social physics and its place among the positive sciences. Noteworthy is an essay on François Brossais’s *De l’irritation*, which foreshadowed the uses Comte would later make of biology in developing a notion of equilibrium and a physiologically based theory of sentiments. Comte thought well enough of these essays that, two decades later, he appended all six, under the title *Opuscules fondamentales*, to the last volume of *Politique positive*.

In 1826, Comte began a course of lectures that eventually became the six volumes of *Cours de philosophie positive*. However, his writings and lectures were interrupted by a severe episode of mental illness. This illness led to his first being hospitalized and then being nursed back to health at home by the long-suffering Massin. He later recalled the experience as a regression to fetishism (the animistic first stage of theism) and then back again, through all the phases of mental development, to positivity as he regained mental balance. In addition to what may have been a bipolar condition, Comte suffered recurrent bouts of stomach pain.

The volume-by-volume publication of the *Cours* at first attracted little notice outside the coterie who had gathered round Comte’s lectures, but with the final volumes on sociology, he began to draw support from a few important backers including, in Paris, Émile Littré. It was certainly a tour de force, providing a theorized history of each of the fundamental sciences, the phenomenal levels of the natural order to which their object domains corresponded, the different methods proper to each, and the logic of their successive development toward positivity. The whole account culminated in the founding of sociology, which comprehended this movement and the logico-historical necessity for its completion.

Always in straitened circumstances, Comte found recurrent employment as an examiner in mathematics at the École Polytechnique. However, his increasingly acrimonious attempts to secure a professorial chair at that institution were unsuccessful. He finally burned his bridges with a scathing

personal attack on his envious persecutors. Whatever ambitions he may have harbored to make the École Polytechnique itself a radiating center of the new philosophy came to an end. Instead, he would form his own organization, the Positivist Society, which he launched in 1848.

The most important event, however, to affect the development of his project was his tragic love affair with Clotilde de Vaux. A young widow with a passion for literature, she insisted on celibacy. Theirs would be the shared love of two pure souls devoted to humanity. Comte and Massin had separated, in part because of his increasingly conservative, not to say medieval-chivalric, views on the role of women. Through his intense relation with Clotilde these views crystallized, but with the epiphany that if women were predisposed to rule hearts in parallel with men's rule over minds, and if the synthesis of thought and feeling was essential for overall social order, then women and feelings had a strategic role to play at every level of positivism's system and program.

When, after a rapid illness, Clotilde died of tuberculosis in 1846, Comte was paralyzed with grief. After days of seclusion and prayer he emerged with a feeling of religious conversion. Clotilde was to be memorialized as *ma sainte ange*, with intercessionary power. Their love incarnated the altruism that was at the summit of the sentiments, an altruism kept alive through his memorial devotions. Their relation became a paradigm for the more general dictum that "man is saved through woman." Comte himself, finding in all this a vital complement, at the level of feelings, to the intellectual basis positive philosophy had provided for a post-theistic morale, took on the role of religious leader and, in the *Système de politique positive* (1850–52), laid out the doctrine, rules, and ceremonials of his new religion.

The *Système* was a multileveled work. On its programmatic side, it presented itself as both a founding religious document and as the sociologically arrived-at ground plan for a fully positive polity (written, as if in the future, describing what its normal form would be). Besides providing a comprehensive blueprint of all facets of social life from the economic administrative and juridical to the familial, artistic, and religious, it emphasized the international dimension. At the apex of social

development humanity would assume the form of a federation of nation-states, spiritually unified in a syncretistic cult of the Great Being, Humanity.

At the same time, it was a treatise on sociology itself. As in the first system, sociology was divided into statics and dynamics. These, though, were much expanded, with sentiments systematically woven in. They were woven in, moreover, not just as elements of the knowledge object, but subjectively, so as to infuse with love for the social totality the ennobling story of humanity's emergence into the fullness of its potential. There was also much attention to the temporal side of *société*. For Comte, introducing a distinction subsequent sociology was to drop, social integration, even in industrial society, depended not only on ties among the living (*solidarité*), but also on ties between the present generation and those of the past and future (*continuité*). Correlatively, the Humanity worshipped in positive religion was a temporal as well as spatial totality. It included the dead and the not yet born, the stages of Humanity's becoming as well as its present members and forms of being. Given that the history of Humanity's emergence was mostly complete, this meant, too, that the greater part of it could only exist in memory. Hence, the great importance in positive religion of memorial sites and practices, with public veneration for Humanity's greatest benefactors, family-based cults for the worthy majority and—positivism's equivalent of damnation—oblivion for criminals and the antisocial. Overall, we may note, positive sociology in this subjective register functioned like a kind of theology. As with the Christian version, the object it aimed to understand was simultaneously an object of faith and worship. There was the difference, though, that Comte's god was a self-consciously human creation, not just in representation, but in its very being, through the work both of memory and morale-building required to sustain it.

Comte played a minor but active role in the tumultuous events of 1848 to 1851, which saw the overthrow of Louis Philippe, the declaration and collapse of the Second Republic, and the coming to power of Louis Napoleon and the Second Empire. To this latter, Comte gave qualified support, as a second best to what he had been calling for: a transitional revolutionary government along the (nondemocratic) lines of the post-Thermidor Convention. Meanwhile, he sought to build his church and in his

Appel aux conservateurs, to draw together a larger coalition of primarily conservative forces to press for the changes outlined in *Système de politique positive*. These efforts were not notably successful, although Comte did enter into a dialogue with Felicité Robert de Lamennais, a prominent Catholic theologian, and Catholics and Positivists joined forces to campaign against the removal of the Parisian cemetery to the outskirts of the city. As for the Positivist Society, by the time of Comte's death in 1857, the Paris headquarters was already hardening into a fissiparous sect. Nonetheless, branches were set up in England and in several countries of Latin America, where Comte's positivism proved to be a congenial counter-Catholic ideology for modernizing elites in post-Bolívarian regimes. To this day, the Brazilian flag carries the motto "Ordo e progresso." It is also a Brazilian positivist whose iconic mother-and-child portrait of Humanity cradling the future in her hands is still displayed at 12 Rue Monseigneur-le-Prince in Paris, where Comte's former house has been preserved as a museum and shrine.

Much of Comte's writing in the 1850s concerned the popularization of his church and philosophy. Besides the *Appel*, these writings included *L'Esprit de Positivism* and *Cathechisme positiviste*. His system, however, was not yet complete. The *Politique positive*, in its quasi-theological transfiguration of sociology, had initiated a wider resynthesis of knowledge. In its full form, the *synthèse subjective* was to consist of treatises on each of the fundamental sciences treated in the *Cours*, plus a seventh, *la morale*, which drew from biology and sociology to produce a crowning science of the soul. Of the latter, he left only a diagrammatic note. Astronomy, physics, and chemistry, he hoped, would be the work of others, and sociology, he considered to have been covered by the *Politique positive*. He did, however, complete volume one, *Logique positive, ou traité de philosophie mathématique*. An immense work, and his last, the *Logique* provided a ground plan for the whole subjective synthesis as well as an account of mathematics itself, conceived as a growing synthesis of sentiments and reason via the successive rise and eventual integration of number, algebra and geometry.

The preface also elaborated on a modification Comte had made to his religious symbolism. In its initial form, positive religion had centered on a singular cult of Humanity. In its modified form, there were three objects of

worship. To *l'Humanité* as *le Grand-Être* were added *la Terre*, as *le Grand-Fétiche* and *l'Espace*, as *le Grand Milieu*. This same trinity was built into the schema for the *synthèse subjective*. The work in its entirety was designed, among other things, to lead its readers successively through an appreciation for each of the transcending categories making up the revised positivist cult.

Through mathematics would be revealed the grandeur of space as the ground of the whole natural order, through the physical sciences the grandeur of our planet as the material ground of life, and through sociology and *la morale*, as the crown of the life sciences, the grandeur of the social being in which (in the Pauline phrase Comte liked to quote) “we move, breathe, and have our being.” In his insistence that space, earth, and humanity, with their trail of metaphoric associations, be venerated as if they were living spirits, while at the same time being consciously regarded as products of the imagination through which the axes of positivism’s worldview could be emotionally and cognitively fixed, Comte’s thinking takes a strange turn. In effect, positive religion now presents itself less as a demystified climax to monotheism than as a demystified form of *fétichisme*: a scientifically enlightened return, that is, to what, according to Comte and contemporary anthropology, had been humanity’s first form of religion.

Beyond even the *synthèse subjective*, Comte envisaged one further step to complete his system. After the syntheses of intellect and sentiments there would be a synthesis of action. The *système de l’industrie positive*, focused on work and production, would chart the growth of humanity’s *pouvoir modifactory*—that is humanity’s power to modify and perfect its own earthly milieu—a project that Comte saw culminating in such fantastic ventures as climate modification through altering the orbit of the earth and the elimination of sex from conception, linked to a cult of *la Vierge-Mère*.

Reception and Significance

While there has recently been some renewed attention to his thought, including Mary Pickering’s magisterial biography, Comte remains a rather neglected figure. Discredited for what Durkheim called “the absurdities into

which his system fell,” his influence has been disavowed even when, as with Durkheim himself, it has arguably been strong. Neither positivists nor sociologists have wanted to own him. Comte’s combination of technocratic with religious reform has repelled more than it has attracted. Karl Popper included Comte among the enemies of the open society. Herbert Marcuse linked him with the rise of the “totally administered society.” Meanwhile, grand systems building has fallen wholly out of favor, as too have grand narratives of progress.

Nonetheless, Comte’s writings, especially before the mid 1840s, left a significant imprint, and Comtean influences can be detected in many of the major currents of modern thought. In addition to positivism’s attraction for modernizing autocratic regimes in the New World at the end of the nineteenth century, these range from Baron Pierre de Coubertin’s project of the modern Olympics as a humanist festival, to Karl Marx and Friedrich Engels’s scientific socialism, to Friedrich Nietzsche’s meditations on the death of god, nihilism, and the ending of metaphysics. In France, while Comte’s system, and systematizing, was abandoned, his impact on social theory was formative. Durkheimian sociology, with its linkage to *solidarisme* and civil religion, can be seen as a liberal-Kantian correction. Historical epistemology, through Gaston Bachelard, Georges Canguilhem, and Michel Foucault, also owes a debt to Comte, as does a continuing interest in social ontology and its dismantling. Louis Althusser, whose structuralist revision of Marxism owed much to Comte’s *philosophie positive*, described Comte as the only mind worthy of interest in nineteenth century French philosophy. Whether Comte will ever be read again in the light of present history is debatable, but in the context of renewed conflicts about religion, secularism, and science, Comtean themes may regain some currency.

Condorcet

A mathematician and economist brought up in the school of Francois-Marie Arouet Voltaire and Jean le Rond d'Alembert and a philosopher committed to the French Revolution, Marie-Jean-Antoine-Nicolas de Caritat, Marquis de Condorcet (1743–94) is among the most important intellectual figures of the period linking the Enlightenment and the French Revolution. His philosophical work re-elaborates the materialistic and antimetaphysical ideas of the eighteenth-century *Philosophie*, establishing them as the basis for a renewal of moral and political sciences aimed at founding the rights of man on the sensitive and rational nature of human beings while at the same time expanding the scope of the mathematical sciences and the calculation of probability in collective deliberations. In terms of a progressive conception of history that is finally formulated in *Esquisse d'un tableau historique des progrès de l'esprit humain* (1794), his political thought during the period of the Revolution gives full form to a modern idea of the Republic, whose significant elements are (1) the rights of man interpreted in the wake of John Locke as the purpose of the political contract, (2) a representative democracy including an extensive participation of citizens, and (3) a theory of the constitution that identifies in the rights of the individual a legal limit unfringeable by sovereign power. His political rationalism, open to radical democratic reform, is unanimously interpreted by revolutionary historiography as a prescient criticism of political Jacobinism—the championing of universal principles and of a centralized republic—which was destined to succumb to the revolutionary conflict and

which anticipated elements of twentieth-century democratic constitutionalism.

His political thought during the 1770s and 1780s was directly influenced by the leading figures in French and significantly, in American culture. After studying mathematics, which gained him the appointment as Secretary of the Académie des Sciences in 1776, he became a supporter of the reform projects promoted by Anne-Robert-Jacques Turgot toward the end of the 1770s. Until the fall of the *Ancien Régime*, he championed a reform of the French monarchy from the top and a legislative rationalization that included the abolition of privileges, religious tolerance, free trade promoted by the Physiocrats, and at a political level, gradual introduction of forms of representation that sought to express the voice of the nation. In the decade prior to the Revolution, he was in close contact with such fathers of the American Revolution as Thomas Jefferson and Thomas Paine. He urged the abolition of slavery through the *Société des Amis Noirs* and in Paris, along with Jacques-Pierre Brissot, he was an influential voice in that pro-American movement that regarded the constitutional experiences across the Atlantic and a republic of free and equal citizens as the ideal to be followed.

The events of 1789 and the start of the French Revolution saw a radicalization of his political philosophy. Elected to the Legislative Assembly in 1791, of which he became president, and once again to the Convention in 1792, he developed a political and constitutional theory that expressed the liberal language of liberty and the democratic language of equality. In the representational institutions, along with the rights of man and the extension of democracy, he now promoted the right to *secours publiques*: a de facto equality aimed at eliminating the causes of man's dependence on man without harming individual personal and economic liberties. From 1790, he was an open supporter of universal male suffrage, and his long campaign for political rights for women makes him and his wife Sophie de Grouchy forerunners in the emancipation of women; he drafted and presented to the Assembly (April 20–21, 1792) the *Projet d'Instruction publique*, which laid the foundation for the secularization of schools; he also prepared social security measures (the *caisses d'accumulation*) to protect unfortunate citizens from poverty and destitution.

The first Project for the Republican Constitution of revolutionary France, known as the Girondin Constitution, presented by him to the Convention on February 15 to 16, 1793, is largely his work and the most important product of his political ideals. This constitutional project, which interpreted democracy in radical form and strongly procedural manner, was supported by the Girondists but immediately became caught up in the political struggle that led to the Montagnards gaining control of the Convention and from there, to the Terror. The political conflict eventually also brought down the philosopher himself. He was convicted of treason by the Revolutionary Tribunal in October 1793. Forced to flee, he went into hiding, where he wrote his philosophical testament, *Esquisse d'un tableau historique des progrès de l'esprit humain* (1794), a full expression of the eighteenth-century theories of progress before his arrest and death in uncertain circumstances in a revolutionary prison.

Conservatism

Conservatism is a group of political and social ideologies that promote traditional social and political institutions, gradualism in political action, and opposition to radical political and social movements.

As an identifiable international intellectual and political movement, conservatism originated in opposition to the French Revolution and was heavily influenced in its early years by Edmund Burke's essay *Reflections on the Revolution in France*, first published in 1790 (1987). After the revolution, conservatism spread throughout much of Western Europe and was influential in the ideologies of leading diplomats and intellectuals of the nineteenth century, including Klemens von Metternich, Joseph de Maistre, and Juan Donoso Cortés.

During the eighteenth and nineteenth centuries, conservatism was characterized by a preference for political rule by the established elites and aristocrats and opposed to rule by the middle classes or working classes. By the twentieth century, conservatism began to lose its particular attachment to the established aristocracy, but continued to promote rule by natural, untitled elites. In all historical periods, philosophical conservatives have expressed opposition to mass-democracy movements, fearing that democracy leads to dictatorship.

The specific policies and political programs favored by conservatives have varied significantly among differing societies and have changed over time,

depending on the nature of traditional institutions in each society. The traditional status of capitalism or monarchy or Catholicism, for example, greatly influences the nature of the society that the conservative seeks to preserve.

Today, conservatism is associated with numerous center-right and right-wing political parties throughout Europe and in Anglophone countries including the United States, Canada, and Australia. The degree to which ideological conservatism influences the political programs of such parties is a matter of dispute, however, as modern political parties and movements associated with conservatism often embrace ideological components in conflict with traditional conservatism, such as liberal economics and mass democracy.

Reaction Against Revolutions in Europe

The French Revolution and the subsequent destruction of church and royal power in France, followed by the Reign of Terror, were a source of widespread dismay among aristocrats and elites in both Europe and the United States. Even before the Terror, Burke responded to the early stages of the Revolution with his *Reflections on the Revolution in France*, which condemned the Revolution on the grounds that it uprooted most traditional French institutions and was based on excessively theoretical assertions. Burke had earlier supported the American Revolution on the grounds that the Americans were seeking to preserve traditional rights and an established way of life against interference from the British Crown. In Burke's view, the French Revolution, unlike the moderate American Revolution, was radical and rootless.

The de-Christianization of France during the revolution, coupled with the destruction of the established aristocratic ruling class, alarmed other intellectuals among the aristocracy throughout Europe in the following decades.

Maistre, an aristocrat of Piedmont-Sardinia, called for the restoration of the Bourbon monarchy following the war and embodied the conservative creed of throne and altar that Maistre considered essential to maintaining a just

and lasting society. Unlike Burke, who promoted individual liberties and decentralization of political power coupled with religious freedom, Maistre was dogmatic in his support of monarchy and traditional religious institutions, going so far as to declare that citizens must respect and even love a despotic ruler. According to Maistre (“Les Soirees de Saint Petersbourg,” quoted in Viereck 2006, 132), when faced with a severe and suspicious prince,

there is no better course than resignation and respect, I would even say love, for since we start with the supposition that the master exists and that we must serve him absolutely, is it not better to serve him, whatever his nature, with love than without it?

Later European theorists, such as Juan Donoso Cortés, who supported constitutional monarchy against the liberals and socialists of Spain, were influenced by Maistre either directly or indirectly.

Klemens von Metternich, who in later decades would, perhaps unfairly, become a symbol of right-wing reaction for the European left during the nineteenth century, in fact rejected the more authoritarian and reactionary strains of conservatism found among the disciples of Maistre and embraced a doctrine of stability through peace and economic progress and a less authoritarian version of the throne and altar doctrine. Metternich, who referred to himself as a conservative socialist, urged the formation of a limited parliamentary system in Austria and recommended increases in local self-government, provided that such reforms did not lead to revolutionary changes.

The liberal and socialist revolutions of the mid-nineteenth century continued to spur conservatives toward political action and philosophical argumentation against the perceived excesses of democracy, capitalism, and revolutionary movements that were spreading across Europe.

The Syllabus of Errors, a papal document published by Pope Pius IX in 1864, represented a significant international victory for the hard-line conservatism of Maistre and Cortés and to a lesser extent the less

authoritarian conservatism of the Metternich school. The document condemned liberalism, socialism, communism, and some forms of rationalism and denied that “the Roman Pontiff can, and ought to, reconcile himself, and come to terms with progress, liberalism and modern civilization.”

Continental strains of conservatism, most typified by the works of Maistre, Cortés, Metternich, and Friedrich von Gentz, were significant in European political development, but in the centuries since the French Revolution, Burke’s brand of compromising, nonideological conservatism has proven to be the most influential and widespread form of conservatism. This significance is especially true in the English-speaking world.

Chief characteristics of conservatism that were general across most schools of conservatism prior to World War II include opposition to mass democracy, support for religious institutions, a preference for rule by aristocrats or a natural elite, and an aversion to theories of government not based on established experience.

Conservatism continued to be an influential ideology among the established elites in Europe through the twentieth century. The Congress of Vienna (1814–15), chaired by Metternich himself, was followed by nearly a century without any large-scale wars in Europe, which contributed to the stability of the conservative regimes then in place and enabled them to withstand the many liberal and socialist revolutions of the mid-nineteenth century. The success of secular democratic and socialist regimes following the end of World War I brought an end to conservative dominance in Europe.

Prudential Versus Ideological Conservatism

Conservatism can be either prudential or ideological in nature, and the two types are not mutually exclusive. Prudential conservatism assumes that institutions that are traditional are valuable in themselves and worthy of preservation. Institutions that have stood the test of time signal to conservatives that they perform an important function in the society in which they exist. The nature of these institutions can vary significantly

from society to society, and an institution that is traditional in one society, such as Parliament in the United Kingdom, may not be traditional in another society, such as in Austria. Thus, what is conservative in one society may not be conservative in another. The value of an institution is assessed by empirical observation and experience rather than through theoretical constructs. According to George E. Yoo (2007, 110), prudential conservatives also seek to avoid destroying valuable institutions through excessive change:

The presumption behind the arguments of the prudential conservative is that the social equilibrium is delicately balanced. Social institutions are inherently unstable and easily destroyed when tampered with. Prudential conservatism thus does not necessarily appeal to any socially ideal patterns of society.

Prudential conservatives historically expressed a distrust of rationalist and theoretical arguments that might lead to a devaluation of longstanding and useful institutions in society. Burke, for example, was preeminent among the prudential conservatives and was known for his insistence that no “rational man ever did govern himself by abstractions and universals.”

Ideological conservatism, on the other hand, relies at least partially on rationalist argumentation to determine the value of various institutions in society. Unlike prudential conservatives, ideological conservatives often conclude that there are in fact theoretically ideal patterns of society and that specific natural laws may exist that are applicable to all societies regardless of historical experience. Maistre, for example, employed rationalist and theoretical arguments to defend the French monarchy and the Catholic Church as indispensable in French society. Indeed, Maistre concluded that monarchy is a divinely sanctioned absolute and a superior form of government in virtually all situations. Similarly, the American John C. Calhoun regarded his views on the dangers of majority rule as applicable universally, although he wrote for a specifically American audience.

Most conservatives employ elements of both prudential and ideological conservatism, although few conservatives engage in theoretical system

building to the same extent as liberals and socialists. The degree to which one is an ideological or prudential conservative nevertheless generally falls on a spectrum between Burke on the prudential end and Maistre on the ideological end.

Nationalism and Internationalism

The degree to which nationalism has been associated with conservatism has varied from time to time and from place to place. Initially, conservatism, closely associated with Christianity in most cases, was emphatically internationalist given the nature of Christianity, especially Catholicism.

Burke endorsed mild nationalism as one value among many in his writings but denied that love of country should eclipse other values. Metternich, as an agent of Austria, a society of mixed ethnicities and religions, was naturally internationalist in his thinking, as was evident in his contributions at the Congress of Vienna. Maistre, as a Catholic monarchist, endorsed international Catholic institutions as essential to the maintenance of a just society. Aristocratic cosmopolitanism was a central component of the thinking of numerous conservatives following the French Revolution.

In what Peter Viereck calls the great reversal in conservative thought, however, conservative theorists moved from internationalist to nationalist as the nineteenth century progressed with the preponderance of conservative thought moving toward nationalist theories after 1870 in Europe. Originally associated with the middle classes and with groups radically opposed to international states such as Austria, nationalism was later invoked by liberals and socialists in diverse circumstances to bolster support for a variety of mass movements.

Conservatives initially rejected these nationalist movements, but by the second half of the nineteenth century, nationalism was employed by conservative statesmen such as Otto von Bismarck as a means of maintaining the status quo for the princes of Prussia and neighboring states, while the vehement philosophical nationalism of Maurice Barrès in France asserted the existence of a collective national soul that he claimed disallowed conservative support for individualism and internationalism.

By the twentieth century, the nationalism supported by Bismarck and Barrès was used by fascists in efforts to denounce democracy and to support racist assumptions of national superiority. Conservatism fundamentally differs from fascism, however, in that conservatism opposes mass movements and radicalism. Swiss conservative Jakob Burckhardt, for example, predicted that the antiaristocratic mass movements of the late nineteenth century would lead to terrifying militaristic authoritarianism and notably, German Catholic aristocrats such as Bishop Clemens von Galen and Claus von Stauffenberg were central figures within the few resistance movements sustained during Nazi rule in Germany.

Although the excesses of the fascist regimes of the 1940s discredited the untrammelled nationalism of earlier years, conservative political parties internationally have tended to associate themselves with nationalism since 1945. The conservative movement in the United States, for example, has traditionally supported nationalist programs such as anti-immigration measures and an aggressive foreign policy.

In Europe, the Conservative Party of the United Kingdom is associated with Euro-skepticism, although the Party is divided on the issue.

Nationalist parties in Europe such as the National Front in France and the Party for Freedom in The Netherlands tend to oppose further integration into the European Union on nationalist grounds while supporting immigration restrictions and efforts to reinforce national identity.

Relationship With Liberalism and Capitalism

Although numerous center-right and conservative political parties are associated with support for capitalism in the twenty-first century, conservatives were generally opposed to capitalism and to the philosophy of laissez-faire associated with liberalism during the nineteenth century. An American example is the antebellum proslavery aristocrat George Fitzhugh, a Virginian who compared Southern legal slavery favorably with the asserted horrors of Northern industrial capitalism.

Historian Ralph Raico has noted that classical liberalism was closely associated with the middle classes of the nineteenth century, which were in turn associated with laissez-faire and industrialization. Conservatives in Europe opposed the middle classes as the forces of liberalism and revolution. British conservative Samuel Taylor Coleridge was adamant in his opposition to the middle-class capitalists represented most completely by the Manchester Liberals of the mid-nineteenth century. In response to the Reform Act of 1832, which allowed the middle classes to vote in Parliamentary elections, Coleridge ("Table Talk," quoted in Viereck 2006, 127) declared,

You have disfranchised the gentry, and the real patriotism of the nation, you have agitated and exasperated the mob, and thrown the balance of political power into the hands of that class which, in all countries and in all ages, has been, is now, and ever will be, the least patriotic and least conservative of any.

Conservatives accused middle-class capitalists of valuing economic profit above all else and therefore of degenerating into materialism. Maistre specifically condemned economists, by which he meant liberal economists, and Metternich singled out the middle classes as being most susceptible to faulty theories of government. Bismarck opposed what he called the Manchester money-bags for their insistence on free trade.

Contrary to Coleridge's doctrinaire opposition to capitalists, however, many conservatives by the twentieth century accepted capitalism and the middle classes as acceptable players within public affairs.

Since World War II, in Europe and throughout the Anglosphere, capitalism and the middle classes have been closely associated with conservatism, with numerous center-right political parties espousing economic liberalism alongside traditionally conservative elements such as support for Christian religious institutions. The United States, lacking an indigenous aristocracy, has historically produced few conservative theorists opposed to the middle classes and capitalism.

In typical Burkean fashion, conservatism, which once regarded industrialization and middle-class political power as revolutionary innovations, eventually adopted these elements as traditional once they had become firmly established in society and thus no longer revolutionary by the early twentieth century.

The conservative embrace of capitalism illustrates Burkean conservatism's willingness to adopt institutions and ideologies once considered anathema. This openness to aspects of liberalism has not led to reciprocation from all liberals. Laissez-faire liberal Friedrich von Hayek, in his essay "Why I Am Not a Conservative," accuses conservatives of simply reacting to other ideologies and consequently embracing components of liberalism and socialism for want of any positive ideological program.

Conservatism in the United States

Whether or not conservatism has a tradition native to the United States is a matter of dispute. Because the United States lacks any influential ideologies supportive of titled aristocracy or monarchy and possesses ruling classes that are historically bourgeois and capitalist in nature, many observers of American politics, such as Louis Hartz, have concluded that American ideological traditions are predominantly liberal. The ideology that is known as conservatism in America is therefore a variety of liberalism.

American conservative Russell Kirk, on the other hand, maintains that John Adams and the Federalists of eighteenth-century America were conservatives for a variety of reasons. Specifically, they were suspicious of democracy, and they sought only to preserve English political rights that had been established following the English Civil War.

The American Revolution, according to Kirk and Viereck, was conservative and waged to preserve an existing way of life rather than to assert new political rights. Laissez-faire liberal Murray Rothbard disputes this interpretation, however, and asserts that the war itself, the removal of the loyalists after the war, and the subsequent land reforms were all revolutionary in nature.

Later Southern theorists such as George Fitzhugh and Calhoun, who defended a southern landed aristocracy as an essential component of American civilization, appear to be more easily and properly identified as conservatives.

The political movement known as the conservative movement in the United States is largely rooted in nineteenth-century liberalism although elements of traditional conservatism are found within the movement, especially in the thought of Kirk and the traditional conservatives.

The pre–World War II conservative movement, however, originated in opposition to the social democracy of the Franklin D. Roosevelt administration during the Great Depression and was characterized by laissez-faire and what is now called libertarianism, more than with what was then known in the United States as conservatism. The word *conservative* had been used by left-wing critics of the libertarian opposition groups to characterize them as reactionary and antiliberal.

Only in the 1950s did some of these same opposition groups affirmatively adopt the term conservative—to the objection of libertarians. Writing in 1961, Ronald Hamowy denied a connection between American laissez-faire ideologies and conservatism. According to Hamowy and other libertarians of the time, the new European-style conservatism supported by Kirk and other traditionalists was

the conservatism not of the heroic band of libertarians who founded the anti–New Deal Right, but the traditional conservatism that has always been the enemy of true liberalism, the conservatism of Pharonic Egypt, of Medieval Europe, of Metternich and the Tsar, of James II, and the Inquisition; and Louis XVI, of the rack, the thumbscrew, the whip, and the firing squad. (Critchlow and MacLean 2009, 67)

In spite of these objections, the conservative movement in the United States has been closely associated with laissez-faire ideology since the 1950s. Combining elements of anticommunism, nationalism, laissez-faire, and

social traditionalism, the conservative movement in the United States has long been influential within the center-right Republican Party in the United States.

Conservatism Outside the West

Conservatism as an ideology is indigenous to Europe and the West. Numerous aspects of conservatism, such as an adherence to traditional morality and a respect for established hierarchical political institutions, bear similarities to numerous political movements outside the West, although in many cases the similarities are coincidental.

Many societies, movements, and parties in the Muslim world, for example, are labeled conservative, although this is not due to any preferred connection to European institutions such as the Catholic Church. Indeed, any institution in the Muslim world that would endorse the views of theorists such as Maistre would be considered countercultural and radical. Similarly, Singapore has long been labeled conservative for its moral traditionalism and resulting social policy, including censorship of sexually unorthodox (by Singaporean standards) publications and broadcasts.

While numerous Western conservatives have integrated elements of liberalism into their ideological framework, non-Western societies, historically lacking a liberal laissez-faire tradition, are less likely than Westerners to view liberalism as potentially conservative or as part of local social and political traditions in more recent decades.

Nevertheless, nonideological prudential conservatism as a style of politics is often used outside the West by some movements and parties as a means of promoting political and social stability along with traditional morality. In many cases, however, this style of politics is more heavily influenced by local philosophical traditions such as Confucianism.

Contemporary Conservatism

Numerous center-right and right-wing parties in recent decades are built upon coalitions of nationalists, advocates of liberal economics, and advocates for traditional morality. Such parties, which include the Conservative Parties in the United Kingdom and Canada, the Republican Party in the United States, and the Liberal Party of Australia, are also often notable by their use of prudential conservatism as a style of politics.

Many observers regard the 1980s as the high point of conservative politics in the West since World War II because of the Conservative Party's electoral victory in the United Kingdom under Margaret Thatcher in 1979 and the election of Ronald Reagan in the United States in 1980. As with many conservative political movements of the late twentieth century, the Reagan and Thatcher programs were marked by a mixture of economic liberalism, nationalism, anticommunism, and social traditionalism.

The wide-ranging privatization efforts under Thatcher owe more to liberal laissez-faire ideology than to British conservatism, prompting some observers of Thatcher to label her as radical rather than as conservative. Reagan's professed economic liberalism also runs counter to the conservative label, but with both Thatcher and Reagan, their pro-Western, anticommunism, nationalism, and associations with traditional morality mark their tenures as conservative.

Today, in spite of the views held by most nineteenth-century conservative theorists, conservatism is far more closely associated in the political realm with right-wing populist parties than with Burkean conservatism or aristocratic opposition to mass democracy.

In Europe, the Danish People's Party, the Party for Freedom in The Netherlands, and the National Front in France are often regarded as both conservative and populist. These right-wing parties tend to oppose immigration, to support traditional morality, and in some cases, to explicitly support church-state alliances, as with the Danish People's Party's support for the Church of Denmark. The hard-line nationalism of many modern right-wing groups and their appeals for mass democratic support, however, separate many right-wing parties of recent decades from historical conservatism and even from contemporary adherents of Burkean-style conservatism.

Widely known theorists and politicians that can be considered historically orthodox in their conservatism have been rare in recent decades, although two Austrian aristocrats bear mentioning. In both cases, liberalism's strong influence on traditional European conservatism is evident.

The Austrian-born nobleman Erik von Kuehnelt-Leddihn described himself as a conservative arch-liberal and opposed to democratization, mass movements, fascism, and totalitarianism. Kuehnelt-Leddihn is notable for asserting in a variety of scholarly works that had the conservative regimes of Europe survived World War I, Europe would have avoided the totalitarianism of the 1930s and 1940s. At the same time, he accepted numerous tenets of liberalism, including natural rights and the benefits of laissez-faire, and was a columnist for publications of the American conservative movement.

Similarly, Otto von Habsburg, at one time the heir to the throne of Austria, was a conservative, a close associate of laissez-faire liberal economist Mises and a member of the liberal Mont Pelerin Society. An internationalist conservative, opponent of Nazism, and early advocate of European integration, Habsburg was a member of the European Parliament during the 1980s and 1990s, an opponent of communism, and a supporter of what he viewed as traditional European civilization.

Constant, Benjamin

Benjamin-Henri Constant de Rebecque (1767–1830) was the son of Louis-Arnold-Juste de Constant de Rebecque, from a Swiss Protestant aristocratic family, officer in the Dutch service, and of Henriette-Pauline de Chandieu-Villars. His mother died a couple of weeks after giving birth to him, so Benjamin was initially cared for by female relatives and his father's housekeeper (and later wife) before embarking on a number of educational experiences abroad, which took him to Bavaria, Edinburgh, and Paris.

He returned to Switzerland in 1786, and shortly after he met the novelist Isabelle de Charrière, a Dutch aristocrat twenty-seven years his senior. By the standards of his life up to then, it turned out to be one of his most steady friendships, and also helped his career considerably. In 1788, he became chamberlain at the court of the duke of Brunswick, where he remained until he had to leave in 1794, following one of the many scandals (and duels) that attended his eventful life. Meanwhile, in 1789, Constant had married Wilhelmine von Cramm. The marriage turned out a disastrous failure, and an acrimoniously fought divorce ensued eventually in 1795.

His employment at Brunswick meant that Constant spent the most tumultuous years of the French Revolution in a rather parochial north-German court. Shortly after his return to Switzerland, in 1794, Constant met the most famous of his many mistresses, Anne Louise Germaine de Staël (Mme de Staël), daughter of the Swiss banker and former minister of *ancien-régime* France, Jacques Necker, and wife of the Swedish

ambassador to Paris. Constant followed Mme de Staël to Paris in May 1795 where he became a French citizen and embarked on an eventful political career. After the coup of 18 Brumaire that brought Napoleon Bonaparte to power, Constant, helped by Abbé Emmanuel Joseph Sieyès, was elected to the Tribune, from which he was expelled in 1802 for consistently resisting Napoleon's wishes. He spent the next twelve years (until the defeat of Napoleon in 1814) in exile, much of it traveling with Mme de Staël. His relationship with her deteriorated steadily during these years, especially following his secret marriage to Charlotte von Hardenberg in 1808. During this period, Constant produced some of his best-known works, including his psychological, partly autobiographical novel, *Adolphe* (written in 1806, but published in 1816).

Once the Bourbons were restored to the French throne, Constant returned to Paris and resumed his journalistic activities. Then he fell hopelessly in love with Juliette Récamier. When Napoleon escaped from Elba in 1814, it was possibly in order to be near Mme Récamier in Paris that Constant accepted his old scourge's request to serve him during the Hundred Days. Constant was the main architect of the *Acte additionnel* to the constitution of the empire during the *Cent-jours*.

After a few months spent in London following the final fall of Napoleon, Constant returned to France to become, during his last years (1817–30), a major figure in the liberal opposition to the restored Bourbons, fighting passionately for freedom of the press, separation of powers, ministerial accountability, and a representative parliamentary regime. He was elected a representative in 1819 and again in 1824, 1827, and 1830. Following the July Revolution of 1830, he was reelected to Parliament and made president of the Council of State. He died in Paris on December 8 of that year.

Among his political works a particular place is held by *De l'esprit de conquête et de l'ururpation dans leurs rapports avec la civilisation européenne*, directed against Napoleon. Written hastily after the debacle of the emperor's Russian campaign, in November to December 1813, *The Spirit of Conquest and Usurpation* was published in Hanover in January 1814. Constant developed there one of the ideas he is most famous for: that war, slavery, and military conquest belonged to an earlier phase of social

development and that in modern, commercial societies, it was *le doux commerce*, peace, and individual liberty that corresponded to the spirit of the times. This idea meant that the whole experience of France under Napoleon and his conquests was a perniciously anachronistic enterprise and doomed to failure.

The other major (and related) idea Constant is celebrated for is his famous formulation of the distinction between the liberty of the ancients and the liberty of the moderns. The best-known version is the 1819 lecture *De la liberté des anciens comparée à celle des modernes*, where Constant explained that the attempts of French revolutionaries and especially the Jacobins in the late eighteenth century to impose a regime of virtue, patriotism, and civic participation was hopelessly anachronistic, trying to revive a political model that corresponded to the social state of ancient Greek and Roman republics. Modern, advanced commercial economies imposed insuperable constraints to such a revival. But at the same time, Constant insisted on the importance of an irreducible modicum of political participation among the citizens of modern political communities, if these communities were not to fall prey to the twin dangers of excessive individualism and the despotism of Napoleon-like usurpers. Those (such as Isaiah Berlin) who paid more attention to the first part of Constant's message have read him as an ideal-typical advocate of what Berlin has called negative liberty. However, his emphasis on the need for civic vigilance and participation makes his message much more complex than a simple advocacy of negative liberty. Constant also had for decades a strong interest in the study of religions and the religious experience, which resulted in his five-volume study *De la religion* (1824–31).

Constitutionalism

The principle of constitutionalism is an application of the principle of the rule of law to the highest organs of government. The rule of law requires that all members of society—officials and citizens alike—be governed by law so that no one may exert arbitrary power over the lives, liberty, or property of others. A society's constitution consists of laws and customary norms that establish and empower the highest organs of government, legislative, executive, and judicial. The principle of constitutionalism requires that the constitution also effectively regulate and control governmental powers to minimize the possibility of their exerting arbitrary power over citizens.

Kenneth Culp Davis (in *Discretionary Justice*, 1969) famously distinguished between three methods of controlling discretionary power: confining, structuring, and checking. *Confining* power means keeping it within defined boundaries, *structuring* it means regulating the methods or procedures by which it may be exercised, and *checking* it means ensuring that it can be reviewed by some external person or agency. A constitution can use all three methods to control the exercise of governmental powers, and each can contribute to the rule of law.

Legal and Political Constitutionalism

A distinction is often drawn between legal and political constitutionalism. Legal constitutionalism involves imposing legal limits on governmental powers, often expressed as individual rights, and charging the judiciary with enforcing them. In Davis's terminology, it relies on legally confining powers and judicially checking them. Political constitutionalism uses political mechanisms to control government: on structuring political decision making through bicameralism, the separation of powers, and federalism; on enabling the political branches of government to check and balance one another; and on requiring the accountability of the executive branch to the legislature and ultimately, to the electorate. So political constitutionalism relies mainly on politically structuring the exercise of power and accountability.

Written and Unwritten Constitutions

Most written constitutions, following the American model, embody both legal and political constitutionalism. Even if they lack a Bill of Rights that restricts legislative power, they usually entrust the judiciary with the enforcement of provisions establishing structures such as the separation of powers and federalism. But legal constitutionalism has been a much less prominent feature of the British constitution compared with more modern ones. In Britain, even the executive branch was subject to comparatively weak judicial control until the late twentieth century, and the legislature is still not subject to constitutional limits that the judiciary can enforce. The doctrine that Parliament has legally unlimited or sovereign legislative power still rests at the foundation of the British constitution. It follows that there is no aspect of that constitution that Parliament cannot change, except perhaps that it cannot restrict its own sovereign power.

A constitution can be written or unwritten, although very few examples of the latter kind still exist (they include Britain, New Zealand, and Israel). Unwritten constitutions may consist of customary laws; nonlegal norms that are generally regarded as obligatory, called constitutional conventions in Britain; rules or principles of common law; and ordinary statute law—in each case, insofar as they deal with the composition, powers, and procedures of the highest organs of government. It is more difficult for unwritten constitutions to bind government organs effectively. Customary

norms are often vague and imprecise, statute and common law can readily be altered by ordinary legislation, and effective means for enforcement are frequently elusive. Before the late eighteenth century, moral and customary norms were widely thought to limit the powers of monarchs, but they were vague and contestable, and the only means of enforcement was armed rebellion. In Britain, the powers of the monarch were eventually brought under the control of the common law and of Parliament, but only after a civil war, followed soon after by a revolution.

The founders of the United States of America invented the idea that legal limits to government could be set out in a written constitution that was difficult to amend and was enforced by an independent judiciary. They hoped that these features would mitigate, if not solve, the problems of vagueness, excessive alterability, and unenforceability. But the problem of vagueness, or at least generality, cannot be eliminated because many of the moral principles that should limit government are inherently abstract and imprecise and cannot be reduced to clear and specific rules. For example, this generality characterizes the most famous guarantees of rights in the U.S. Constitution. Its founders expected that the meaning of these principles would be gradually clarified through political debate and decision making as well as judicial interpretation. The extent to which this clarification has occurred is debatable. As for alterability, it is very difficult to strike an optimal balance. Article V of the U.S. Constitution is not alone in mandating an amendment procedure that makes it quite difficult to adjust the constitution to technological and social developments, or to changes in community values. It is widely assumed that, consequently, necessary change has had to be achieved through irresistible political movements, such as President Franklin D. Roosevelt's New Deal, and by means of creative judicial interpretations.

American, British, and Hybrid Models

The American founders did not rely mainly on the judiciary for the enforcement of their new Constitution, partly because they regarded the judiciary as the least powerful organ of government. Also, such reliance would have left unsolved the problem of how the powers of the judiciary itself would be effectively controlled. Instead, the founders relied on each

branch of government helping to check and balance the others. Although they adopted a system of separation of powers by their vesting legislative, executive, and judicial powers in different organs, the separation was not absolute: each organ was empowered to interfere to some extent with the activities of the others. For example, the president was given power to veto legislation passed by Congress and to nominate federal judges, the Senate was given power to veto the appointment of federal judges and cabinet members, Congress was given power to impeach the President and federal judges, and so on. Above all, the founders relied on the power of the sovereign people to hold their elected representatives to account, either through the ballot box or in the last resort, by invoking the ancient remedy of armed rebellion, as reflected in the revolutionary logic of the Declaration of Independence and in the inclusion of the right to bear arms in the Second Amendment of the Bill of Rights.

Throughout the world today, the British model of political constitutionalism—and more generally, the idea of legislative sovereignty or supremacy—is on the wane. The American model of constitutionalism has been adopted in most countries that have achieved independence since World War II. This model comprises a written constitution, claiming to express the will of the people, which provides for:

- Democratic elections for a bicameral legislature and (when the executive is separated from the legislature) for the head of the executive government.

- Overlapping powers that enable the various organs of government to check and balance one another.

- Guarantees of individual rights.

- An independent judiciary with (a) authority to enforce constitutional requirements, including guarantees of individual rights; and (b) exclusive authority to conclusively settle legal disputes in general.

- A requirement that the constitution can be changed, if at all, only by some special, democratic procedure that requires a broader consensus and more careful deliberation than the procedure for ordinary legislation.

These abstractly defined elements are capable of being implemented in many different ways. This fact is most obviously true of the first element: democratic elections for the legislature and the head of the executive government. For example, presidential systems are very different from parliamentary ones. Methods of checking and balancing the exercise of powers also vary greatly, and it is difficult to strike an ideal balance between disabling government from acting impulsively and oppressively and enabling it to act efficiently and when necessary, decisively. Some critics regard the American system as a recipe for policy gridlock.

Judicial independence meets with almost universal approval. It is important that legal disputes be decided by judges whose independence from political and other extraneous influences is beyond question. But it is extraordinarily difficult to formulate a workable definition of legal disputes for this purpose. In many jurisdictions, certain kinds of controversial legal questions are decided by administrative tribunals, and there may be good reasons (concerning expertise, expense, and expedition) for not referring them to courts and even for restricting judicial review of tribunal decisions. Again, various kinds of independence can be conferred on courts. At a minimum, the executive government should not be able to dismiss judges at will or penalize them by reducing their salaries, except as part of a general, nondiscriminatory reduction in public service remuneration in the interests of austerity. But should they be appointed for life or only for fixed terms? Should the executive branch be able to reward them through reappointment or promotions from lower to higher courts? Should it be able to confer nonjudicial functions on them, either in their capacity as individuals or in their official capacity as judges? Should their salaries be set by an independent tribunal? Should they be appointed only by or with the consent of such a tribunal (or perhaps existing judges)? With respect to many of these questions, it may be better to leave protection of judicial independence to political prudence and custom rather than to attempt to impose rigid legal rules.

Special democratic procedures for altering constitutions can also vary enormously, including referenda, supermajorities in the legislature, special constitutional conventions, and in federal systems, the assent of some fixed proportion of state or provincial governments, legislatures, conventions, or

electorates. Whether particularly important constitutional provisions should be permanently entrenched and unamendable (as they are in Germany and India) is a debatable question. The choice of an amending procedure obviously depends on the individual circumstances of the country concerned.

The judicial enforcement of human rights can be implemented in a variety of ways. Should only first generation or negative rights—as opposed to socioeconomic rights—be protected? Should they be protected by only a special constitutional court; through abstract, pre-enactment review of legislation; or by ordinary courts whenever issues of rights are raised in everyday litigation between parties? Should legislatures have the authority to preempt or override judicial invalidation, as in Canada? Should judicial enforcement be confined to creative statutory interpretation and declarations of incompatibility, as in Britain today?

The judicial enforcement of constitutional rights remains more controversial than the other elements of the now popular American model. A small number of political and constitutional theorists continue to resist the rights revolution that has been sweeping the globe by denying that positive rights are necessarily desirable. These contrarians concede that in some countries, they might be highly desirable or even essential for the preservation of democracy, the rule of law, or human rights, but they deny this assertion as a universal truth. Much depends on culture, social structure, and political organization. In some countries, a history of rampant corruption, populism, authoritarianism, or bitter religious, ethnic, or class conflicts may make political constitutionalism ineffectual, and judicially enforceable constitutional rights desirable. But for well-established liberal democracies, the contrarians continue to advocate political rather than legal constitutionalism on the grounds that it better respects the democratic ideal of government elected to represent the opinions and interests of ordinary people. According to this ideal, ordinary people have a right to participate on equal terms in the political decision making that affects their lives and should be presumed to possess the intelligence, knowledge, and virtue needed to do so. When the requirements of justice and human rights are the subject of reasonable disagreement, the opinion of a majority of the people or those elected to represent them, rather than of a majority of some

unelected elite such as a tiny number of judges, should prevail. On this view, the price that must be paid for giving judges power to correct the occasional clear injustice is that they must also be given power to overrule the democratic process in the much greater number of cases in which there is reasonable disagreement and healthy debate. They see this power as too high a price to pay.

Proponents of constitutionally entrenched rights warn that even democratically elected legislatures have violated the rights of individuals or minority groups, either because they have failed to properly represent majority opinion or because that opinion was swayed by ignorance, passion, or prejudice. The contrarians do not naively overlook this danger. But they trust that, in appropriate political, social, and cultural conditions, clear injustices will be relatively rare and that in most cases, whether or not the law violates someone's rights will be open to reasonable disagreement. They also trust that the dialogue and compromise that characterize democratic deliberation will, over time, foster mutual respect and tolerance among contending political and social groups. If there are deficiencies in the representative and deliberative processes of a democratic system, they advocate improving those processes to promote better representation and more careful, well-informed, and dispassionate reasoning, rather than rushing to adopt judicially enforceable rights.

Rather than having to choose between the American model of judicial supremacy in protecting rights and the older British model of parliamentary sovereignty, new hybrid models in the British Commonwealth now arguably combine the best features of both. In Canada, New Zealand, and Britain, much greater responsibility for protecting rights has been given to judges, while preserving the legislature's authority to have the last word. Canada's famous "notwithstanding" clause (s.33 of its Charter of Rights) enables legislatures to override most of the rights protected by the Charter. This feature gives poor expression to an intention to enable legislatures to override not the rights themselves, but judicial interpretations of rights that the legislature regards as erroneous. In New Zealand and Britain, judges may interpret legislation creatively to make it consistent with protected rights, but they may not invalidate it: if a rights-consistent interpretation is impossible, they may only issue a declaration that the legislation is

incompatible with specified rights. Parliaments are then legally free to choose whether or not to amend the legislation, either to override the interpretation given to it by the judges or to remedy the declared incompatibility. It is often argued that this compromise model improves the quality of interinstitutional exchange and dialogue about the protection of rights without subordinating the considered judgment of the legislature to that of the judges.

These hybrid models are experiments that may or may not work. It has been suggested that in practice, they are likely to collapse into something like the American model of judicial supremacy. But even if this concern is valid, continued experimentation with different constitutional models is desirable. Premature convergence on a single model of constitutionalism might be dangerously complacent, refusing to concede the possibility that better methods of balancing the relevant competing values can be found. Indeed, it may be desirable that some liberal democracies persist with their commitment to legislative supremacy, based on the old democratic ideal. It might turn out that they are able to protect human rights as well as those that have embraced the American model or one of the new hybrid ones without having to compromise a more vibrant democracy.

As nation-states increasingly cede political power to transnational and international organizations, such as the European Union and the World Trade Organization, constitutionalism faces the new and difficult challenge of designing mechanisms to effectively confine, structure, and check their power. It may be that traditional mechanisms designed for states will not suffice and that new paradigms are needed.

Contract Theory

Contract theory

Contract Theory

Contract theory explains or justifies social or political authorities, political obligations, or various moral norms by conceiving them as the product of some sort of an agreement. Social and political theorists use the notion of a contract to understand who is bound, to what they are bound, and why they are bound. Historical and contemporary debates in contract theory consider whether being the product of an agreement is an adequate account of the scope of authority or moral obligation. Though few if any contract theorists appeal to an actual historical agreement, either tacit or hypothetical contracts play key roles in many accounts of authority, obligation, or justice.

Socrates

Plato (c. 427–347 BCE) illustrates a notable early use of contract theory in his dialogue in the *Crito*. Plato's narrative shows Socrates's friend Criton coming to Socrates's (c. 469–399 BCE) prison cell on the eve of his execution. To many contemporary readers, an Athenian jury had unjustly sentenced Socrates to death on trumped-up charges of impiety and corrupting the young. Criton attempted to persuade and help Socrates to escape, but Socrates refused. Socrates argued that he had accepted numerous benefits of Athenian society and remained a resident of the city when he had the chance to leave, so he had in effect agreed to do as the state asked—even if it meant accepting a death sentence he found

questionable. To accept Criton's offer to bribe the jailer, thus breaking the law requiring the guilty to accept their legally authorized punishment, would have, according to Socrates, served to undermine the entire system of Athenian law.

However, as a semifictionalized character in Plato's *Republic*, Socrates rejects the contract theory of Glaucon, another character, who argues that justice is whatever people decide to define it as contractually. Here, as a mouthpiece for Plato, Socrates appears to reject his own contract argument in the *Crito*, eventually arguing for an absolute conception of justice as each person doing what he or she is best at in the serving the community. Most scholars explain this apparent contradiction as simply reflecting Plato's own versus Socrates's thinking about justice and the social contract.

Thomas Hobbes

Socrates's appeal to tacit agreement illustrates how citizens might be bound to act in ways they disapprove of. In *Leviathan* ([1651] 1968), Thomas Hobbes (1588–1679) took the appeal to agreement even further as the basis for his quasi-moral notions of natural law. Absent any stable social or political power, Hobbes claims human beings are in a “state of nature” that he described as a “state of war.” In life, there is “solitary, poor, nasty, brutish, and short” (Hobbes [1651] 1968, 186). Persons would do well to find some conventional substitute for the right reason that nature fails to provide and thus leaves the natural laws of good behavior silent in the state of nature. Hobbes argued that individuals must agree to give up their rights of private judgment and freedom of action to a sovereign power whose will shall be the basis of justice and, ideally, the enforcement of such natural laws as seeking peace and honoring one's agreements. This collective act is a form of contract since agents agree with one another to accept a common sovereign power, or when threatened after the contract is adopted, they agree directly with the sovereign power itself.

Hobbes used contract theory to show that agreeing to an absolute sovereign is the only solution to prepolitical violence. He also used the contract to create the basis of moral norms, which can be summarized as a prudential version of the golden rule of doing unto others as one would have them do

unto oneself. This approach makes Hobbes not only a political-contract theorist, but in a limited sense, a moral-contract theorist as well. The limit to Hobbesian morality derives from its purely calculating quality of reciprocal—as opposed to pure—altruism, a concept more fully developed by modern evolutionary psychology and cultural anthropology.

A virtually unique limitation of the absolutism of the Hobbesian contract is the right of individuals to resist any act of the sovereign that threatens their lives. Because self-preservation is what motivated free individuals to contract away their freedoms to a dauntingly powerful sovereign, they cannot, according to Hobbes, be supposed ever to have surrendered their natural right of self-defense. Hence, scholars have noted, despite the appearance of a social contract, the citizens in effect remain in a state of nature vis-à-vis their sovereign.

Hobbes's political theory is liberal since he traces political authority and obligation to the free consent of all subjects. Indeed, Hobbes treated agreement as the basis for all authority. This position is part of his argument against the view that some persons by nature are entitled to rule over others. Hobbes maintained that any obligation must be traced to the consent of those bound.

An unusual and extreme implication of Hobbes's consensual contract comes in his account of parents' authority over children. On his view, the dominion a mother enjoys over her child rests on what a child would and must agree to. Of course, children do not and cannot actually consent in the normal sense of the term. Rather, Hobbes makes this argument to dramatize the consensual basis of all dominion. Like the adult citizen, the child consents to being ruled in the expectation of receiving protection and nurture from the authorities.

John Locke

John Locke (1632–1704) used the logic of contract to justify a far more limited government than the Hobbesian *Leviathan*. Locke's social-contract theory, as expounded in his *Second Treatise of Government* ([1679] 1960), creates a political vision from moral norms that pre-exist civil society. On

Locke's view, the state of nature is not necessarily a state of war. Some peace under the laws of nature is possible without government. But the natural condition does have its inconveniences, such as biased and unfair enforcement of the laws of nature. Locke thus argued that people agree to set up a government whose power depends on the ongoing consent of the governed. The people may rescind the power to rule if the state abuses it. Locke thereby justified a limited right of revolution that helped inspire the American War of Independence.

Locke rooted political power in the consent of the governed, so he needed to explain in what sense subjects have consented to their government, given that plainly many have never actually done so. On his view, continued residence in a state's territory amounts to implied consent to the state's rule. David Hume (1711–76) later worried that such implied consent cannot bind individuals if the costs of dissent are excessive. Hume also argued more generally against implied-consent accounts of political authority and obligation. He noted that we often think authority binds persons even if they cannot be understood to have consented to political dominion, and indeed, that we rarely even think of our obligations in terms of consent. John Simmons (b. 1950) similarly argues that implied consent is an inadequate foundation for the political authority we commonly attribute to modern states.

Because the protection of property—including life, liberty, and estate—was the main purpose of Locke's contract, citizens' use of money played a key role in justifying the proprietarian social and political contracts he advocated. By using the national currency, Locke argued, citizens tacitly agreed to the economic inequalities of a class society.

Jean-Jacques Rousseau

Jean-Jacques Rousseau (1712–78) believed that neither Hobbes nor Locke fully considered the distorting effects of civilization on human development, corruptions featured in Rousseau's *Discourse on the Arts and Sciences* (1750) and *Discourse on the Origins of Inequality* (1754). Rousseau argued that civilization is responsible for all pernicious inequalities among us, especially in wealth and power. In the *Social*

Contract ([1762] 1987) Rousseau argued that to secure freedom, human beings must create a social contract that would become the basis of a general will, conceived as the true common good that we would all voluntarily will if we clearly understood our own interests. This general will stipulates that a just society must elevate freedom, equality, and community above wealth, status, and power as the true social good. Enlightened citizens freely seek the general will and in so doing, realize their true freedom by identifying with public good. Because political representation corrupts the general will, the small community envisioned by Rousseau would be a direct democracy of all the people making their own laws. Like Locke, Rousseau argues that if government becomes oppressive, revolution is justified. He is regarded as a philosophical father of the French Revolution of 1789.

Immanuel Kant

Hobbes had held that the state was a convention based on the mutually self-interested agreement of individuals motivated to minimize conflict and achieve security. Immanuel Kant (1724–1804), however, believed that the state could not rest on people's incidental inclinations. A justified state is based on the principles of freedom, equality, and independence. Its acts constitute legitimate rule insofar as they are expressions of a public law. All citizens must be understood to agree on the public will that affirms public law, and this agreement is the original contract by which individuals establish a lawful commonwealth. But on Kant's view, this original contract is not an actual agreement; it is an idea of reason by which to understand the limits of and justification for state authority.

Kant is a political-contract theorist. He maintained that legislators must fashion laws so that they could theoretically have been the product of the united will of all citizens. A law is then unjust, on Kant's view, if it would be impossible for all people to agree to it. As does Rousseau, Kant makes clear, however, that laws can be just even if people such as they happen to be would not in fact agree to them. The purpose of law is not to secure people's happiness; it is to make possible what Kant calls a "state of right" ([1793] 1983, 78). Kant's account left little if any room for a justified right of revolution. An appeal to the original contract shows that citizens must

have given up their rights of private judgment; otherwise, the commonwealth would be in vain and it would be impossible to establish right.

John Rawls

Through the nineteenth century, contract theory appeared in some social and political theories, but it was not a prominent part of leading discussions. In the mid- to late twentieth century, however, John Rawls (1921–2002) refocused theoretical discussions. Rawls is widely credited with reinvigorating both political philosophy in general and contract theory in particular.

In Rawls's 1971 work *A Theory of Justice*, justice emerges from a social contract among persons in a fair bargaining situation he calls the original position. Such persons are behind a veil of ignorance where they know nothing about any actual distinguishing features of themselves such as race, class, sex, or religion. They are denied such knowledge because they recognize that such features are morally irrelevant and ought not to affect the choice of principles of justice. Rawls held that persons are disposed to cooperate with one another, but that they want to realize their goods—whatever those might be. Such persons then unanimously agree upon two principles of justice to govern the basic structure of society. First, all persons are equally entitled to maximal basic liberties consistent with a similar extent of liberties for others. Second, upon securing fair equality of opportunity, we can justify inequalities in social and economic positions only if these work to everyone's advantage, but especially the advantage of the least well-off.

Denied knowledge of one's particular position in society, Rawls argues, persons would agree only to principles that would work to the advantage of a generic person and would therefore agree to fair principles that will promote the advantage of all. In particular, individuals bargaining fairly would adopt a maximin strategy that would maximize the position of the worst-off since after all, behind the veil of ignorance, they do not know whether they will be among the least well-off.

In *Political Liberalism* (1993), Rawls shifted from a substantive contract of justice as fairness to a procedural approach that recognized the unrealistic nature of his earlier vision: “The fact of a plurality of reasonable but incompatible comprehensive doctrines—the fact of reasonable pluralism—shows that as used in *Theory*, the ideas of a well-ordered society of ‘justice as fairness’ is unrealistic” (xvii). Rawls argues that the principles of justice can be partially realized as the product of an overlapping consensus among reasonable persons with differing conceptions of the good. Rawls later (2001) applies the logic of contract to determine how various decent peoples might agree to a framework for international law.

David Gauthier

The contract theories of Rousseau, Kant, and Rawls all idealize the agreeing parties or the conditions of agreement. Their theories do not take persons as they are, nor do they look at actual agreement to understand political legitimacy or moral justification. Instead, their theories treat the agreeing parties as idealized versions of actual persons, either by discounting or redirecting motives to realize private good (as in Rousseau and Rawls) or by considering what persons are committed to insofar as they are free, equal, and independent citizens (as in Kant). In Rawlsian theory, for instance, the conditions of agreement are constrained by independent moral notions of fairness. By contrast, contract theories in the Hobbesian tradition do not apply independent moral notions to the agreement. Instead, moral norms arise from the agreement.

Working in the Hobbesian tradition, David Gauthier (b. 1932) offers a moral-contract theory in which we imagine what sorts of norms actual rational persons would agree to as the basis of mutually acceptable constraints on their conduct. Gauthier is particularly concerned to understand how moral norms would secure not merely our agreement, but our compliance. Gauthier thus conceives contract theory as offering a response to the moral skeptic who asks, “Why be moral?”

Gauthier’s answer involves appealing to contract theory and a theory of rationality. First, consider that there are certain benefits uniquely possible via peaceful cooperation. Each person wants to realize these benefits, and

she or he wants as much of these benefits for her- or himself as possible. But she or he also knows that all other agents have similar preferences. So while any person might prefer that everyone else agree to sacrifice her or his respective interests on her or his behalf, she or he knows such asymmetrical norms will secure neither universal agreement nor compliance. Instead, each agent offers concessions that depart from this ideal (for her or him) in order to get everyone's agreement to the norms necessary for realizing the benefits of cooperation. Gauthier calls this bargaining solution the "minimax relative concession." Each agent considers how much to concede in light of similar concessions by others. Agents would then agree only to norms that minimize the most they would be asked to give up compared to others.

Gauthier's second response to the challenge "why be moral?" is a new account of practical rationality. Gauthier argues that agents have a reason to comply with moral norms, even when at some given moment it may appear best to renege on their agreements. This honoring of norms occurs because agents best secure the benefits of cooperation by constraining their pursuit of available benefits. Agents will agree to constrain their behavior only with others who agree to do the same and who are actually disposed to constrain themselves when opportunities to do otherwise arise.

Similar to Rawls's theory, Gauthier's contract theory sees parties to the agreement as wanting to realize the benefits of cooperation. Unlike Rawls, however, Gauthier considers moral norms as emerging from—but not preceding and shaping—an agreement. Also unlike the ignorant contractors of Rawls, the parties to the agreement Gauthier describes are fully aware of their holdings, endowments, and relative positions.

Challenges to Contemporary Contract Theory

Recent critics offer several important challenges to any contract theory. First, something other than agreement may justify either our moral or our political obligations, including natural rights, natural law, and compassion for others. Second, some critics argue that hypothetical agreements are not agreements at all, begging the question of what kinds of agreements actual people would in fact be willing to make. Third, the assumption of

knowledgeable, rational, and able contractors leaves out children, the disabled, nonhuman animals, and members of future generations, who arguably deserve just treatment even if they cannot contract. Finally, some argue that contract theory would become more persuasive if it systematically incorporated mechanisms by which the specific terms of a social contract, or political constitution, could be changed to reflect new conditions, new thinking, and changed values of a people.

Cosmopolitanism

Cosmopolitanism

194

195

Cosmopolitanism

Cosmopolitanism is a diffuse philosophical tradition that, at its core, emphasizes belonging not in the polis, but in the single community of humanity, the cosmos. The Stoics were the first school of thought to develop the term *cosmopolites*—citizens of the world—in the third century BCE. However, it was not until the late eighteenth century that cosmopolitanism was revived as a term, and the first modern debate on the topic emerged. To this debate the work of Immanuel Kant was key. Seeking to sketch the conditions of a post-Hobbesian international order, wherein peace would prevail among the peoples and states of the sovereign state system, Kant developed and defended the idea of a cosmopolitan social contract. A cosmopolitan social contract, grounded in acts of human will, promises laws that not only restrain the exercise of sovereign power and thus limit the possibility of war, but also respect the rights of individuals as citizens of the world. Kant's emphasis on the relationship between law and morality—the moral community of all rational beings as both the subject and object of pacifying international laws—has exerted a strong influence on all variations of cosmopolitan thought prevalent today.

More specifically, contemporary cosmopolitan thinking, influenced by the work of Kant, can be tentatively divided into three broad categories: moral (exemplified in the work of Onora O'Neil), legal (Jürgen Habermas), and political (David Held). Although these categories are by no means a strict division—cosmopolitan arguments often identified with one or another category often cut across them—it is nonetheless important to retain this

distinction. It enables us to discern differences and similarities among otherwise diffuse strands of thinking. In particular, for moral cosmopolitans who follow Kant's insights into the universal capacity of all rational beings to experience a moral sense, the world community at the center of all cosmopolitan thinking crystallizes into a universal duty to respect and promote basic human rights and justice worldwide. Citizenship of the cosmos, then, rests on the cultivation and enforcement of moral norms and relationships according to moral cosmopolitans.

By contrast, for legal cosmopolitans, it is institutionalization and a cosmopolitan legal framework that create and consolidate the world human community. For instance, a leading proponent of legal cosmopolitanism, Habermas (2006), argues in his book *The Divided West* that the world community will be unified and pacified through the juridification of the international system. By thus reworking the constitutional aspect of Kantian cosmopolitanism, Habermas puts forward the idea of a global domestic politics—that is, a politics conducted under the framework of cosmopolitan law, implemented by global institutions (such as the United Nations), and legitimated from within national public spheres. Yet a question arises at this point. If international politics and its juridification constitute the main focus of the writings of legal cosmopolitans, then how do their arguments differ from those thinkers identified as political cosmopolitans? Legal cosmopolitans emphasize the role that international law and institutions play in the consolidation of a human political community, but they do not explicitly speak about democracy. The focus on democracy is precisely what distinguishes political from legal cosmopolitans. Political cosmopolitans such as David Held envision the democratization of the world community through the promotion of processes of participation at different levels and settings—from the local and state levels to the regional and global levels. By thus participating in decision taking about issues that transgress territorial borders, individuals exercise and give meaning to their rights as cosmopolitan citizens.

The themes of deterritorialization and juridification, along with the prioritization of common humanity, with its rights and duties, constitute a common thread among the strands of contemporary cosmopolitan thinking. This commonality is no mere coincidence. The end of the Cold War in 1989

and the apparent victory of liberal democracy (as claimed by Francis Fukuyama in *The End of History and the Last Man*, 1992) gave renewed impetus to cosmopolitan arguments and largely framed the concerns figuring at the center of the three strands of contemporary cosmopolitanism. Yet criticisms remained, ranging from the unrealistic prospects for the consolidation of a world community in the absence of world government, to the homogenizing and antipluralistic implications of privileging common humanity over cultural difference. These criticisms have cast doubts on the feasibility as well as the desirability of cosmopolitan visions. Such doubts intensified after the events of September 11, 2001, and it remains to be seen how and when cosmopolitan thinking will experience its next big revival.

Critical Theory

Critical Theory

Critical theory is a term first used by the philosopher, sociologist, and social psychologist Max Horkheimer in an essay published in 1937 titled “Traditional and Critical Theory” to describe the various interdisciplinary approaches that emanated from within the Marxist tradition and were developed within the Frankfurt school to critique society. However, critical theory covers a host of thinkers that adopted different ways to understand the social world, so there is no overall agreed unity on what constitutes the term. The most notable of these theorists, along with Horkheimer, are the philosopher, sociologist, and musicologist Theodor Adorno and the philosopher Herbert Marcuse, constituting the first phase of development up to the 1970s, and in the second phase, the philosopher and sociologist Jürgen Habermas, the dominant figure, along with the recent contributions of the philosopher and social theorist Axel Honneth.

Despite such differences, there are certain themes that thinkers within a critical theory approach share and utilize to inform their own approaches, albeit again in different ways, to expose the repressive nature of existing society, in particular capitalism and fascism. The main thinkers they relate back to are the philosophers Immanuel Kant and Georg Wilhelm Friedrich Hegel, the social and economic theorist Karl Marx, and the founder of psychoanalysis, Sigmund Freud. The key concepts developed from these thinkers include alienation, reification, reason, and aesthetics.

Alienation and Reification

The critique of society offered by critical theory was substantially dependent on the core concepts of alienation and reification, both developed by Marx. The pivotal event in the development of the alienation thesis came with the publication of Marcuse's essay "Foundations of Historical Materialism" in 1932. This was the first attempt to critically assess the young Marx's unpublished manuscripts on alienation, and applying this theory to contemporary society became a recurring theme within the critical theory tradition. Alienation was seen as being rooted in the productive relations that people enter into in the commodified world of capitalism that denied our common humanity. Marcuse's intervention was crucial because he argued that Marx's early writings were not an aberration that were later discarded, but the foundation of his humanism that was encapsulated in the way people try to realize their essence. Marcuse was to extend and deepen the alienation thesis in his subsequent writings as he attempted to grapple with the effect that rising living standards were having on people's ability to adopt a critical stance toward the capitalist system, resulting in his aptly titled *One-Dimensional Man* (1964). Another important development in the way critical theory used the notion of alienation was in the work of Adorno and most notably, his aphoristic masterpiece *Minima Moralia* (1951). Subtitled *Reflections from Damaged Life*, the work reflected the concern with alienated individuals not simply in relation to production, but in all aspects of their existence.

For Marx, reification was the way in which relations between people are transformed into relations between things. The term was first utilized by the Hungarian Marxist philosopher and literary critic György Lukács in his 1923 (1971) book *History and Class Consciousness*, to reflect the pervasive way in which relations between people are transformed into relations between things throughout the whole of society. Critical theorists adopted reification for their own purposes to emphasize the pervasive nature of capitalist instrumentality, as the following discussions will show.

Reason

In one sense, reason, however differently understood, can be seen as the leading concern in critical theory. In his 1937 essay, Horkheimer attacked the way reason was used instrumentally, and this theme was developed further in his collaboration with Adorno in their celebrated work *Dialectic of Enlightenment* ([1944] 1972). They argued that the Enlightenment had rightly emphasized the importance of reason against myths, superstition, and prejudice and so offered the possibility for the liberation of humankind. However, they also observed that reason's role in the development of civilization led to forms of domination involving labor, nature, science, and technology. On the one hand, instrumental reason spawned the culture industry of capitalism, whereby advertising cajoles and entices consumers to buy products they do not need. On the other hand, instrumental reason also contributed to the development of fascism, including its most barbaric form, Nazism. This historical approach to understanding reason with the interweaving of theory and practice exposed an administered world in which all relationships were commodified and reified people were treated as simple cogs in an oppressive machine, while being complicit in their own oppression.

Such an understanding of the world eventually found its most potent expression some years later in Marcuse's aforementioned *One-Dimensional Man*, which exposed how the post-World War II boom, resulting in an advanced technological society, had integrated workers into the capitalist system and nullified their opposition to it through relative affluence and the ability to buy an endless procession of consumer goods. Reason had therefore succumbed to a repressive world of technological rationality in which critical thinking was seriously undermined and affluent alienation predominated.

Adorno took this critical approach to the use of reason even further in his pathbreaking work *Negative Dialectics* ([1966] 1973), in which he further developed the critique of reason from his earlier work with Horkheimer. To combat the co-optation of reason, Adorno posited negative dialectics as a way to subject any critique to its own critique. For Adorno, negative dialectics was an ongoing process of reflexive questioning that can never come to rest. It posits nonidentity thinking against identity thinking. Identity thinking attempts to subsume particular objects under general

concepts, whereas nonidentity thinking exposes disparities and fluidities in the critical thinking process that can produce authentic change. Adorno therefore preferred to use the term *constellation* to conceptualize moments of disparity and contradiction. Adorno's negative dialectics calls into question the so-called progress of reason in formulations such as "no universal history leads from savagery to humanitarianism, but there is one leading from the slingshot to the megaton bomb." In contrast, Habermas, while also being aware of the instrumental nature of reason produced by capitalism, gave a far more positive account of the role of reason in terms of the ability of humans to act rationally and autonomously, particularly in his *Knowledge and Human Interests* ([1968] 1971). In his most influential work, *The Theory of Communicative Action* (1984), Habermas attempts to show how language and reasoning are crucial for human interaction and can serve as the basis for understanding and critiquing a host of political and ethical issues.

Psychoanalysis

Another important development in critical theory was the attempt to integrate the psychoanalytical theories of Freud with Marxist ideas to analyze the relation between the individual and society. Although this fusion originally initiated with Horkheimer, it was developed more extensively from the 1930s, first in the early writings of the psychoanalyst and social psychologist Erich Fromm and subsequently in the work of Marcuse, resulting in his main contribution in this area, *Eros and Civilization* ([1955] 1966), followed by Habermas, particularly in his *Knowledge and Human Interests* (1968). Although Fromm was hostile toward using the term critical theory, his insights in this area did inspire the other theorists, especially Marcuse, to rethink the relationship between Freud and Marx. Fromm began by adopting Freud's insights to argue that childhood experience had a crucial impact on how people develop as individuals. Fromm argued, following Freud, that sexual and survival instincts are at the basis of this development and are pivotal in understanding the human psyche. In addition, he endorsed Freud's view that people had to be comprehended not only individually, but also socially. However, Fromm contended that Freud did not give a convincing account of this social aspect of the individual. He maintained that it was only with

Marx and his emphasis on how individuals are embedded in social structures that a more sophisticated theory of human development could arise. Fromm then began to distance himself from Freud's theories and eventually, in 1938, rejected his theory of instincts, much to the dismay of Horkheimer, Adorno, and Marcuse. Against Fromm, Marcuse reaffirmed the importance of Freud's theory of the instincts by showing how the performance principle, capitalism's version of Freud's reality principle, serves to repress our basic drives instead of giving them fuller and freer expression. Marcuse sees this liberation and fulfillment of human essence occurring through the life-affirming quality of Eros against the death instinct, or *Thanatos*.

Habermas turns away from this psychoanalytic strain in the development of critical theory by featuring the problem of distorted communication in his own theory of communicative action through language. Habermas rejected Freud's theories as an unnecessary hindrance in this communicative process because of their focus on human frailty rather than on the conditions that can be created for human communication. By swapping Freud's psychoanalytic approach for the progressively developmental cognitive psychologies of Jean Piaget and Lawrence Kohlberg, Habermas completed the divorce between critical theory and psychoanalysis in the 1970s.

Aesthetics

Adorno brought critical theory to bear on aesthetics in his essay "Commitment" (1962) and with his posthumously published *Aesthetic Theory* ([1970] 1997). For Adorno, committed art exposes the false and fetishistic character of supposedly apolitical artworks that serve to titillate and thereby distract us from the clash of real interests in society. By becoming independent of market forces, such revelatory artworks attack the status quo. In *Aesthetic Theory*, Adorno enquires into the truth content and exceptional status of authentic, autonomous art, validating the fragmented style of the modernist art of composers such as Arnold Schoenberg, painters such as Paul Klee and Pablo Picasso, and writers such as Samuel Beckett, Franz Kafka, and Marcel Proust. For Adorno, such modernist art attempts to break through the reification and instrumentalism of capitalist society and in so doing, offers a deeply critical perspective on reality that reveals

possible moments of redemption. An appropriate pessimism makes people question the possibility of complete spiritual fulfillment through art, but authentic art can offer us the hope of partial fulfillment—reflecting its utopian quality. Indeed, for Adorno, redemption lies not in politics or in some social movement, but in art, a controversial stance that took critical theory away from practical revolts against the system. Marcuse's *The Aesthetic Dimension* (1977) pursued this line of argument, but with a broader perception of art that extended the possibility of its emancipatory power.

Critical Theory's Relevance Today

In all its forms, critical theory seeks to expose the bankruptcy of ideologies that serve to justify an oppressive status quo. Its reflexive nature, constantly probing and questioning even its own principles, is a testament both to its enduring analytical powers of social critique. It thus remains a viable research program to expose and undermine the reification and alienation still present throughout the world. Beyond Habermas's emphasis on discursive ethics, a new turn has also been offered in the work of Axel Honneth, in works such as *The Struggle for Recognition* (1992) and *Disrespect* (2000). Honneth is concerned with reaffirming and developing further the normative foundations of critical theory by focusing on how people strive for social recognition but experience disrespect due to the practices and institutions of society. By contrast, authentic recognition lies at the heart of a critique of contemporary society and can overcome those tendencies that would seek to nullify it.

Critical theory continues to stand as a powerful framework within which to critique the reifying and alienating tendencies of the societies of today.

Croce, Benedetto

Benedetto Croce was born in a family of wealthy landowners, February 25, 1866, in Pescasseroli, Abruzzo, but the family was from Naples, and this is where Croce lived the length of his long life, which ended in 1952. Croce lost both parents and a sister in the earthquake of Casamicciola in July 1883. Only another brother survived, Alfonso, who became the administrator of the family estate.

Croce and his brother were raised in Rome by an uncle, Silvio Spaventa, whose brother was Bertrando Spaventa, the major representative of the political right. After studying law for a while, Croce preferred to spend his time in libraries and listening to Antonio Labriola, whom he had met in the Spaventa household, and his lectures on Marxism. Disenchanted with university life and not attracted by the political life of the capital or interested in a career as diplomat as Spaventa would have liked, he returned to Naples in 1886. In the early years, he devoted himself to the study of the history and traditions of Naples and wrote works of some importance such as the edition in 1891 of Giambattista Basile, *Lo Cunto de li Cunti* (The Tale of Fairy Tales); *I teatri di Napoli* (The Theatres of Naples), and others on the history of Naples and the Spanish presence in the city during the Renaissance. For Croce, however, this period was not memorable; he called his work mere erudition and of little importance.

Croce dispensed first with the Marxist ideas that had occupied him during his stay in Rome and in his encounter with Antonio Labriola. The subject

occupied him from 1895 to 1900 and resulted in the publication of *Materialismo storico ed economia Marxista* (Historical Materialism and the Economics of Karl Marx 1900) in which he dismisses Marxism as just another approach to history. Although he believed Marx to be a better reader of Georg Wilhelm Friedrich Hegel than most Hegelians, he rejects his claim that theory can generate political action. Marx's socioeconomic theories reveal, rather, their dependency on a precise universe of values that are not scientifically verifiable.

Aesthetic (1902), Logic (1908)

Croce's lifelong meditation on history begins with the essay of 1893, "History Reduced Under the General Concept of Art." The essay consolidates his early erudite work of things Neapolitan but formalizes it by placing history with art and away from science because history "reproduces the particular in its concreteness" and narrates facts while science "looks for the general and works through concepts." The turning point, however, is the *Estetica* (Aesthetic) of 1902 (1990) in which Croce defines the essence of the aesthetic as symbol and identical to language, stated in the title of the work, *Aesthetics as the Science of Expression and of the Linguistic in General*. The task of the philosopher, then, is to differentiate the aesthetic from the pseudoaesthetic, the symbol from allegory. The separation has implications for history since one of the major complications that result is the correct differentiation of art from what is not art and therefore, art from history. It is only with the *Logic* of 1908 that Croce solves the problem by moving the concept of history from under the general category of art to philosophy by identifying history and philosophy: "I am claiming that history is philosophy, in fact, that history and philosophy are the same thing."

History

Croce defines his newly developed concept of history concurrently with his definition of poetry. In *La poesia* (Poetry), which can be considered his last major treatise on aesthetics, Croce attempts to separate the aesthetic from the pseudoaesthetic by relocating the latter under the category of literature.

A similar distinction is at work in the three major works he devotes to history: *Teoria e Storia dell Storiografia* (Theory and History of Historiography 1917), considered the fourth part of his philosophy of spirit (with *Aesthetics*, *Logic*, and *The Philosophy of the Practical*); *La Storia Come Pensiero e Come Azione* (History as thought and action) (1938); and the *Character of Modern Philosophy* (1941). In these works, the identity of history and philosophy is defined as absolute historicism and becomes the historical ideal that Croce upheld and opposed to fascism in the name of liberty.

Darwinism and Social Darwinism

Social Darwinism can be defined as the application of Charles Darwin's theory of biological evolution through natural selection to human psychology, behavior, culture, and history. It is controversial, with scholars disputing its precise meaning, its connection with Darwin's own ideas, and its role and significance in social and political thought. Moreover, Darwinism has been modified during the twentieth century due to advances in biology and related sciences, and these modifications have influenced Social Darwinism. It is, therefore, important to understand Darwinism as it was initially formulated in Darwin's *On the Origin of Species by Means of Natural Selection* in 1859 (1963) and the different ways it was interpreted by social theorists and ideologues until the end of World War II. Modern Social Darwinism likewise needs to be located within the context of twentieth-century developments in Darwinian evolutionary theory.

Evolution Through Natural Selection

Darwin's theory consists of a series of interlinked propositions. First, organisms inherit characteristics from their parents, but exhibit small inheritable differences. Second, organisms reproduce at a rate greater than can be sustained by existing resources. Third, this generates a struggle for existence as organisms compete for resources. Fourth, biological and behavioral variations that improve an organism's chances of survival and reproduction will gradually spread through the population. (The struggle for

existence selects useful traits, analogous to the artificial selection practiced by stockbreeders and horticulturists for producing new strains and varieties.) Fifth, the cumulative effects of natural selection over long periods of time account for the emergence of new species and the extinction of others.

Darwin's theory contained a number of ambiguities that made it a looser, more eclectic theory than it became during the twentieth century. Two are particularly important for understanding Social Darwinism. First, although Darwin believed selection acted on individual organisms, he sometimes argued that selection operated on groups, and many of his supporters favored various forms of group selection. Second, Darwin could not explain how variations occurred—genetics was not established until the early twentieth century. The French naturalist Jean-Baptiste Lamarck had claimed that variations occurred because organisms acquired new traits in their efforts to adapt to their environments. Darwin was critical of this theory, but many evolutionists accepted it as a mechanism complementing natural selection, and Darwin eventually acknowledged some role for the inheritance of acquired characters.

Early Social Darwinism

Darwin's theory is underpinned by the belief that all nature is governed by fixed laws; hence, human biology had also evolved by natural selection from a prehuman ancestry. Social Darwinism takes an additional step, arguing that human history, psychology, and culture have also evolved through natural selection. Darwin endorsed this view in his *The Descent of Man* ([1871] 1981) and in *The Expression of the Emotions in Man and Animals* ([1872] 1998), but his notebooks show that he had held it for many years before the publication of the *Origin*. It is important to recognize, however, that endorsing Darwin's theory of biological evolution does not necessarily entail support for Social Darwinism.

Darwinism rapidly became both influential and controversial, as people grappled with the implications of human culture and behavior being governed by the struggle for existence and the “survival of the fittest”—a phrase coined by the influential philosopher Herbert Spencer and adopted

by Darwin from the fifth edition of the *Origin* (1869). Spencer argued that primitive humans were organized for warfare, but as societies became larger and more complex, warfare was gradually replaced by economic competition as a selective mechanism. Although this competition was peaceful, it was as rigorous as warfare in selecting the fittest individuals. Spencer argued that it was vital for evolutionary progress that individuals were subjected to the discipline of market forces and competition, which required a state limited to the functions of protecting individuals from crime and foreign aggression. He opposed state policies for improving welfare and living conditions because he believed they relieved individuals from the responsibility of supporting themselves in the struggle for survival. Yet Spencer also passionately opposed militarism and imperialism as symptoms of evolutionary regression because they reverted to the morality of earlier stages of evolution when warfare and conquest were the norms.

Some Social Darwinists, however, did consider warfare and conquest to be necessitated by the struggle for existence because the earth's resources were limited, and this limitation would produce conflict among groups—for example, among tribes, nations, or races. Racial conflict in particular has become closely associated with Social Darwinism, although the idea preceded Darwinism. Initially a loose term, race gradually became identified with biological characteristics (e.g., skin color), and races were ranked along a scale of putative inferiority and superiority with white races as the most advanced. Social Darwinism was appropriated by many racial theorists who believed it conferred scientific validity on their conceptions of a world governed by incessant racial conflict with “superior” races constantly menaced by “lower” races who, through sheer numbers or by racial mixing, threatened the survival of the former. This message was emphatically delivered in the publications of the French Social Darwinist, Georges Vacher de Lapouge (e.g., in his *Les Sélections sociales* [1896] and *L'Aryen* [1899]). Though adamant that the “Aryan” race was superior to all others, Vacher de Lapouge believed it was doomed to extinction in inevitable and imminent racial warfare unless draconian eugenic measures were instigated to maintain its racial purity.

The eugenics and racial hygiene movements that proliferated during the early part of the twentieth century articulated similar concerns, which were

closely linked to Social Darwinism. Declining birth rates among the middle classes in the industrial nations provoked fears of racial decline and vulnerability in the struggle with other nations for markets and resources. Measures were advocated to encourage the breeding of what they considered the fittest members of society and to prevent the proliferation of the unfit—a heterogeneous category that included criminals, vagrants, alcoholics, the congenitally sick and mentally ill, and sometimes the entire working class. Perversely, modern civilization—with advances in medicine and humanitarian concern for the indigent and infirm—had produced a contra-selection favoring the unfit over the “superior” members of society. The healthy consequences of natural selection should be restored by measures aimed at encouraging the breeding of the fit and preventing the reproduction of the unfit, the latter encompassing segregation, sterilization, and in certain versions, elimination. In these forms of Social Darwinism, fitness was no longer identified with reproductive success but with preconceived ideas of superiority deriving from class and ethnic prejudices.

Eugenics and Social Darwinism were combined with horrendous consequences in Nazi Germany between 1933 and 1945. Adolf Hitler argued that human existence was dominated by the need for food to preserve the individual and the need to procreate to preserve the race. Since resources were finite, there ensued a relentless struggle for existence between races, and the victors were those who maintained the purity of their blood. Since racial characteristics were biologically determined and unalterable by socialization, racial purity could only be maintained by eliminating the sick and the morally unacceptable members of one’s own race, preventing mixing with lesser races, and exterminating the most inferior, most notably the Jews. The Nazi policies of warfare, conquest, euthanasia, and genocide were justified in these terms.

However, Social Darwinism was also used to oppose doctrines of racial conflict. In 1863, an American clergyman, Charles Loring Brace, published *The Races of the Old World. A Manual of Ethnography*, which insisted that although races had evolved through natural selection, race relations were not necessarily antagonistic and racial differences could not be interpreted in terms of superiority and inferiority. Brace challenged prevailing racial stereotypes and strictures against the mixing of races by combining

Darwinism with Lamarckian notions about the role of the environment in evolution, insisting that social structures and behaviors could play a powerful role in influencing the fortunes of ethnic groups. In America, mulattos, Negroes (as African Americans were then usually termed) and Native Americans were declining due to the predatory and discriminatory actions of whites and the effects of alcohol, drugs, tobacco, diseases, and the destruction of game as the causes, rather than any innate inferiority. All races could interbreed, and mixed races were not necessarily inferior, physically or mentally. Blacks could live peacefully with whites, and the American Negroes would benefit from the abolition of slavery. Brace's version of Social Darwinism established an optimistic and humanistic picture of race relations that contrasted sharply with the views of Vacher de Lapouge and Hitler.

It is misleading, therefore, to conflate Social Darwinism with particular ideologies such as racism, eugenics, and apologies for predatory capitalism. Indeed, from its inception it was very closely connected with radical and reform movements such as feminism, pacifism, and socialism. Many socialists regarded Darwinism as the scientific foundation of their theory, and it has been argued that for a time Darwinism was integral to late nineteenth- and early twentieth-century socialism. Generally committed to the goals of peace and equality, socialist thinkers accommodated the struggle for existence by arguing that it had evolved, with capitalist competition as its most virulent but final manifestation. For some theorists, selection now acted on the brain, with the result that competition took place in the realm of ideas—in art, technology, science, and morals. Others, such as the German socialist August Bebel (whose enormously popular *Woman in the Past, Present and Future* [1879] had gone to fifty-three editions by his death in 1913), accepted that the struggle for existence was endemic throughout nature but that humans had evolved their rational faculties to the point where they were now capable of controlling their environment. Socializing the means of production, eradicating poverty, and promoting equality would remove the threat of overpopulation that engendered the survival of the fittest.

Bebel also used an evolutionary argument for the emancipation of women. Among early humans, the sexes were equal, but the periodic dependency of

women on men during pregnancy became transformed into permanent subjugation. The putative mental and physical inferiority of females was, therefore, not natural but was the result of social conditions of exploitation and oppression and the lack of education and occupational opportunities. These conditions would be eradicated by socialism, removing the inequalities between the sexes. A similar argument was advanced by the first French translator of Darwin's *Origin*, Clémence Royer, in her *Origine de l'homme et des sociétés* (1870). Royer was a committed feminist prior to becoming acquainted with Darwin's work but was quick to use Darwinism to support equality for women and liberal reforms. Yet although she believed that sexual inequality was the product of outmoded and unjust social practices, both in the *Origine* and her provocative preface to her translation of Darwin's *Origin* (1862), Royer insisted that racial and class inequalities were biologically determined and endorsed eugenics.

Darwinism, in addition to providing important elements of reformist, socialist, and feminist thinking during the late nineteenth and early twentieth centuries, also inspired a pacifist body of thought that has been described as a peace biology. Its practitioners often argued that warfare was contra-selective, destroying vigorous young men and leaving reproduction to those unfit to fight, a perspective that was widely held among pacifists. It is misleading, therefore, to identify Social Darwinism with apologetics for unregulated capitalism, imperialism, militarism, or racism because it was employed by thinkers from across the ideological spectrum.

Modern Darwinism

Although Darwin's theory constitutes the foundations of modern evolutionary theory, it has been modified during the course of the twentieth century. After experiencing something of a decline during the first two decades of the twentieth century, Darwinism was revived between the late 1920s and early 1940s by a synthesis with genetics and discoveries in paleontology. Subsequent developments—the discovery of the structure of deoxyribonucleic acid (DNA) and major advances in microbiology, new mathematical tools, computer simulations, and data from the study of animal behavior and the fossil record—reinforced natural selection as the mechanism of evolution.

These developments also boosted the focus upon individual organisms and genes as the units of selection, while group theories of selection became less popular. Evolutionary fitness became defined as the ability of an organism to pass its genes into the next generation. Hence, the unconscious goal of each organism is to maximize the number of its genes in the next generation. Fitness is defined by the degree of success in achieving this goal. This theory was widely popularized by Richard Dawkins's book *The Selfish Gene* (1989), which argues that individuals are genetically programmed to be selfish. This theory does not mean that genes cannot be overridden, but humans must be taught to be altruistic. Some eminent biologists, however, insist that in addition to the microlevels of gene and organism, selection can operate at the macro-evolutionary levels of groups and species and that evolution, far from being gradual and continuous, consists of periods of stability punctuated by bursts of rapid change. The details of these debates are beyond the scope of this entry, so the focus will be confined to gene selection, which has provided the inspiration and theoretical scaffolding of modern Social Darwinism.

Modern Social Darwinism

Social Darwinism fell into such disrepute after World War II as a result of its association with Nazism and racism that some historians pronounced it dead. In fact, Social Darwinism, though not widespread, persisted throughout the postwar period but was dramatically revived from the mid 1970s with the emergence of the disciplines of sociobiology and evolutionary psychology. Many of their practitioners deny that they are Social Darwinists because they are opposed to racist doctrines and unmitigated economic exploitation, but they actually subscribe to the defining premise of Social Darwinism, namely that Darwinian theory can be applied to human psychology, behavior, and culture.

These disciplines utilize theories of gene selection to argue that behavioral and psychological traits will evolve and persist if they enhance survival and reproduction. Rape, for example, has been explained as an evolved mating strategy of poor, powerless men who, denied access to women, unconsciously use it as a desperate means of perpetuating their genes. Homicide and assault have been interpreted as the consequences of

aggressive impulses that have evolved due to their success in the acquisition of resources and mates. The founder of sociobiology, Edward O. Wilson, in *On Human Nature* (1978), and evolutionary psychologist David Buss in his *Evolutionary Psychology* (2008) regard the division of labor between men and women (the former as breadwinners, the latter as child raisers and homemakers) as universal and natural, reflecting real psychological, genetically based differences between men and women rather than culturally determined roles.

These theories have also been applied to politics. Albert Somit and Steven Peterson, in *Darwinism, Dominance and Democracy* (1997), maintain that the existence of dominance hierarchies in many animal societies can be explained by the benefits they confer in establishing predictability and social stability, which in turn enhance the reproductive success of members of the group. Such hierarchies have then been appealed to explain the infrequency of democracy throughout human history. Warfare has also been depicted as a universal feature of all societies throughout history, undertaken to acquire resources, thereby augmenting the reproductive success of the victors.

Sociobiology and evolutionary psychology have attracted a great deal of criticism. Opponents have challenged their theories, the evidence used to support them, and their alleged social and political implications. The practitioners of these disciplines have been attacked for presenting phenomena such as sexual differences and homicide as biologically rather than culturally determined, thus ignoring the marked variations in murder rates and the position of women displayed by different societies and even within the same society over time. They have sometimes been accused of legitimating sexual and class inequalities and of implicitly denying the possibility of social change and political reforms by depicting human behavior, beliefs, and practices as fixed, as the product of innate, genetically programmed predispositions.

Modern Social Darwinists reject these criticisms, insisting that genetic predispositions are often easier to change than those induced by socialization: after all, people contravene their natural proclivities whenever they use contraceptives. Feminists who support evolutionary psychology,

such as Griet Vandermassen, in her *Who's Afraid of Charles Darwin?* (2005), argue that a knowledge of the ways in which our minds and behaviors have been shaped by evolution is a prerequisite for changing them.

Despite the controversies it has aroused since its appearance, the enduring appeal of Social Darwinism derives from its persuasive and accessible accounts of human nature, history, and society that claim the authority of science. Its persistence suggests it is likely to remain important in modern culture, while its history indicates that it will continue to be modified by developments in Darwinian evolutionary theory.

Democratic Centralism

Democratic Centralism

Democratic centralism was a term widely associated by Cold War anti-Communists with the alleged totalitarianism of Russian revolutionary Vladimir Ilyich Lenin. Political scientist Alfred G. Meyer's influential *Leninism* described it as Lenin's ruse for imposing his own will in the revolutionary party since "all discussion was suspect to him, because it was a waste of time and because it might threaten the unity of the party in action." In a similar vein, J. Edgar Hoover asserted in *Masters of Deceit*: "Democratic centralism is the basic principle of communist organizational structure—a term meaning, in actual practice, simple, naked, and unadulterated dictatorship." This is how the term is still commonly understood.

Actually, the term arose in the left wing of the German labor movement in the 1870s, according to Leonard Schapiro's *The Communist Party of the Soviet Union*. German socialism's uncompromisingly democratic Rosa Luxemburg, describing the German Social-Democratic Party as "the most enlightened, most class-conscious vanguard of the proletariat," called for what she described as "social-democratic centralism" or "the 'self-centralism' of the advanced sectors of the proletariat."

Within the Russian Socialist Democratic Labor Party (RSDLP), the breeding ground of Lenin's Bolshevik faction, his factional adversaries—the Mensheviks—first advanced the term. A 1905 Menshevik resolution asserted that "the RSDLP must be organized according to the principle of

democratic centralism,” that “actions affecting the organization as a whole . . . must be decided upon by all the members of the organization” and that “decisions of lower-level organizations [such as a party local] are not to be implemented if they contradict the decisions of higher organizations [such as a national convention].”

A later Bolshevik resolution, “recognizing as indisputable the principle of democratic centralism,” called for “the broad implementation of the elective principle,” adding that “while granting elected centers full powers in matters of ideological and practical leadership, they are at the same time subject to recall, their actions are given broad publicity, and they are to be strictly accountable [to the membership] for these activities.” Lenin summarized democratic centralism as “freedom of discussion, unity of action.” He felt that the revolutionary party “must be united, but in these united organizations there must be wide and free discussion of party questions, free comradely criticism and assessment of events in Party life.”

Knowledgeable historians concur with Moshe Lewin’s description in *The Making of the Soviet System: Essays in the Social History of Interwar Russia* (1985) of the Bolshevik party by 1917 as “a legal, democratic mass party” with a strong and critical-minded leadership layer, “well-connected with its rank and file and its following in the factories and barracks,” who sometimes differed with Lenin’s positions. If Lenin’s views were to prevail, he had to work through the normal procedures of party institutions to gain majority support—and more than once he was on the losing side of a debate.

After the Russian Revolution of 1917, however, and particularly in the face of the terrible calamities of 1918 to 1921 (foreign invasions, economic collapse, and a brutalizing civil war), the term came to be interpreted in increasingly authoritarian ways, particularly as the Bolshevik party, renamed the Communist Party, established a one-party dictatorship—presumably as an emergency expedient, but one that became permanent. Particularly with Lenin’s death in 1924, and the crystallization of a bureaucratic and authoritarian leadership under Joseph Stalin, the democratic elements of the concept were ruthlessly suppressed.

Stalin's summary of Lenin's theory of the party is consistent with the drive toward dictatorial power. He asserted that Lenin's theory showed "that the dictatorship of the proletariat may be complete only if it is led by a single party, the Communist Party; and . . . without iron discipline in the Party, the tasks of the dictatorship of the proletariat to crush the exploiters and to transform class society into socialist society cannot be fulfilled." With this approach, the democratic element involved rank-and-file discussion of how best to implement decisions made by the central leadership. This revision became the most influential conception in the mainstream of the Soviet and European communist movement from the 1930s onward.

Democratic centralism also became a key element in the thought and practice of Chinese communist revolutionary Mao Zedong, beginning in the 1920s, two decades before the Communist Party of China, led by Mao, came to power in 1949. Like Lenin, Mao took seriously the democratic component of democratic centralism in his speeches to the Party and in his policies in the Chinese countryside, where his peasant support helped him overcome the material advantages of Chiang Kai-Shek's Nationalists, supported by the United States.

For instance, in his 1927 speech "On the Rectification of Incorrect Ideas in the Party," Mao (1953) argued both that "the leading body of the Party must give a correct line of guidance" and that "inner-Party criticism is a weapon to fortify the Party's organization and increase its fighting capacity" (7, 9). As a cofounder with Lenin of the concept of "political correctness," Mao nevertheless urged his comrades to speak their minds openly in Party meetings without fear of retribution, although once a decision was made, they were expected to show Party discipline and toe the Party line in public. China scholars disagree about whether the violent excesses of the Mao's later Cultural Revolution (1966–76) reflected or contradicted his earlier policy of democratic centralism.

Democratic Theory

Democratic Theory

Given the contested nature of democracy as a concept, it might be suggested that it is better to speak of theories of democracies than democratic theory per se. Yet, on close examination there is a certain core of continuity in the debates on democracy in contemporary political theory, not only in the positive resonance of the idea of democracy, but also as a set of debates that revolve around varying triangulations, interpretations, and weightings of three core features of democracy: participation (or the question of institutional design and how the popular will can be identified, voiced, and channeled), accountability of government (or the question of legitimacy and how the practice of governance on an everyday basis can be made accountable), and equality (or the issue of what shared status, opportunities, and/or recognition is required for participation to be meaningful).

Justifications for Democracy

The question of democracy versus nondemocracy may appear to be largely settled in theory, as long as one accepts that democracy is the one form of regime design and practice that instantiates both broad, meaningful, consultative mechanisms and legally enforceable protections for minorities. From the perspective of practice and history, democracy appears as the outcome of a process of contestation against the tendency of elites and established public authorities to concentrate and abuse their power. In

theory, more positive justifications include the arguments that popular judgment in relation to public policy, if institutionalized thoughtfully, can often be of better quality and less corrupt than the judgment of the few (e.g., Aristotle's *Politics*, Niccolò Machiavelli's *Discourses*, John Locke's *Second Treatise*, the Marquis de Condorcet's *Probability of Majority Decisions*); that collective self-rule is the best, if not the only, way to ensure political liberty as autonomy (e.g., Jean-Jacques Rousseau's *Social Contract*); and that democracy has the best potential as a regime to ensure recognition of the dignity of all as a minimum requirement of political justice, and even to promote global peace (e.g., Immanuel Kant's *Perpetual Peace*).

The first well-documented practice of democratic governance is that of ancient Athens in the fifth century BCE, and because of its primacy, it has become a continuous reference in discussions on democracy, though it remains subject to a great deal of interpretative dispute (e.g., Josiah Ober 1998; Mogens Hansen 1991). Nonetheless, Athens is regarded as having a somewhat paradoxical relationship to democracy. The citizens of Athens were granted a great deal of legislative power and influence in the determination of policy, but there was no possibility of citizenship for women, children, slaves, and anyone not born of Athenian parentage. Faced with the question of how to design modern democratically inspired institutions in an age of commerce and larger states, theorists of the late eighteenth and early nineteenth centuries, such as Benjamin Constant, developed a theoretical defense of representative democracy. The general thrust of the ideas was to allow for shallower expressions of popular participation than was the case in ancient Athens, where being a citizen was almost a full-time job, while widening the eligible public and repudiating exclusionary and oppressive policies associated with ancient practice.

Democracy as a Question of Popular Participation and of Institutionalizing Representation

In modern democratic theory, debates surrounding participation focus on the general question of how best to structure and institutionalize popular input and on more specific questions of how to conceptualize and organize democratic representation. Stances on the issue of institutional design in

democracy cover a broad spectrum and reflect differing concerns over the potential weaknesses of granting political powers to a vast public. On the one hand stand those theorists who are somewhat wary of popular judgment and who therefore defend perspectives that ensure that the power of the people is either muted institutionally or directly checked so that its potentially damaging effects will be minimal. In this camp, broadly speaking, fall defenders of liberalism and constitutionalism in its democratic form who stress the need for functionally separated powers checking one expression of the popular will against another and a set of laws with special status and effective judicial institutions that can protect the rights of minorities in the face of popular zeal in legislation (e.g., James Madison, John Stuart Mill, Stephen Holmes, Jeremy Waldron). Increased wariness of the popular voice is also expressed in the Schumpeterian view that through the election of elites, the people effectively delegate their capacity for substantive political judgment.

On the other side of the spectrum are those who embrace deepening and strengthening the voice of the public will. While not eschewing certain liberal demands for entrenched bills of rights and other checks to protect minorities, an emphasis on making the practice of popular participation more meaningful with recourse to the value of liberty leads some of these thinkers to be called republican (Phillip Pettit 1997; Michael Sandel 1996). Others promote the deepening of democratic practice for reasons of equality and for the protection of the people against the ambitions of elites and to ensure as wide an effective class of citizens as possible. These are sometimes called proponents of strong democracy (e.g., Benjamin Barber 1984). Demand for greater trust in the voice of the public is often accompanied by a concern for better modes of citizen education or for an increase in the transformative capacities of civil society (Sandel 1996; Robert Putnam 2000). Some advocate increased recourse to mechanisms such as plebiscites, referenda, primaries, recall of public officials, and citizen assemblies (James Fishkin 1997) or less emphasis on the courts to decide matters of public policy (Ran Hirschl 2007). Other radical democratic proposals include the filling of certain categories of public office through lottery (such as is the practice for selection for jury duty in many contemporary democracies) and the establishment of popular tribunes so as to more adequately ensure that all citizens have an equal opportunity

of serving in a public capacity, given the essentially elitist and biased nature of election as a selection mechanism and the consequent tendency of public policy to favor the wealthy (John McCormick 2011). Ted Becker and Christa Daryl Slaton (2000) propound a system of teledemocracy that would utilize electronic media to inform, to connect, and to give a direct voice to citizens. At perhaps the farthest end of the spectrum stand Rousseau and those inspired by his work, who hold that only direct democracy—that is, the people themselves acting as legislators with few formal constraints—can fulfill the necessary conditions of democratic practice.

Alongside the question of constitutional design and the degree and nature of popular input to entrench are the questions of the ways in which the wishes of the people are aggregated and represented. Apart from defenders of direct democracy in the line of Rousseau, all democrats need to come to terms with how to identify an effective and legitimate mechanism of voicing and aggregating popular demands. Representation can be considered at the level of interests, among sociological groups, or as the aggregation of individual preferences in constituencies. Pluralist accounts of democracy favor an understanding of politics as the competition among various interest groups for both the support of the public and access to makers of policy (Robert A. Dahl 1998; David Truman 1951). The role of democratic politics, then, according to pluralists, is to regulate and settle the conflict of interests in a way most conducive to the peace and good governance of the whole. The degree to which this goal is deemed possible is related to how much those interests balance each other, ensuring that none dominates, and to which the various sets of citizen interests are crosscutting rather than reinforcing. Still, the approach has often been criticized for ignoring the degree to which certain interests, and most prominently economic ones, have been protected and entrenched within the system of governance itself. The classic pluralist account of group representation may seriously neglect the structural protection of special interests, protection that may limit the degree of democratic input possible.

As an attempt to restructure and deepen democratic practice, some theorists have suggested the need to institutionalize and empower certain sociological groups in society whose voices might be ineffective in a

classical pluralist scenario. This type of group representation in practice and in theory has taken several forms. Consociational democracy, as practiced in a number of northern European countries, seeks to institutionalize formal accommodation of competing ethnic and/or religious communities as a form of power sharing agreement (Arend Lijphart 1997). It assumes a society characterized by one or a few main cleavages dividing the population into two or more relatively equally powerful groups, the accommodation of which is best managed by community elites. It served as a model for democratic governance in the rather stable social climate of the mid-twentieth century, but it can be considered less appropriate as a descriptive model given vast changes in the sociological makeup of European communities and the recognition of vast diversity supplanting the former primary salience of very broad and homogeneous categories of religion and ethnicity.

Group representation has been advocated more recently as a corrective to the defects of traditional representative democracy, particularly in light of multicultural theory. While some theorists support claims to political autonomy by traditionally oppressed nationalist groups, such as aboriginals in the Canadian context (Will Kymlicka 1995), others decry nationalism but suggest that traditionally oppressed or disadvantaged groups, such as ethnic minorities or underprivileged classes, be offered chances for more representation in legislative bodies (Melissa Williams 1998) or be given institutional veto power over legislative proposals deemed to compromise their well-being (Iris Marion Young 1990). Still, the diversity of the interests in these traditionally disadvantaged groups, given different genders, ethnicities, and ascribed races, makes the question of who will actually speak in their interest and how that interest is defined a complicated one. Young's defense of this mode of representation suggests that the perspective offered by individuals in these groups has been traditionally ignored in liberal democratic policy making and that these sorts of institutional arrangements would make up for the defects of assuming that conditions for democratic representation are met by representing interests and opinions alone. So the issue of how best to represent the voices of democratic citizens is intricately bound up with questions of what is or should be represented.

The form of representation most commonly invoked in the literature on democracy is that related to representational government, a system of governance whereby individuals elect legislators to make policy on their behalf. The question of what it means to represent is central to the question of how good this system of governance and policy making is. For some, the mere act of consent, through the process of voting, is enough to deem the winner of that electoral process a legitimate representative of the people. In practice, the nature of representation on the part of the elected official swings back and forth between a trustee model, whereby the elected official makes decisions deemed or legitimated by appeal to be in the best interests of the constituents even while ignoring the directions of public opinion, and a delegate model, wherein the actual content of public opinion is taken seriously and used as a guide for decision in matters of policy. (This difference is what Hanna Pitkin [1990] has called the mandate-independence controversy.) Politicians may follow the latter approach for purely instrumental purposes of getting reelected, thereby serving the purposes for which the practice of regular elections was instituted, namely, helping to ensure the accountability of local officials.

Others suggest that more legitimate representation in a democratic context must go beyond the policy makers' sense of their relation to the interests of their constituents and enter into deeper sociological continuity between the public and the legislative body. In practical terms, this approach would require that legislatures be bound to certain rules in order to increase the presence of members from traditionally underrepresented groups such as women, minority nationalities, and underclasses, such as in recent laws in France to encourage *parité*. This theory is underpinned by the assumption that policy that is formulated by a more diverse set of legislators will be a more just policy, helping to channel funds more equitably across society and ensuring that the interests of minority communities will be more effectively protected.

Another mechanism suggested that could enhance the diversity of interests and opinions represented, if not wider sociological perspective, is the adoption of electoral laws that temper institutional tendencies to reward one party or coalition in disproportionate terms to its electoral result by creating artificial majorities. The most common of these correctives is proportional

representation (PR), which in broad terms ensures that each political party will be granted roughly the same proportion of seats in a legislative body as the amount of electoral support it was able to achieve. Debates concerning the efficacy and desirability of a form of PR revolve around one of the key questions of democratic theory, namely the relative importance of representativeness, however conceptualized, for a well-functioning democratic system. There is a certain dilemma for those who defend PR as a means to enhance democracy because it often requires coalition governments. Detractors suggest that coalition governments are unstable and greatly decrease governmental accountability, given that policy stances are no longer primarily driven by longstanding and public commitments but by the mechanics of interparty bargaining and compromise.

Democracy as a Process of Ensuring Accountability in Governance

A focus on accountability highlights the question of democratic processes. Issues related to institutional design and to the nature and mode of popular representation tend to circle around a notion of democracy as a blueprint or set of ideas and institutions that, once settled on, can maximize popular rule in an effective way. However, other theorists conceptualize democracy as less a set of established institutions than as a set of processes governed by some established rules that leave the institutional setting more open to democratic contestation. These theorists, who prioritize accountability, focus on the processes both before and after voting through which citizen opinions and interests are expressed and adjudicated.

One important and growing field of democratic theory in this regard is deliberative democratic theory. Inspired first by the work of Jürgen Habermas, theorists of deliberative democracy such as James Fishkin stress the importance of discussion and explore the process by which opinions are formed, expressed, and transformed in the course of exchange in public debate. Public discussion arguably brings participants to think more clearly about the justification for their preferences in terms of public reason or a set of reasonable arguments that all or a majority of citizens could accept. In addition to enhancing democratic accountability, deliberation is defended

for its capacity to deepen democratic legitimacy in an age of skepticism regarding the claims and effectiveness of public institutions. It is also supported from a Hegelian perspective in its potential to facilitate the process through which citizens mediate between their individual ethical commitments and their obligations and identities as members of a broader polity.

An array of both normative and empirical studies explores the effect of different forums and structures of deliberation and the degree to which deliberation may and should shape and transform political preferences and perceptions of self-interest, increase solidarity and strengthen the position of traditionally marginalized groups, help citizens to overcome their differences, and produce results that are reasonable and potentially effective (Simone Chambers 2003). A central issue in this literature is the manner and hence the degree to which popular sovereignty is normatively defended in relation to a rights-based theory setting limits on both what can be said and what can be deemed to be a legitimate outcome of discussion (Seyla Benhabib 1996; Carol Gould 1988). Also important is the question of what counts as public reason and how to judge the place of rhetoric and appeal to emotion that are pervasive in most practices of political discussion.

Should deliberative democrats reject emotional appeal in politics as violating essential norms of good deliberative practice as reason-giving, or seek a more sophisticated account of both emotion and reason that can more readily reflect the realities of public debate (Sharon Krause 2008)? It is generally acknowledged that fully democratic deliberation must allow the very rules of discourse to be subject to free and equal discussion and decision making (Benhabib 1996; Bernard Manin 1997).

This focus on enhancing the accountability of public power through an emphasis on the democratic process through which decisions may be more legitimately reached or consented to has also led to a rethinking of the traditional institutional structures commonly associated with liberal democratic thinking. Some have defended a grassroots conception of decentered democracy, meaning that the forces of contestation and demand for public accountability come from a variety of groups with a diversity of motivations and minimal organization and with a wide variety of targets

that can span from demands for accountability in the workings of international organizations (such as protests at the annual G20 summits) to voicing of concerns over policy at the local level.

Beyond the bounds of the public sphere associated with the liberal democratic state, where demands for accountability still remain the best organized, theorists have voiced a postnational conception of deliberative democracy in a number of ways. Daniele Archibugi and David Held (1995; Held 1996) defend a model of cosmopolitical democracy in which practices of accountability, direct popular representation, and consultation are infused throughout the international system. Others suggest accountability is better effected through nongovernmental organizations and a strengthened global public sphere (James Bohman and William Rehg 1997; John Dryzek 2000).

Perhaps sharing the deliberative-democratic concern for public accountability, but not sharing the premise that public matters can be settled by a process of reasonable accommodation, are theorists of radical pluralism, or agonistic democracy. Ernesto Laclau and Chantal Mouffe (1985) regard politics as inevitably antagonistic and as a struggle for power; they seek to enhance democratic politics with greater recognition of the value of conflict within liberal democratic constraints. On a somewhat different plane, William E. Connolly (1991) recommends a vision of nonfoundational agonistic democracy in which individuals engage politically based on their sense of identity but with an attitude that ensures that those identities stay open to ongoing questioning and contestation.

Democracy as a Lived Practice of Equality With Others

In theory, a just practice of deliberation needs to presume an underlying equality among the participants so that the preferences of each at the start are on an equal footing and so that it is the force of argument or persuasion that determines the outcome of discussion rather than underlying power dynamics (Habermas 1998). Many theorists who stress the centrality of equality for democracy, over and above the values of participation and accountability, tend to be wary of both formal institutional and

accountability models of democracy and hence explore the more informal social and cultural mechanisms that shape identities in order to ensure that democratic participants can have an equal say. From this perspective of democratic theory, barriers to effective equality can be conceptualized through a number of lenses that include differential socioeconomic status, gender differences, and multicultural differences as well as citizenship status as regulated by the state. Equality can be regarded as a good in itself as well as an instrumental good necessary for the exercise of proper autonomy and individual dignity. It can be conceived as democracy's precondition as well as its ultimate policy goal.

Views of what equality looks like and how it is best achieved differ significantly and are often broached with a particular feature of individual identity in mind. Multicultural theorists have often settled on the idea of recognition as an important component of equality within democratic practice (Amy Gutmann and Dennis Thompson 1996; Charles Taylor 1994). At its core, recognition involves an acknowledgment of the dignity of others and of their worth not just as human beings, but for the substantive commitments their lives embody with each individual having a particular identity. In certain cases, recognition may require a granting of group autonomy or forms of self-government, as in the case of some aboriginal peoples. In other cases, the demands of recognition might be met through the granting of specific privileges or rights, or its reverse that is a guarantee of impartial and undifferentiated treatment. Because of the need for attunement to cultural difference and specificity that a theory of multiculturalism embodies, theorists of this school tend to eschew universal prescriptions and seek to promote equality through a diversity of measures that are judged to best meet the concerns and challenges of the group considered. Still, a certain paradox rests at the core of much of multicultural theorizing. Attentiveness to the well-being and equal stake of all members of the political community makes the question of what is to the good of all more complicated if not irresolvable and makes it more difficult to identify what if anything binds members of the larger political community together. Left unresolved are the purported equal rights of different cultural groups to deny the equal rights of individuals (e.g., women) within their own group

Theorists of democracy with a view to gender equality often look to the structures of the family and private sphere as the cause of women's inequality in economic and public life. Susan Okin (1989) criticized theorists of liberal democracy for ignoring the family, advocating a rethinking of traditional roles at home as a necessary condition for equality at the level of the state. This stance has been accompanied by demands for greater participation of women in the political process and a desire to see a larger number of women in political office. In general terms, feminists have made important contributions to democratic theory in leading theorists to acknowledge that power relations within the private sphere have a significant impact on the functioning of the public sphere and its outcomes. Feminists have also led democratic theorists to recognize that the granting of civil and political rights is not a sufficient condition for effective equality, but a necessary one. From a care feminist perspective, democratic equality is not only about the just distribution of political entitlements but about, even more importantly, having citizens accept one another as fully fledged and equal members of the same community with acknowledgment of some responsibility for the well-being of the others. A more radical feminist approach to democratic theory and practice rejects any definitive account of what liberation for women might look like and instead builds solidarities with other groups regarded as oppressed and seeks democratic experience in a practice of shared resistance. These two feminist perspectives share a communitarian component that transcends the individualist emphasis of liberal feminism.

Another important field of the literature on democratic equality, though less a focus than it once was, explores the dysfunctional impact of class differences and economic inequality on democracy (Anne Phillips 1999). Theorists have highlighted the inability of liberal democratic states to minimize the income gap, thereby increasing the gap in life chances among different classes, a trend exacerbated by a set of global fiscal crises that have debilitated the welfare state. The existence of a permanent underclass undermines the possibility for democracy in the state because it makes it virtually impossible for citizens to see themselves as participating in a common political project of their own making in which they stand as equals (Dahl 1998). This challenge was acknowledged by Aristotle in his

discussion of the mixed regime, and it may well stand as the most enduring challenge to democratic practice in the long run.

Conclusion: The Future of Democratic Theory

The contours of contemporary democratic theory are very broad and complex as they not only cover competing understandings of what democracy is or should be, but also include a wide range of practices and mechanisms through which these various goals can be furthered. Despite the usefulness of distinguishing democratic theories in terms of participation, accountability, and equality, these and other aspects of democracy in fact overlap. A number of theorists recognize the need to reflect and advance democratic practice on different planes simultaneously.

In many ways, the field of democratic theory today is almost synonymous with most of contemporary political philosophy, not only in the Anglo-American world but increasingly in other parts of the world as well, as reflected in the prodemocracy movements beginning in 2011 in North Africa and the Middle East. Possible directions for democratic theory in the future involve greater attention to the expansion of rights, benefits, and privileges to classes of citizens or community participants still marginalized in the political process, including immigrants, children, future generations, and the natural world, and the development of more imaginative ways that we might deepen the democratic process and make public institutions more accountable.

Dewey, John

John Dewey was an American philosopher and social theorist known chiefly for his application of educational theories, especially pragmatism, to ideas of democracy. Dewey was born October 20, 1859, in Burlington, Vermont. He received his bachelor's degree from the University of Vermont in 1879 and then taught high school in Pennsylvania and Vermont for three years before beginning graduate school. In 1884, he received his PhD in philosophy from Johns Hopkins University. His first academic positions were at the universities of Michigan (1884–88, 1889–94) and Minnesota (1888–89). In 1894, Dewey moved to the University of Chicago, where he taught philosophy, psychology, and pedagogy and where he founded the Laboratory School to put his educational philosophy into practice. Most of his academic life, from 1904 until his retirement in 1930, was spent as a professor of philosophy at Columbia University. He lectured in Japan in 1919 and in China from 1919 to 1921; he encountered much intellectual resistance in the former country but at least reached wide audiences in the latter. In 1937, Dewey served as chair of the commission in Mexico City that investigated the charges of treason and murder brought in Moscow against Leon Trotsky, who was then in exile in Mexico; Dewey was careful to distinguish his political thought from Trotsky's communism as he led the commission to a finding of not guilty. His published writings include many articles on contemporary events for *The New Republic*. Engaged intellectually almost until the end of his life, he died June 1, 1952.

Pragmatism

Dewey was initially persuaded by Georg Wilhelm Friedrich Hegel's philosophy, according to which the world is the actualization or appearance of the absolute spirit and the study of the human mind is a means to the study of the absolute spirit. By 1903, however, Dewey became associated with a school known as pragmatism, which teaches that humans are to be studied on their own terms and for their own sake (*Studies in Logical Theory*). His pragmatism is ultimately a theory of how we come to have knowledge (*How We Think* and *Logic: The Theory of Inquiry*). That theory articulates the scientific method, which Dewey often calls the method of intelligence. Thinking arises in order to resolve a problematic situation. A thinker formulates a hypothesis that he or she believes will solve the query, and he or she transforms the situation through observation and experimentation to test the hypothesis. The hypothesis may be declared tentatively true if the problem has been resolved to his or her satisfaction. Unlike Niccolò Machiavelli or Karl Marx (in their different ways), Dewey does not want to give the impression that all thought is for the sake of action; scientific reflection may find its consummation in aesthetic experience (*Experience and Nature* and *Art as Experience*). But he credits Francis Bacon with initiating the modern spirit by equating knowledge with power. Knowledge is always subject to revision, according to Dewey; to be dogmatic is to fail to cope with a universe in constant flux (*The Quest for Certainty*).

Democracy and Socialism

Democracy is central to Dewey's political thought, partly because he sees a close link between it and science: both require, and even champion, free inquiry and communication and the toleration of different opinions (*Freedom and Culture*). The advancement of knowledge occurs when scientists share their results; science depends upon socialization. Conversely, science can make political liberty more effective by increasing citizens' ability to achieve their purposes; the scientific method should be used to solve moral and political problems, as well as physical ones.

Democracy is not merely a form of government, but rather a moral ideal that should be realized in all spheres of life, including family, school, industry, and religion. The democratic ideal comprises the participation by each person in setting goals and the full contribution of each person toward fulfillment of goals. The overall aim of the democratic ideal is growth, which is “the only moral ‘end.’” Growth consists in a person’s continual movement from the stage of acting according to habit, to the stage of reflecting upon the meaning of that habit, and finally to the stage of choosing to act according to a higher, or more thoughtful, habit. “Not perfection as a final goal, but the ever-enduring process of perfecting, maturing, refining is the aim in living” (Dewey 1982, 181).

Democracy does not entail opposition to all authority because authority can be necessary for the promotion of personal liberty. For example, in education, where Dewey exerted his greatest influence (*Democracy and Education*), teachers are needed to guide children’s activities. Democratic aspects include designing the curriculum around children’s interests instead of imposing a rote series of studies on them, intermingling thought and action in the curriculum instead of separating them, and treating the school as a society in miniature instead of as mere preparation for adulthood. Education aims to form strong character in people and that occurs where participation in society is at its fullest (*Human Nature and Conduct*). For Dewey the entire purpose of education seems to be social. Schools are not the only, or the primary, means of education; the potential for education exists wherever there is communication, which serves to form and maintain the shared beliefs and practices that make community possible.

One major obstacle to that communication, in Dewey’s view, is the isolation of social classes from one another, particularly the separation of those who labor from those who reap the fruits of labor. Corporate capitalism, even as modified by President Franklin D. Roosevelt’s New Deal, entails fundamentally private control of the economy that entrenches power in the hands of a few. The solution is to give workers in all occupations control over the socioeconomic circumstances of their lives. At one time, Dewey thought that managing production through a federation of self-directing industries would attain that result. After the onset of the Great Depression, he concluded that greater socialization was necessary: large-scale public

works, redistribution of wealth by means of taxation, and public control of natural resources, banking, basic utilities, and the means of communication and transportation.

Liberalism and Equality

Despite Dewey's advocacy of socialism, the distinction between private and public is critical for his political theory: human transactions with consequences affecting only those directly involved are private, while those with consequences affecting others are public. The limits of the public sphere cannot be set in advance but must be determined experimentally. Actions that need to be regulated—encouraged or discouraged—can be known by “the far-reaching character of consequences, whether in space or time; their settled, uniform and recurrent nature, and their irreparableness” (Dewey 1984, 275). One implication is that no civic association may be considered forever beyond the bounds of public regulation.

Representatives and other public officials constitute the government, but the state also includes the public—or, more accurately, a collection of publics because Dewey defines a public as a group of people indirectly affected by the consequences of a transaction. Multiple transactions create multiple publics, and in a large, complex country, there are so many overlapping publics that often people are not even aware of the stake that they have in a particular issue. Thus, Dewey's main political goal is to help the members of a public identify themselves. Accomplishing that goal requires improving the conditions of public discussion—and prior to that, the conditions of inquiry. Much of the inquiry will be performed by experts, but citizens must be prepared to evaluate their work and, in the process, help to determine what policies make “the widest possible contribution to the interests of all—or at least of the great majority” (Dewey 1987, 56). Success, or growth, at this level can be measured in terms of the number and variety of people's shared interests as manifested in private associations and the extent of interaction among those interests. The promotion of that growth, not merely the prevention of harm, is the purpose of the state.

Dewey supports limited government for the promotion of personal liberty. Liberty is not merely the absence of restraint but is the “secure release and

fulfillment of personal potentialities which take place only in rich and manifold association with others” (Dewey 1984, 329). Dewey, thus, opposes the liberalism of Thomas Hobbes and John Locke, who take as their premise individuals with rights in a state of nature and who see the political state as the result of a social contract among its members. Social and political life is not served by such a distortion of history and psychology. Liberty never exists in the abstract but only in particular situations when someone acts to fulfill his or her potential. Furthermore, what is natural in humans cannot be entirely distinguished from what is acquired or learned. Human beings have innate needs, including companionship, aesthetic expression, and even combat, but there is no channel, such as war, in which those needs must inevitably be directed. The human mind itself is largely the creature of social institutions and customs—although through art and science a person may help to create his or her environment.

Individuals’ rights such as freedom of speech are important, but in order for them to be effective, the right of each person to be protected must be seen as being in the interest of all. Conversely, each person should see that it is to his or her advantage to work for the good of all. Although Dewey prefers to consider individuals’ rights in a social context, by 1939, there is a change of emphasis in his writings: from social life as a whole, with individuals subordinate, to the uniqueness of individuals and personal liberty, with the state as a means toward that end. He declares that the change was prompted by his opposition to totalitarian communism and fascism.

The full realization of liberty depends upon equality, defined as “the unhampered share which each individual member of the community has in the consequences of associated action” (Dewey 1984, 329). The effective ability of each person to participate in shaping consequences depends upon the participation by others. Dewey calls for equality of opportunity, not equality of results; the former requires that people’s differing educational, economic, and other needs be met, but not that everyone have the same amount of resources and power (*Ethics*).

Unlike Jean-Jacques Rousseau, Dewey does not posit direct democracy as a political ideal. Laws will not come from citizens themselves. But Dewey

does not insist on any particular form of political organization: “There is no sanctity in universal suffrage, frequent elections, majority rule, congressional and cabinet government” (Dewey 1984, 326). Dewey does not readily see adequate replacements for all of those institutions, but he is open to any political arrangement that will promote the liberty, equality, and growth of the members of a political community by means of public discussion. Throughout his writings on political theory (including *Individualism, Old and New*), however, he gives relatively little attention to institutional reform, preferring instead a more abstract analysis of political principles. One principle that he endorses is that political reform should take into account “occupational groups and the organized knowledge and purposes that are involved in the existence of such groups” so that the public interest will not be defined by the majority only (Dewey 1987, 50).

It is unclear how much direct involvement Dewey expects private citizens to have in political affairs. On the one hand, he writes that “the primary problem of the public” is “to achieve such recognition of itself as will give it weight in the selection of official representatives and in the definition of their responsibilities and rights” (Dewey 1984, 283). Dewey is aware that such work is already more than most citizens in modern democracies manage to do and that elected representatives cannot be expected to do much of it. On the other hand, he hopes that the development of strong local communities will make political matters more understandable and make it feasible for people to become involved. Moreover, democracy in education and industry should increase demands for political democracy too.

As to the particular purposes pursued by human beings, the precise content of their education, their exact economic and political organization—Dewey is determined not to repeat the mistakes of his philosophic predecessors by trying to specify those things in advance. The chief mistake of early political liberalism was that it did not perceive the relativity of all ideas and principles. To see the relativity of ideas is to understand that a single idea may be found in history either to have produced or to have prevented social change. Early liberalism did not understand that the idea of the individual with natural rights could be used not only to increase liberty, but also to curtail it: for example, the idea of the individual with a natural right to enter into contracts with others could lead to a society where it was deemed

illegitimate for government to aid the poor. Since then, we have learned from science—where further experimentation often overturns prior results—that the meaning and validity of ideas vary with the purposes for which they are used. Thus, Dewey concludes that there is an inherent connection between historical relativism and the scientific method. It is a difficult question whether Dewey may consistently assert that all ideas and principles are relative and that science progressively discloses the secrets of nature—a question that may motivate continued study of his multifaceted writings.

Dialectic(s)

Dialectic(s)

Dialectic(s) (ancient Greek *dialektikē*) is a form of argument or type of philosophy with roots going back to ancient Greece and that has been particularly influential in Hegelian and Marxist thought.

The term is used in a variety of ways. In the early (Socratic) dialogues of Plato, it describes a form of argument in which truth emerges from the clash of contradictory viewpoints. The term was reintroduced into modern philosophy by Immanuel Kant for whom it signified “the logic of illusion” by which contradictions arise when reason tries to go beyond the bounds of experience. Georg Wilhelm Friedrich Hegel, by contrast, regards dialectic as an inherent feature of rational thought. The contradictions that arise within Kantian and other nondialectical forms of philosophy point toward a deeper truth. This outlook is most systematically presented in Hegel’s (1969) *Science of Logic*. This is not a work of formal logic; it is a logic of categories, a work of ontology and metaphysics. Its most important tenets are that all concrete and determinate things are in relation and interaction with other things, that they contain contradictions and, as a result, are in a process of change and development.

Hegel uses this philosophy to comprehend concrete and specific aspects of human life, including society and its development. It implies that all phenomena must be understood in their interrelations and in their becoming and change, in terms of the contradictory aspects or forces that are at work within them. This basis has been a particularly fruitful for the understanding

of social life, politics, and history. For Hegel, all human phenomena are historical and must be understood in their development. Historical change is not arbitrary or contingent; it is lawlike and rational in its course. It is a progressive process that moves through a series of stages toward an end: the realization of spirit (*Geist*), freedom, and human self-consciousness.

Karl Marx was strongly influenced by Hegel's philosophy. His theory of history—historical materialism—shares many of Hegel's ideas. Marx, too, sees human reality as essentially dialectical and historical. Moreover, he sees its development as a rational and progressive process that proceeds through a series of stages. However, Marx rejects Hegel's philosophical idealism. Instead of seeing history as spiritual and teleological, he insists that material and economic influences are primary. The conflicting forces in terms of which historical development must be understood are, for Marx, the economic forces and relations of production. These manifest themselves socially and politically as struggles between social classes, and this drives society forward.

All hitherto existing societies have been made up of conflicting classes (except perhaps the earliest and simplest societies). Each stage, or mode of production, is characterized by different classes in opposition. For the most part, historical change is gradual, but it is also punctuated at times by revolutionary upheavals. For Marx, history is a materially progressive process. The present stage, capitalism, will ultimately be superseded by socialism and communism in which class divisions will supposedly be eliminated.

Marx wrote little about his philosophical approach. It was left to Friedrich Engels to spell it out in a number of works published after Marx's death (*Anti-Dühring*, *Ludwig Feuerbach and the End of Classical German Philosophy*, *Dialectics of Nature*). Engels specifies three laws of dialectic: unity of opposites, transition of quantity into quality, and negation of the negation. These are often criticized for reducing dialectic to simplistic formulae. Engels also treats dialectic as a universal philosophy that applies not only to the human world but also to nature. In this he is following Hegel, who also treats dialectic as a universal logic applicable to all concrete things. Many of the leading figures of orthodox Marxism

(Vladimir Ilyich Lenin, Mao Zedong) have followed Engels in this respect. However, the idea of a dialectic of nature has given rise to much controversy. Many other Marxists have argued that dialectical development occurs only in human and historical phenomena (György Lukács, Jean-Paul Sartre). In recent years, a school of analytical Marxism has attempted to interpret Marxism without any reference to Hegelian and dialectical ideas, but it is doubtful that Marx's ideas can be grasped satisfactorily in these terms.

Dicey, Albert Venn

Albert Venn Dicey (1835–1922) expressed the doctrines of classical Victorian liberalism with a brevity and clarity few others have achieved. A lifelong admirer of Jeremy Bentham, the exponent of utilitarianism, he believed fervently in individual liberty, the value of free markets, the removal of government restraints on personal conduct, and the abolition of religious tests for civic participation. Dicey took for granted the maxim that the government that governed least governed best.

Dicey was born to parents who embraced contemporary liberal values. Educated initially at home because of his fragile health, Dicey earned his bachelor's degree in 1858 at Oxford where he studied at Balliol College. After reading for the bar at the Inner Temple, he was called in 1863. Dicey enjoyed moderate success in legal practice, but it was only in 1882, when he won election to the Vinerian Professorship of English Law at Oxford, that he became a public intellectual of considerable influence.

The most famous synthesis of legal and political ideals appeared in Dicey's 1885 treatise *Introduction to the Study of the Law of the Constitution*. In this magisterial volume, still influential among common lawyers around the world, Dicey argued that the British constitution rested on three fundamental principles. The rule of law, as Dicey defined it, meant that each citizen enjoyed a presumptive freedom from government unless interference had a legal basis. Individuals enjoyed an equality before the law that government could not violate by arbitrary action. Next, Dicey

explained the sovereignty of Parliament in accord with the jurisprudence of John Austin, a major figure in the genesis of legal positivism, except that Dicey believed in political as well as legal supremacy. The constitution vested this authority in Parliament whose only restriction was the inability to bind its successors. Finally, conventions of the constitution, binding understandings about political conduct, depended ultimately on parliamentary authority. The constitution, as Dicey traced its history, guaranteed maximum liberty under law.

In 1905, Dicey published his other great political work, *Lectures on the Relation Between Law and Public Opinion in England During the Nineteenth Century*. To his great dismay, Dicey found that changes in public opinion had caused an increasing government intervention in daily life that he equated with socialism. The level of activity, though modest by later standards, nevertheless caused Dicey to lament the disappearance of individual freedom through government growth. Increased taxation, the rise in number and scope of parliamentary statutes, and the expansion of economic regulation subverted the principles Dicey had held all his life.

The one political issue, however, that occupied his greatest attention was Home Rule for Ireland. As the jurist who had made parliamentary sovereignty a principal feature of the constitution, Dicey opposed any attempt to weaken parliamentary authority. For Dicey sovereignty was complete and indivisible. The demand for a subsidiary parliament in Dublin with jurisdiction over internal Irish affairs would exempt one part of the United Kingdom from parliamentary oversight. From 1886 to 1922, the year of his death, Dicey increasingly despaired, for the ultimate establishment of the Irish Free State in 1922 violated his tenets of parliamentary sovereignty.

Dicey's exposition of his political ideals has attenuated since his death. With the entry of the United Kingdom into the European Community, with the potential for appeals to the European Court of Justice, Dicey would no doubt have concluded that parliamentary sovereignty had vanished. The enlargement of government in the twentieth century has eroded the assumption that only limited government could protect individual liberty; Dicey would never accept that government might actually enhance

opportunity and freedom. Finally, Dicey's insistence on the blessings of an unregulated free market would make him suspicious of all contemporary economic theories. In the end, therefore, Dicey will always deserve respect for the political ideals he so sincerely endorsed, but these Victorian values have vanished and with them, his relevance for modern politics.

Dictatorship of the Proletariat

Dictatorship of the Proletariat

The dictatorship of the proletariat refers to the temporary phase of democratic rule that the German theorist Karl Marx (1818–83) and many of his followers believed would need to follow the fall of capitalism in order to make the advent of a communist society possible. In *The Communist Manifesto* ([1848] 1967), Marx and Friedrich Engels (1820–95) claim that the route from capitalism to communism is not direct but will necessarily go through several stages. First, capitalism will inevitably collapse under the weight of its own internal contradictions as the condition of the oppressed and impoverished majority (the proletariat) becomes unbearable. In the wake of this collapse of capitalism, a battle for democracy would ensue between the desperate and dispossessed majority and the small class of increasingly wealthy owners of the means of production (the bourgeoisie); Marx hoped and expected the former would eventually win. During the next phase, which he later called the dictatorship of the proletariat, the victorious working class should use the coercive machinery of the state that had been wrested from the bourgeoisie to dismantle the capitalist system of private property and social and economic inequality, by force if necessary. Class conflict would continue as long as the bourgeoisie, although defeated politically, retained considerable economic power and actively resisted the “despotic inroads on the rights of property” by the proletarian state to complete the revolution. Political power, which Marx and Engels regarded in essentially negative terms as “merely the organized power of one class for oppressing another,” would be necessary until this

task was complete. Only then would it be desirable and possible for the state finally to “wither away” (Engels’s term) with the complete abolition of all classes, leading to the advent of a stateless communist society.

Marx used the term *dictatorship of the proletariat* in an 1852 letter to Joseph Weydemeyer (1818–66), in which he described it as part of the “transition to the abolition of all classes and to a classless society,” and in his *Critique of the Gotha Program* ([1875] 1947) to describe this period of revolutionary transformation between capitalism and communism. In *The Civil War in France* ([1871] 2001), Marx describes the Paris Commune, a working-class government that briefly ruled the city in 1871, in terms that roughly correspond to his idea of a dictatorship of the proletariat. Engels was even more emphatic on this point than Marx, writing in his 1891 introduction to the pamphlet: “Do you want to know what this dictatorship looks like? Look at the Paris Commune. That was the Dictatorship of the Proletariat.” Also, Engels stressed to a greater extent than Marx the need for the workers’ state to employ terror against counterrevolutionaries to ensure that the gains made by the proletariat would not be lost.

Marx regarded himself principally as an analyst of capitalism. Consequently, he wrote comparatively little about what he believed would likely succeed it. His comments on the transition to communism are therefore quite limited and sketchy, unlike his very detailed and extensive analysis of the workings of capitalism. He clearly viewed the victory of the proletariat over the bourgeoisie as a necessary but not sufficient step toward the establishment of a communist society, requiring the state (now in the hands of the workers) to institute sweeping reforms such as the redistribution of wealth and property through progressive taxation and death duties, the nationalization of farms and industries, the establishment of free universal education and health care, and universal suffrage as steps on the road to the eventual abolition of all classes and the final dissolution of the state as a coercive class apparatus. By the 1870s, Marx softened his position somewhat, allowing for the prospect of a peaceful transition to communism, particularly outside the industrialized capitalist states of Western Europe. However, he crucially did not specify how long the transitional dictatorship of the proletariat would likely last, and he played down the use of violence against the recalcitrant bourgeoisie, unlike Engels. In his 1891 introduction

to Marx's "Wage-Labor and Capital," Engels refers rather hazily to a "short transitional period involving some privation" between the fall of capitalism and the establishment of communism. This emphasis on the short, temporary nature of the dictatorship of the proletariat is consistent with the republican constitution of ancient Rome, which allowed for the office of dictator (*dictatura*) to permit one man to rule the city for short periods on behalf of the people in an emergency. Unlike the Roman dictator, however, Marx envisioned the dictatorship of the proletariat as democratic rather than as a temporary suspension of democracy by one man since the majority of the population are members of the proletariat. He believed that the transition from capitalism to communism would be a democratic dictatorship of one class (the workers) against another (the owners).

Marx's vagueness about the character and duration of the dictatorship of the proletariat meant that it would remain a point of bitter contention among socialists after his death, particularly in the twentieth century with the establishment of officially socialist states such as the Soviet Union and the Peoples' Republic of China. For example, Lenin (1870–1924), effective leader of the Soviet Union after the Russian Revolution of October 1917, made the dictatorship of the proletariat a central feature of his *The State and Revolution* ([1917] 1943) and his pamphlet "The Proletarian Revolution and the Renegade Kautsky" (1918), which advocates the use of violence by the proletarian state against the bourgeoisie. Fellow Bolshevik Leon Trotsky (1879–1940), People's Commissar of Military and Naval Affairs in the Soviet Union until 1925, endorsed Lenin's position in *Terrorism and Communism* (1920), arguing that the sheer tenacity of the bourgeoisie after the Russian Revolution (which was followed by a prolonged civil war) meant that state terror would have to be used as a weapon "against a class that, despite being doomed to destruction, does not want to perish." Both Lenin and Trotsky were reacting against what they regarded as the political naiveté of the moderate social democrat Karl Kautsky (1854–1938), who had condemned revolutionary violence for violating the sanctity of human life and attacked the extensive Bolshevik use of force in *The Dictatorship of the Proletariat* (1918). He argued that the only ethically legitimate means to achieve socialism was peacefully through the ballot box. In *Terrorism and Communism* (1919), Kautsky attacked the use of terrorism by the Soviet state, "which begins with the abolition of every form of freedom of the

Press, and ends in a system of wholesale execution, is certainly the most striking and the most repellent of all,” provoking the contempt of Lenin and Trotsky, who wrote polemics against him.

Joseph Stalin (1878–1953) succeeded Lenin as General Secretary of the Communist Party of the Soviet Union. Like Lenin, who had argued for the indispensable role of a dedicated vanguard party of radical revolutionaries to establish the dictatorship of the proletariat in Russia, Stalin identified the Communist Party with the dictatorship of the proletariat in his book *The Foundations of Leninism* ([1924] 1939). The 1936 constitution of the Soviet Union, drafted by a committee headed by Stalin (sometimes known as the Stalin constitution), declared the Communist Party to be “the vanguard of the working people in their struggle to strengthen and develop the socialist system” (article 126). This idea is unlike Marx’s view that it would be a form of democratic dictatorship based on a particular class (the proletariat) rather than on a particular party. Stalin also claimed that it would likely take a long time to break down the considerable residual power of reactionary forces after the revolution, whereas Marx did not specify how long it would last. These conceptual modifications to Marx’s position were made in response to the practical exigencies faced by the leaders of a socialist state, like Lenin, Trotsky, and Stalin, rather than as mere theories conceived from within a capitalist society, as in the cases of Marx and Engels.

Stalin’s successor, Nikita Khrushchev (1894–1971), was First Secretary of the Communist Party of the Soviet Union during the 22nd Congress of the Soviet Communist Party in 1961. The program adopted by this Congress departed significantly from Marx in declaring that

the dictatorship of the proletariat has fulfilled its historic mission and has ceased to be indispensable in the USSR from the point of the tasks of internal development. The state, which arose as a state of the dictatorship of the proletariat, has in the new, contemporary stage, become a state of the entire people, an organ expressing the interests and will of the people as a whole.

Such revisionism was harshly denounced as a hoax by the Chinese Communists, who rejected the concept of a state of the entire people existing after the dictatorship of the proletariat since Marx had said that every state has a class character. This Soviet Congress was the last attended by the Chinese Communist Party.

Diderot, Denis

Diderot, Denis

“There is no true sovereign but the nation; there can be no true legislator but the people,” wrote the French philosopher Denis Diderot (1713–84) in the opening to his *Observations on the Nakaz* ([1774] 1992), thirteen years before the drafting of the American Constitution. Diderot went on to demand that any constitution must begin with the words “we, the people” and that the sovereign must be judged by the same democratic laws as her subjects.

A proper appreciation of Diderot’s position was long hampered by the late publication and attribution of key works such as his *Observations on the Nakaz* and parts of Guillaume Raynal’s *Histoire des deux Indes* (1772–81), both occurring only in the twentieth century, and by a frequent lack of understanding of the historical and political circumstances of Diderot’s own life and work.

Diderot’s political convictions had undergone a long and dramatic development, from his early constitutional royalism and economic ideas in the physiocratic tradition to an increasing skepticism toward all forms of political power and its holder’s entitlement to rule. This position placed Diderot among the most radical political thinkers of the French Enlightenment.

Diderot was the editor of *Encyclopédie, ou Dictionnaire raisonné des sciences, des arts et des métiers*. Comprising seventeen volumes of articles

and eleven volumes of illustrations and published in Paris between 1751 and 1765, it is often regarded as the first modern encyclopedia and as an embodiment of Enlightenment ideals and aspirations. The work was intended to represent the most advanced state of contemporary knowledge in every discipline and to set forth the connections and interrelations among the various branches of knowledge. The *Encyclopédie* was initially coedited by Diderot and Jean Le Rond d'Alembert, until d'Alembert resigned from the project in 1758, leaving Diderot as the sole editor.

In his articles for the *Encyclopédie*, the philosopher predictably champions moderate opinions, even if he daringly begins his article "Autorité politique" with the sentence: "No man has received from nature the right to command others. Liberty is a gift of the heavens and every individual has the same right to enjoy it as he has to enjoy [his] reason." Power can have only two sources: tyrannical violence or consent. It is notable that already here, in 1751, divine right has no role to play. A prince must gain and deserve the free consent of his subjects as a basis for his authority. In a work submitted to hostile censors, this statement was as far as Diderot could dare to go.

In 1774, Diderot returned from his stay at the court of Tsarina Catherine the Great deeply disillusioned about the possibility of enlightened monarchy and angered by his own previous naivety. It was then that he wrote his most incisive political works.

In contrast to his erstwhile friend Jean-Jacques Rousseau, whose republic some thought later provided a blueprint for totalitarian dictatorship, Diderot rejected the tyranny of virtue in his *Observations* ([1774] 1992), demanding instead a purely secular state: "The distance between altar and throne can never be too great. . . . The troubles of a society are most terrible when the disturbers [of social peace] can use the pretext of religion to mask their intentions." The apparent marriage of power and enlightened ideas was another such mask, a fact that made him keep his distance from both the "philosopher king" Frederick II of Prussia and from his chief apologist, Voltaire.

Diderot's collaboration with Guillaume Raynal in the *Histoire des deux Indes* led him to formulate a comprehensive critique of colonialism and

slavery. Nothing, he wrote, certainly no pretense of cultural superiority or missionary intent, could justify the subjugation of other peoples or the suppression of their cultural or moral practices—still less their enslavement and the pillage of their lands. If the only goal of morality is happiness, then nobody is in a position to judge the ultimate happiness of those living according to different customs, as Diderot argued in his *Supplement au voyage de Bougainville* ([1772] 1988).

While Diderot posits the existence of a universal morality, it can by definition not be embodied by any particular, local tradition, as their precepts are mutually contradictory. Therefore, no tradition can claim precedence over any other. Only the ability of any moral code to satisfy the common needs of human beings arising from their shared physical constitution can serve as a measuring rod for its merits.

Profoundly and uncompromisingly humanist in his principles and pluralist in his orientation, Diderot nevertheless remained skeptical about the possibility of a truly democratic state. This, he asserted, would demand a “concert of wills,” a common purpose, which could not be established in large societies, and a degree of education he believed to be unattainable for most citizens. “The Enlightenment,” he wrote, “ends at the suburbs.”

A similar consideration made Diderot immune to the utopianism elaborated by his friends Baron Paul Thierry d’Holbach and Claude Adrien Helvétius: Human beings are the product of their physical constitution as well as their education. This constitution, however, depends on bodily (including intellectual and emotional) characteristics changing randomly with every new individual—a conception anticipating our modern understanding of random mutation and DNA. Therefore, even if ideal laws would be possible there would always be people of different degrees of intelligence, morality, and ability. Politics can never do anything but work with the inconstant and imperfect conditions at hand, a continuous process of negotiation and adaptation, not a historical march toward an ideal state.

Durkheim, Émile

Émile Durkheim (1858–1917), a founder of sociology, never published a major work on politics but brought political issues in through concern with a crisis and the need for reform. He described the crisis in his first book, *The Division of Labour* ([1893] 1984), and summarized, in the preface to the second edition (1902), his long-developing vision of reform through new occupational groups. While this method is one way to approach Durkheim and politics, another is his concern with ritual, symbolism, and the sacred in *The Elementary Forms of Religious Life* ([1912] 1965). Although it is possible to see connections between these landscapes, it remains necessary to recognize differences between them. His essay “Individualism and the Intellectuals” ([1898] 1975) dismissed ritual and symbolism as superficial and invoked each person’s sacredness in calling for justice in social and economic relations. In a similar vein, his recently rediscovered article “The Politics of the Future” ([1917] 2009) returned, at the end of Durkheim’s life, to a related problem at the core of *The Division of Labour*.

Durkheim was a son of the rabbi of the small town of Épinal in eastern France and was registered in his birth certificate with the prenames David Émile, the first identifiably Jewish, but was known by the second within and outside his family. His career was typical of a pattern of assimilation and upward social-geographical mobility among males of his generation and background, making their way through the state educational system and migrating to the capital or other great cities. He went to Paris as a student in

1876, graduated from the prestigious École Normale Supérieure in 1882, then taught philosophy at various high schools but was already drawn to sociology. He obtained his first academic appointment in 1887 as a lecturer in social science at the University of Bordeaux. He became involved in the Dreyfus Affair in the 1890s to defend each person's equal status and rights as an individual. At the same time, along with a stream of publications, he was organizing the launch of a new journal, the *Année Sociologique*, and building up round him a group of young and talented scholars. He returned to Paris in 1902 with an appointment at the Sorbonne, where he was elected in 1913, in recognition of his achievements, to the first chair of sociology in France. With the outbreak of war in 1914, he threw himself into the national effort, lost his son in action in 1916, and tried to keep going through his work. He died, whether of grief, exhaustion, or cancer, while still in his fifties. Although above all committed to the intellectual life rather politics, he was a firm supporter of the Republic, was sympathetic with certain forms of socialism, and was the subject of anti-Semitic attacks.

The Politics of a Crisis

Durkheim's first book sets out in search of a modern social solidarity but ends up describing a crisis. Modern solidarity depends on conditions in which all can develop their unique qualities in line with their abilities and so depends on what he calls the spontaneous division of labor. This aspiration is blocked in modern everyday scenes of exploitation, injustice, and the inequalities of a class society, featuring a combination of what he calls the anomic and the constrained divisions of labor.

An underlying cause of an anomic, morally deregulated division of labor is the creation of social gulfs in which individuals are not merely divided by inequalities of class but are physically ghettoized and segregated in the alienation of a radical separateness. To overcome anomie and rebuild a moral code, society must overcome these gulfs and rebuild solidarity through webs of groups that link individuals with one another and with wider social life. Civil society's lack of an organization to tackle the crisis is part of the crisis itself. At the core of what for him involves a political malaise is what he describes, in *The Division of Labour's* new preface, as

the sociological monstrosity of a mass of atomized individuals and an authoritarian, overcentralized state.

Unlike Karl Marx, Durkheim saw no future withering away of the state but maintained, on the contrary, that everything pointed to its growing role. Hence, he was alarmed at a withering away of civil society and campaigned for what amounts to a form of guild socialism. This form of socialism, he thought, could renew active citizenship through a pluralist commonwealth that counterbalances the state with an independently powerful democratic organization of occupational groups. He defended an ethic of the person but criticized competing currents of individualism, including those connected with an authoritarian state and sordid commercialism, code, perhaps, for the economistic, interest-driven individualism of capitalism.

The preface to the second edition of *The Division of Labour* thus criticizes diverse modern forms of collectivism that reimprison individuals in community, a monolithic state, or a chauvinistic nationalism. His own alternative asserts an ethic of the person not as a mere apparition out of philosophical thin air but as a real being rooted in sociohistorical movements toward what in various texts he calls the human ideal and a human *patrie*. While envisaging the formation of new political societies such as a united Europe, he opposed dreams of world government. His more local versions of building the human ideal through reform was based on guild socialism in its building of webs of new groups. At base, Durkheim's ethic of the person is bound up with a set of abstract ideals encapsulated in the French Revolution as liberty, equality, fraternity—ideals, as emphasized in *The Division of Labour*, that are open to a multitude of disputes.

Social conflicts are best resolved, Durkheim argued, through the solidarity of citizens' attachment to a particular political society built on webs of authentic relationships. But this solidarity is inevitably crippled by class divisions that compromise human rights, despite lip service paid to them and to the human ideal. What is lacking is a genuinely democratic framework of collective argument. He envisioned new occupational groups kick-starting a process of reform by creating a forum for negotiating a way through disputes over justice in social and economic relations and for

working to translate key abstract ideals into a coherent and practical moral code.

The Politics of the Future

The Elemental Forms of Religious Life comes with an account of how the French Revolution's effervescent energies created a secular religion, complete with its own ritual and symbolism. But the conclusion comes with concern with the limitations of ritual and symbolism in a present-day crisis, and instead looks to a new moment of effervescence to regenerate social and moral life through an upsurge of idealism. Moreover, in a talk about his book in 1914, Durkheim concludes by noting fundamental social forces on the move, locates them among the working classes, and identifies them with aspirations to justice. In writing a few years later on the politics of the future, he reflects on the experiences of the war but above all in concern with an issue central to *The Division of Labour*'s problematic of a modern crisis.

In discussing how the old regime's already declining guilds were abolished without a search for an alternative, he sees the French Revolution as posing an issue taken up in the socialist movement, increasingly absorbing politics and brought to a head by the war. This issue is the need to recognize economic life's social character and achieve its proper social organization. The war swept aside individualistic economic dogmas and showed that industries run for private profit could be transformed into public services. But a basic impact of war's daily traumatic experiences was a renewed, intensified sense of the social, an awareness unlikely merely to fade away but rather pointing to a postwar politics dominated by the issue of how, rather than whether, to develop a social organization of the economy. The working out of such a development would be determined by a future politics, not by his or anyone's concocting blueprints of the good society. Nevertheless, Durkheim foresaw certain aspects of this development. An example is his argument, made in a lecture immediately after completing *The Division of Labour*'s manuscript and concluding the second edition's preface, about tackling present-day economic inequalities by developing forms of collective yet decentralized ownership and control of wealth through the new, reformist occupational groups.

It remains unclear whether Durkheim hoped to moralize capitalism or to go beyond it altogether. What is clear is that the uncertain process of economic and social reform would be worked out through democratic politics grappling with the fresh challenges that, he insisted in *The Division of Labour*, would always provide a field wide open to our efforts to build a better commonwealth.

Influences and Trajectories

Marcel Fournier (2012) provides a guide to the many personal as well as impersonal influences on Durkheim. Jean Terrier (2011) situates Durkheim's work within French debates since the eighteenth century over a social conceptualization of the political. Susan Stedman Jones (2001) brings out its roots in French nineteenth-century republican and socialist movements. Durkheim's vision was in a developing theoretical effort, based in practical political struggles, to anchor the freedom of individuals in a solidarity of collective life and in what Durkheim's left-wing philosophical hero, Charles Renouvier, called a society of persons. Part of the reason for Durkheim's hostility to Marxism was his attachment to republican and socialist ideals of a human *patrie* as evolved and continuing to evolve in France itself.

A history of the development of Durkheim's reputation would require many volumes. The view of Durkheim as a political conservative, widespread in the English-speaking world in the 1950s and 1960s, was killed off during a period of sustained critique by writers such as Anthony Giddens (1972) and Mike Gane (1992). In France, Durkheim's followers formed a network round his nephew and closest collaborator, Marcel Mauss, and for a while managed to hold the fort as the French school of sociology. This effort collapsed after World War II under the onslaught of rival forces such as Marxism, Weberianism, and American-style empiricism. But Durkheim had become sufficiently engrained in collective memory to continue as a diffuse general influence. There has also been a recent, more specific revival of interest in his thought, in competing claims over his republican legacy. These interests are discussed by Derek Robbins (2011) in an essay sketching out the political transformations of Durkheimianism in France from the 1900s to the present day. At the same time, such politically

engaged disputes have come with a growth of scholarly research, in particular studies, discoveries of lost manuscripts, and the current preparation of the first annotated critical edition of Durkheim's works.

Economics and Political Thought

In the late eighteenth century, the scientific methods of inquiry became the preferred means of studying the production, exchange, distribution, and consumption of goods and services, thus giving birth to the modern use of the term *economics*. These activities take place within a political framework and presuppose a political infrastructure. It is therefore not surprising that many if not most political theorists at some point turn their attention to these issues. Indeed, many of the seminal thinkers of modern political thought are also recognized among economists as laying the groundwork for their studies.

The close relationship between politics and economics has long been recognized; that they can be separated is a relatively new idea. To find Aristotle's treatment of topics that would today fall under the heading of economics, such as private property, the distribution of goods, currency, exchange, and wealth, one would have to turn to his political treatises, *The Nicomachean Ethics* and *The Politics*. Much of Aristotle's writing in this regard was in response to the communal ownership spoken of by Socrates in Plato's most famous political dialogue, *The Republic*, the subject of which is justice. That Aristotle and those influenced by him such as Thomas Aquinas should take an interest in economics should not surprise us insofar as these thinkers, much like modern thinkers, were concerned with the issue of justice. When is an exchange just? What is the most just form of distribution of goods and services? The typical name given to studies animated by these questions prior to the advent of modernity was *political*

economy. And those who studied it were typically moral and political philosophers.

With the Enlightenment came the compartmentalization of disciplines, and economics was among the first to partition itself off. That it is part of a larger whole, however, is often felt. It is difficult to consider any political theory serious if it leaves untouched the management of the economy. At the same time, economic theories can hardly avoid being political theories simultaneously because economics, like politics, is animated by the pursuit of a common good. A brief sketch of the history of modern economic theory is enough to see the close relationship it has with modern political thought.

Liberalism and the Laws of Nature

Economics as it is understood today is the product of the Enlightenment project to advance knowledge using the tools and methods of science. Enlightenment thinkers sought to uncover laws of nature that, once discovered, could be utilized to improve the conditions of human life. This desire applied to more than just the exterior world; rules of human behavior were also the subject of study. Thomas Hobbes, for instance, taught that an improved polity could be built upon the human passion of fear. Other thinkers disagreed with Hobbes's reliance on fear, but they agreed that a better understanding of the human passions could serve as the basis for new political and economic institutions.

In perhaps the most well-known Enlightenment treatise claiming to have discovered certain laws of nature as they apply to humans, John Locke claims that private property entails individuals' lives, liberties, and estates and that the purpose of government is to protect that property. By describing humans in terms of property, Locke's *Second Treatise of Government* argues that humans are motivated primarily by their self-interest not simply to avoid harm, but to make better the world in which they live. Through their labor they cultivate nature's raw materials, giving them ever-extending value.

Locke and other Enlightenment figures wrote at a time when nations formed their economic policies under the influence of mercantilism. The ideas that composed this theory were generally adhered to from the sixteenth century through most of the eighteenth century and were intended to help build and then protect the interests of European nation-states. A general assumption existed that the world's wealth was fixed and that nations could only increase their own share of it at the expense of others. Nations thus exercised extensive control over agriculture, manufacturing, and foreign trade. They also sought to expand upon their wealth through colonization outside of Europe, an activity that raised many ethical questions for politics and international law. In response to the heavy control exercised by nations under the mercantilist approach, Enlightenment thinkers emphasized the importance of individual liberty, thus giving rise to the set of ideas that have come to be known as liberalism.

As early as the mid-seventeenth century, William Petty, influenced by thinkers such as Francis Bacon and Hobbes, advocated the use of empirical methods and induction for studying money and other economic themes. And in 1755, Richard Cantillon published an essay that treated economics the same way Isaac Newton treated physics. The economy, he argued, operated by way of invisible laws that could be defined through empirical study. Cantillon emphasized the importance of the market and entrepreneurs.

Physiocracy, often regarded as the first school of modern economic theory, also took aim at mercantilist policies, particularly those of eighteenth-century France under Louis XIV's minister of finance, Jean Baptiste Colbert. Like Petty and Cantillon, physiocrats sought laws of nature that governed economic relations. Better to follow these unwritten laws, physiocrats argued, than oppose them with the man-made laws of mercantilism. In particular, they argued that national wealth should be measured by productive labor and not by the accumulation of precious metals or the balance of trade. Physiocrats are often noted for their emphasis on agriculture, which has a closer relationship to nature than manufacturing. The literal meaning of physiocracy is "rule of nature." All laws and regulations should be aimed at allowing individuals to pursue their interests insofar as doing so is the natural course of promoting the common

good. It is the physiocrats that coined the term *laissez-faire*, literally meaning to allow. In some ways, however, the physiocrats fell short of the full Enlightenment spirit. Though they praised individualism, they remained devoted to the monarchical regime. And their emphasis on agriculture ran counter to the culture of industrialization that was emerging in Europe in the eighteenth century.

The Rise of Capitalism

The first systematic economic treatise written in the full spirit of the Enlightenment was Adam Smith's widely influential *Inquiry into the Nature and Causes of the Wealth of Nations*. Some argue that what is revolutionary in Smith's economics is not what is new but what is dropped from the older Aristotelian approach, which takes its cues from a conception of man's final good. Smith is more concerned with the means rather than the ends of economic life, a concern that, in part, places his work within the Enlightenment tradition. Liberalism's defense of individual liberty found one of its most enduring champions in Smith, who reasoned that economic liberty, not central authority, is the best means of producing wealth. Smith thus laid the foundation for what we now call capitalism, generally defined as an economic system of private enterprise where development is spurred by the reinvestment of profits.

Smith's ideas are similar to those of his friend David Hume. Both believed a new, empirical understanding of economics was a necessary component of political change. Though Hume never wrote a treatise on the subject, several of his essays prescribe economic policies designed to alleviate the human condition and promote human liberty. What is more, Hume recognized that the promotion of economic liberty would have implications for political liberty—the two would reinforce one another. Hume thus bears some resemblance to the physiocrats, but rather than seek laws of economics based upon the character of the natural world, Hume focused on the nature of man, particularly selfish inclinations.

Like Hume's, Smith's economic theory is founded upon mankind's selfish inclinations. Importantly, *The Wealth of Nations* was not Smith's first major work; his *The Theory of Moral Sentiments*, first published in 1759, was also

very successful. How the two works fit together is the source of some controversy among scholars, but the selfish nature of humans is a key element of both. The first sentence of that earlier work seems to purposely call to mind Hobbes and draw a distinction: “How selfish soever man may be supposed, there are evidently some principles in his nature, which interest him in the fortune of others, and render their happiness necessary to him. . . .” In contrast to Hobbes and Locke, Smith acknowledges that humans, through their inclination to sympathize, are social animals. But in making this claim, Smith is certainly not looking back to Aristotle, who referred to humans as political animals. Indeed, Smith remains very much a modern in his concern for material well-being.

Likewise, *The Wealth of Nations* famously argues that the pursuit of self-interest is what makes for a strong economy in a free market that directs selfish inclinations. General laws that attempt to regulate the economy do not yield the highest potential outcome. Better to let the invisible hand of the market guide humans’ pursuit of their self-interest. People will do what they believe is best for themselves anyway; the statesman’s task is to create an institutional environment that will allow this natural tendency to work for rather than against the common good. The themes of liberalism found their fullest economic expression here: allow individuals to advance their own good and they will not only benefit themselves, but also each other in turn. In this scheme, reason is to serve and not control the passions. Smith was not, however, the devotee of pure laissez-faire capitalism as he is sometimes erroneously portrayed. In elaborating his theory and, in particular, showing the benefits of a division of labor, Smith recognizes the likelihood of a large laboring class with monotonous and tedious tasks. Seeing no theoretical solution, Smith forewarned governments that policies will have to be adopted to ease the conditions of this working class. Unlike later political thinkers, Smith did not subscribe to the idea that human nature could be changed in order to avoid the undesirable results of nature’s invisible hand.

Classical Economics

The legacy of Smith’s economic theory and its political consequences can hardly be understated. The century following the publication of *The Wealth*

of Nations was dominated by the elaboration of its themes, particularly that of liberty, and is known as the classical period of economic thought. While most of the leading thinkers of this period did little to question the philosophic and political thought at the foundation of Smith's work, many helped to clarify the latent political ideas at work in Smith's teaching, the work of Jean-Baptiste Say being a good example.

In other cases, however, disagreements arose. For instance, Jeremy Bentham's 1789 *Introduction to the Principles of Morals and Legislation* was written in the same Enlightenment spirit as Smith's *Wealth of Nations*, but prescribed a more active government. Bentham agreed with Smith's emphasis on individual self-interest as the basis for economic growth but was not convinced that an invisible hand could harmonize private interest into a larger public good. Smith's reliance on nature did little to explain criminal actions so evidently against the public good. Instead, Bentham taught that the business of the legislator was to deliberately intervene so as to bring about a union between private and public goods. He referred to his union as utility, and he believed it could be quantified and therefore measured formulaically. Once the mathematics of utilitarianism was known, governments could better regulate the economy so as to maximize utility. Where Smith had praised liberty, Bentham held up equality insofar as utility was to be measured by the sum of individual interests regardless of class.

Differences aside, both Smith and Bentham were animated by the spirit of optimism so prevalent in Enlightenment thinking, but this optimism could last only so long. The project of social progress through reason must have natural limits, and failure to observe those limits could end up creating multiple new problems. Such was the thinking of Thomas Malthus who predicted that the world's population would soon outpace the food supply. Deliberate effort on the part of government to alleviate the plight of the poor would only exacerbate this reality by increasing the price of food without a similar increase in volume. It would also encourage those who could hardly afford it to procreate. Nature has provided means of keeping the population in check, and these checks should be allowed to work their course. Malthus's ideas had an important influence on Charles Darwin's study of biology. Social Darwinism thus has a precursor in Malthus's economic thought.

Classical economics' belief in progress would be renewed in the thought of John Stuart Mill. The generation immediately preceding Mill, including Bentham, David Ricardo, and Mill's father James, engaged in economic analysis in the classical mode as a way of addressing policy issues of the day. In doing so, they contributed to economic thought by way of elaboration of a given theory. Unlike Smith, they were not philosophically minded. This, however, cannot be said of the younger Mill whose various writings, including those on economics, were animated by deeper concerns. He famously held that no economic question can be decided on the basis of economic criteria alone. To do so is to ignore the noneconomic aspects of human life. This approach has much to do with Mill's complexity. His brand of utilitarianism refused to count all pleasures as equal, unlike the Benthamite philosophy he was raised on. He is in general a defender of the free market, yet he allows exceptions to the laissez-faire doctrine for the common good. He is a strong advocate for individual liberty, but not at the expense of human equality. And though he saw government as generally inefficient, he was open to the possibility of socialism. Economic policy could not be decided on the basis of a single formula; rather, the fuller picture must be seen including the possibility of future progress in terms of both individual development and the common good.

Historicism and Scientific Socialism

Karl Marx was a contemporary of Mill's and even spent a large portion of his life in London. But Marx brought to his study of classical economics a heavy dose of historicism from his homeland of Germany. Historicism was not limited to Germany, but it found its most fertile ground there in the nineteenth century. Rather than seeking laws of nature, as was the common Enlightenment practice, historicists answered political and economic questions in terms of a process of rationalization over the course of time. This process led to an embrace of the state as the product of history. Liberty is realized by the individual not in contradiction to the state, but in alliance with it. Those who sought universal laws of nature as guides for political and economic activity did so in vain; human behavior was the product of the historical contingencies of a given political association. German historicism reached its peak in the work of Georg Wilhelm Friedrich Hegel, who understood history in terms of conflicting *Geists*—ideas or a general

spirit among a people—continuously evolving and made known through political associations such as the state.

What made historicism a contagious theory was the growing dissatisfaction of economic disparities associated with classical economic thought, exacerbated by the industrial revolution. Whereas classical economists tended to argue against policies aimed at alleviating the condition of the poor and working classes, historicists promoted better conditions. Though historicists were not without socialist allies, their scholarly case lacked the sense of objectivity that classical economists enjoyed due to the quantitative evidence the latter could produce.

In Marx, socialists found a historicist argument with a scientific appearance. With the help of Friedrich Engels, Marx provided an interpretation of history designed to challenge the classical economics' reliance on reason to discover economic laws, and he intended to do so on classical economists' own turf. For Marx, the mainsprings of historical change were economic; more specifically, history is moved by the means of production necessary for satisfying the material requirements of human life. His argument resembles that of Hegel, but rather than understanding history as the collisions, merges, and triumphs of Geists, Marx sees it as struggles between economic classes. Politics was the result of a dominant class subjugating the others with laws and included fictions designed to encourage submission. He thus calls religion and the morality derived from it the opium of the masses intended to maintain existing economic conditions.

Like Hegel, Marx predicted a final, rational end of history, though he of course foresaw a different end than his German predecessor. Where Hegel saw the state as the rational end, Marx prophesied that a classless society was coming. Much of his work called upon the working class to unite and help usher in the final stage of history. This is most evident in the *Communist Manifesto*, a relatively short pamphlet cowritten with Engels. Here Marx lays out his production-based theory of history and describes the present basis of political society as a clash between the oppressed proletariat class who labors under the exploitive bourgeois class and the bourgeoisie. The latter own the means of production, the capital, but it is the

former that provides the labor, and while it is labor that gives value to the product, it is only those with capital who profit. This arrangement, Marx says, has achieved massive amounts of production and has even subjected nature's powers to mankind's purposes. Ironically, the success of the bourgeoisie threatens to undermine their project insofar as it requires equipping the proletariat with revolutionary tools. What is more, it has primed the world for revolution through its incessant drive for new markets, which has made the world more cosmopolitan. The revolution of the proletariat, when it comes, will be global, ending in a classless world where finally the means of production are held in common.

The more scientific backing for Marx's theory comes later in his multivolume work *Das Kapital*, subtitled *A Critique of Political Economy*. Here Marx, again with the help of Engels, makes his case for his labor theory of value, his answer to the age-old question of the justice of exchange. Since Aristotle, thinkers have understood a good's value relative to the number of other goods it can trade for. Money of course facilitates this exchange. Marx believed that a good's true value was based upon the labor that went into producing it. Workers were thus exploited when employers compensated them for only a portion of their labor. This theory quickly grows complicated when one considers the differences between individual productivity and skills. Many have argued that Marx's labor theory of value allows him to chastise all income, even that earned through means other than labor, as exploitive. But this is simply to note that his economic writing cannot be separated from his political thought; indeed, it serves as its foundation.

Economics and Political Thought Today

Smith's theory of the invisible hand and Marx's economic historicism each have been enormously influential since the original publication of their respective books. No doubt their influences have pushed in different directions. Contemporary political thinkers find themselves facing the same question as Aristotle in *The Politics*: should property—in modern terms the means of production—be held privately or in common. The question is fundamental because of its relation to justice and the common good and

therefore contains within it implications for people's way of life under a political regime.

In the twentieth century, several thinkers and schools have emerged animated by this fundamental question. Many of their contributions have been interwoven with political theory and have had an influence on public policies. Among the most important is John Maynard Keynes, who famously taught that governments could bolster and grow their economies by using taxation and public expenditures. By taking an active part in influencing the aggregate demand of the economy, governments could secure and even raise wages without causing unemployment. Although a defense of capitalism against communism, this theory was a significant break from the classical notion of an invisible hand. Ironically, defense of classical economics contra the British Keynes was initially centered in Austria. Notable students of the Austrian school, such as Joseph Schumpeter and Friedrich Hayek, disagreed with the economic thought that encouraged government intervention. Rather, they favored the classical approach of understanding the signs of the market and allowing individuals to act upon those signals. This approach was more conducive to protecting human liberty. A similar critique has been made against Keynes in America by Milton Friedman, leader of the so-called Chicago school of economics.

Keynes and his critics represent competing sides of a fundamental political disagreement that is as old as Plato and Aristotle. As different as the work of contemporary economists appears from political inquiry, they consistently provide evidence that production, exchange, distribution, and consumption are issues bound up with justice and the common good. We therefore have good reason to suspect that economics will continue to be a relevant and even indispensable issue for political theorists.

Education and Political Thought

The relation between education and political thought has a long history, going back to Plato and Aristotle. More recently, as B. S. Turner (2006) has noted, early French sociological thinking regarding the development of a secular modernist society focused on the importance of education, as in the work of Émile Durkheim (1858–1917), who lectured in both pedagogy and sociology. Much later, Karl Mannheim (1893–1947) would render education central to his view of social reconstruction and democratic planning. Many would argue that education is not a neutral enterprise. This conception, though generally associated with the work of Paulo Freire (1921–97) and people he inspired, has been the mantra of several other movements.

Over the last thirty years we have been exposed to thinking about education just as strongly connected with the market ideology, commonly referred to as neoliberal (e.g., Chester Finn Jr., b. 1944). Education is seen as an object of private consumption rather than as a public good, with responsibility for learning being placed on the individual. This view contrasts with notions of education as a democratic public good, associated with a variety of thinkers, notably John Dewey (1859–1952) in his conception of a democratic education for the creation of a democratic society. Dewey's notion, combined with insights from critical theory and other sources, has more recently been taken up by Henry A. Giroux (b. 1943) regarding the need to defend public spaces against the onslaught of neoliberal commodification. Giroux (2005) broadened the notion of education to include several sites of

public pedagogy, ranging from schools to cinemas and youth entertainment areas, as well as the consumer culture and military ideology. He analyzes the devastating effects and terror of neoliberal policies and argues for universities, schools, and other learning agencies to serve as democratic public spheres. Michael Apple (b. 1942) argues for the democratization of the curriculum, which he presents as a site of contestation mirroring other sites of struggle such as the state and the domain of textbook publishing. In *Official Knowledge* (1993), Apple details the economic, political, and ideological processes that enable specific groups' knowledge to become official while other groups' knowledge is popular. Over the past two decades, he has critically examined the social movements that internationally exercise leadership in educational reform. He has also analyzed progressive reforms that can provide models for critically democratic alternatives. In her 2011 book, *A Dissident Voice*, Antonia Darder (b. 1952) has engaged with issues of cultural democracy and with notions of culture and power concerning conditions of schooling in disenfranchised and racialized communities.

Most of these writers are exponents of critical pedagogy. One major exponent, Peter McLaren (b. 1948), defines critical pedagogy in his 1994 work as being “fundamentally concerned with the centrality of politics and power in our understanding of” education and learning (167). Critical pedagogy is very much inspired by Freire, although there are many others who stress the political nature of education, including Lorenzo Milani (1923–67) and his students at Barbiana (students pushed out of the public school system). Their *Letter to a Teacher* (Borg, Cardona, and Caruana 2009) is a classic concerning the relationship between social class and educational achievement. Among other things, this narrative emphasizes the collective dimension of teaching and learning and the class basis of social selection as manifest in selective public and private systems. This work anticipates writings associated with critical pedagogy and the new sociology of education, the latter born of a series of writings (Young 1971) that signaled an approach indicating the ideological basis and class biases of schooling. This demonstration of the affinities between the culture of middle-class homes and that of the school, and schools' traditional rupture with working- and peasant-class cultures, resonate with Pierre Bourdieu's (1930–2002) writings concerning the school's cultural arbitrary and the

issues of habitus, as well as cultural and social capital as determinants of educational success or failure.

This kind of critique would normally be found in Marxist political thought, though Milani and Bourdieu were not Marxist. Neither was Basil Bernstein (1924–2000), who forged strong connections between pedagogical approaches (classification and framing of knowledge), linguistic codes, and social-class locations. Paula Allman (1944–2011) was one educational writer who did much to engage directly with Marx's own writing regarding ideology and the production of consciousness, dialectical thinking, education's role within the base-superstructure relation, and education's role in the reproduction of the social conditions enabling the ruling class to retain and consolidate power. Marxist thinking on education is featured in the work of the structuralist philosophers Louis Althusser (1918–90) and Nicos Poulantzas (1936–79), and it explained the socially reproductive function of education in capitalist society, for Christian Baudelot (b. 1938) and Roger Establet (b. 1938) in France and Samuel Bowles (b. 1939) and Herbert Gintis (b. 1940) in the United States. Key topics include the schools' inculcation of the bourgeois ideology and the correspondence between social relations in different school tracks and/or streams and in the different types of work to which the tracks are likely to lead. Marxism has also informed scholars engaged in ethnographic work regarding how students resist the dominant culture in schools and thereby secure working-class jobs (Corrigan 1979; Willis 1977)

One Marxist writer who wielded much influence on the educational field is Antonio Gramsci (1891–1937). His concepts of hegemony, the intellectuals' roles, the factory-council theory, and the integral state have become central concepts in discussions of the relationship between education and power. Gramsci views education in its broadest context as incorporating the elements of the hegemonic apparatus. Gramsci's pedagogical philosophy is the pedagogy of praxis, entailed by his philosophy of praxis. Other issues concern the role of education in the integral state and the heuristic value of analyzing the distinction between political and civil societies

A extensive debate has ensued concerning the connection between education and the state. Roger Dale (b. 1940) analyses the complex relationships occurring between capitalism, state, and education. Drawing on Claus Offe, he analyses the process whereby education plays two key roles in the capitalist political economy: first, in legitimating class society by teaching that inequality results from our different abilities, and second, by providing training and human capital for national and global economic ends. Dale argues that the ways social tensions are felt and addressed through education shape citizens' understanding and experience of the world. Other authors such as M. Carnoy and H. Levin (1985) and A. Green (1990) have also analyzed education in the context of the state's legitimation and accumulation functions and its varying formations.

The nonneutral, political quality of education lies at the core of a long tradition of educational provision, beginning in the early twentieth century, known as independent working-class education (IWCE), manifested, for example, in the work of the Plebs League and the labor colleges in Britain and Australia. This movement represented an attempt at a break with bourgeois culture by means of Marxian-inspired classes and schools, workmen's colleges, alternative libraries, and sporting events (Waugh 2009).

The critique of capitalist education and more recently, neoliberal education has come from various quarters. Feminist writings have served to expose the contribution that education makes to the consolidation of patriarchy as well as its potential to challenge patriarchy both within and outside formal institutional settings. Sara Delamont (b. 1947), for instance, has argued in *Feminist Sociology* (2003) that both sexes are diminished by institutional sexism in all sectors of the educational system, reflected equally in the dearth of women in science and engineering and the lack of men training as infant teachers or nurses. Jane Thompson (b. 1946) has applied a feminist critique to the curriculum and practice of women's education and adult education, focusing on women's access to education, the political aspects of women's lived experiences, and the changing conditions of women in global capitalism (Thompson 2000). She has exemplified the linking of women's activism to both educational change and to wider social and political movements concerned with fighting inequalities. Similarly,

Kathleen Lynch (b. 1951) contributed to feminist thinking on politics and education through her work on the intersectionalities of injustice, examining ways by which gendered problems of recognition are interwoven with issues of redistribution and representation. She has also highlighted the importance of relationality and emotions for understanding the dynamics of injustice in education and has developed the concept of affective equality to explain how carelessness is a key equality problem for society and for educators. Angela Miles's (b. 1946) main theoretical contribution to educational politics is the concept of integrative feminisms and multicentred (as opposed to decentred) social movements (Miles 1996). She draws on Adrienne Rich's (1929–2012) integrative feminist perspective on education that recognizes the specificity of women's history, interests, and value. Like Rich, Miles stresses the importance of women's being able to recognize and name the world very differently from the way men have done—rather than simply having equal access to male education.

Of particular importance is the work of Mary Belenky and colleagues (1986), who focused on how women learn and what is distinctive about their learning, drawing their insights from responses to questions posed to 135 female interviewees. Despite some average differences between men and women, the five levels of increasingly complex learning uncovered by these women authors from their female students apply to and offer insights for men as well. In Italy, Anna Maria Piussi's (b. 1944) pedagogy transcends an exclusive paradigm of victimization of and discrimination against women by valuing, especially through education, women's difference and differences in general to help individual women gain awareness of themselves and to discover their voices as woman engaged in relationships with others.

The author bell hooks (b. 1952) brings an African American perspective into the debate on women and education by foregrounding the issue of race and ethnicity in this context. In addition to hooks, a whole body of work, notably articles in the journal *Race, Ethnicity and Education*, addresses such concerns. A towering figure is the African American writer and sociologist W. E. B. Du Bois (1868–1963), who wrote extensively on the empowerment of black students by means of an education that enables them to see themselves through their own eyes rather than through the white

perspectives provided by traditional education. In *The Souls of Black Folk* ([1903] 1961), Du Bois famously rejected as demeaning the willingness of fellow black educator Booker T. Washington to have African American students restricted to pre-collegiate education.

More recently, the writings of George Sefa Dei (b. 1954) formulate an integrative antiracist education, encompassing race, class, gender, sexuality, and disability interactions through a race-centric lens. Dei (1998) examines black youth disengagement from school as what he calls a push out problem, developing the concept of Africentric schooling as a countervision to conventional white-centric education and promoting anticolonial thinking in education and the importance of indigenous knowledge.

Closely related to the ethnicity-education dynamic is thought associated with postcolonial and decolonizing studies in education. The term *postcolonialism* refers to an all-embracing phenomenon of struggle against processes of domination that had their origin in European colonization. These processes extend beyond the period of direct colonization to take on new forms, notably those of neocolonialism, dependency, and the intensification of globalization. As noted in Wa Thiong'O Ngugi (1981), as a site of struggle, education has constituted a key vehicle for the colonization of the mind, and it can become a powerful vehicle for its decolonization.

There is also a body of literature on education connected with the disability movement. It eschews the medical-deficit model and adopts the social-constructivist approach emphasizing alternative ways of defining a problematical situation. Articles in such outlets as the journal *Disability & Society* address issues of theory, and especially of policy regarding disabilities. Writers such as Susan Peters (b. 1947) in the United States have drawn on Freire to explore empowering pedagogical insights in this context. The literature exposes forms of disabling environments and education and explores possibilities for an enabling education for all. In this view, the institutional and cultural barriers are regarded as disabling, difference is valued, and the unique strengths of individuals are emphasized. Contributors such as Mike Oliver (1990) also shift the focus from individual deficits to disabling environments when reversing a series of

conventional deficit questions regarding what is awry with the relationship between the individual and the environment. As age is often regarded as a disabling conditioning, there is a growing body of theoretical and empirical work, including that of youth activists themselves. For example, in their 2002 work *Take Action: A Guide to Active Citizenship*, Craig and Marc Kielburger have called into question age-based restrictions on human rights and voice.

The theme of inclusion is not confined to relations among humans but extends to human-earth relations, often in the context of ecopedagogy. This holistic approach to pedagogy conceives of people as primarily relational beings acting in communion not only with other humans, but also with all other beings within the cosmos. The work of Edmund O'Sullivan (b. 1938), drawing on Thomas Berry, is representative (see O'Sullivan 1999). The work of American Indian writer and activist Winona LaDuke also exemplifies this approach; see, for example, her book *All Our Relations: Native Struggles for Land and Life* (1999).

Finally, a large body of work deals with policy making in education, a good example being the writing of Stephen J. Ball (b. 1950). Ball's major contribution has been the development of a method of analysis—the policy cycle—that combines Foucauldian theory and ethnographic methods to offer a set of starting points for theorizing and researching educational policy processes. Ball's earlier work focused on the micropolitics of the school, using political theory to develop a conflict model of school organization. This perspective overlaps with case studies of youth and student participation in policy making as reported in such outlets as the e-journal *Children, Youth and Environments*.

Eighteenth-Century Political Thought

Political thought in the eighteenth century covered a broad spectrum ranging from advocates of revolution and democracy on the left, to proponents of moderate reform and limited constitutional government in the center, to defenders of throne and altar and counterrevolution on the right. Historians sometimes speak of the long eighteenth century as stretching from the Glorious Revolution in Britain (1688–90) to the French Revolution of 1789 and its aftermath, ending with the final defeat of Napoleon in 1815. There is some merit in this approach as far as the political thought of the century is concerned since it conveniently encompasses three major revolutions, in Britain (1688), the United States (1776), and France (1789). Also, it begins with a crucially important and influential political work, John Locke's *Two Treatises of Government*, which was published anonymously in 1689, although, as Peter Laslett has shown, almost certainly written in its near entirety a decade earlier. In it, Locke sets out his systematic justification for a limited form of constitutional government based on the rights of individuals and the protection of private property, a position that was to prove enormously popular in the eighteenth century, particularly after 1750. Locke's rejection of political despotism in favor of a contractualist view of political society that included a right of citizens to rebel if the terms of the contract were breached proved to be very attractive to many of the American founding fathers and the French philosophes, although the actual extent of his influence on them remains a matter of some debate among scholars of the

period. Locke also defended religious toleration in his *A Letter Concerning Toleration* ([1689] 2010) and empiricism in his *Essay Concerning Human Understanding* ([1690] 1959), both of which were very widely read and admired in the eighteenth century. The latter argues against the traditional concepts of innate ideas and original sin—and in apparent contradiction of his assumptions in his treatises on government—in favor of the mind conceived of as a blank slate, according to which knowledge is acquired by means of sensory perceptions. A Puritan by birth and brought up as a Christian, Locke nonetheless claimed that the state should tolerate a range of religious beliefs, a position that was highly congenial to the mainstream Enlightenment in Europe and the United States, which was averse to religious dogmatism and clerical authority. Although there were some atheists among the philosophes, such as Julien Offrey de La Mettrie, the Baron d'Holbach, and Denis Diderot, most were deists like Jean le Rond d'Alembert and François-Marie Arouet Voltaire who attacked established religious institutions and beliefs in favor of a minimalistic natural religion. This basic outlook was echoed by one of the leading representatives of the German Enlightenment, Gotthold Lessing, in his influential play *Nathan the Wise* ([1779] 2003), a defense of religious tolerance and pluralism.

The Enlightenment and the French Revolution

Although traditional religious and political beliefs by no means vanished in the wake of Locke, radical new ideas arose in the eighteenth century to challenge them, and these in turn provoked new defenses of traditional views. The Enlightenment was a broad movement of reform that swept through Europe and the United States in the eighteenth century challenging many of the basic ideas and practices of the religious and political establishments of the ancien régime. The scientific method of Isaac Newton and Francis Bacon was taken by the Enlightenment's proponents as the model for the systematic and reliable acquisition of knowledge in contrast to the obscurity of traditional metaphysics and orthodox religious beliefs, which science had disproved or displaced in the eyes of many. Faith in natural science as the best means for improving human well-being was very widespread during the eighteenth-century Enlightenment. Traditional beliefs and practices that failed to meet this standard ought to be discarded, according to the philosophes.

One of the best overall expressions of this outlook is d'Alembert's *Preliminary Discourse to the Encyclopedia of Diderot*, published between 1751 and 1772 (1963). The *Encyclopédie*, coedited with Diderot, was an ambitious compendium of knowledge published in France, comprising twenty-eight volumes, with 71,818 articles and 3,129 illustrations, including contributions by many of the leading philosophes of the day such as Voltaire, Jean-Jacques Rousseau, the Baron de Montesquieu, Anne-Robert-Jacques Turgot, and the Baron d'Holbach. This controversial and influential project was deliberately subversive of many traditional religious and political beliefs, eventually leading to its official suppression in 1759. In his *Preliminary Discourse*, d'Alembert outlines a naturalistic and secular method for organizing the vast amount of knowledge that he and Diderot had assembled, which he divided into three basic categories: memory, reason, and imagination. He also paid tribute to important innovators such as René Descartes, Newton, Bacon, and Locke in the progressive search for a new methodology for acquiring knowledge that he hoped would give mankind the power to independently shape and direct its own destiny.

There was little consensus among the Enlightenment's advocates on the ideal form of government. Locke's *Second Treatise* favored a mixed state combining a popular assembly that made laws with a limited constitutional monarchy that executed them. The German philosopher Immanuel Kant also favored a mixed form of government that was liberal and republican but not strictly democratic (in the sense of the direct democracy favored by Rousseau) since he believed that the latter posed a threat to individual liberty. Voltaire and d'Alembert spoke for the majority of the philosophes in France when they defended enlightened despotism as the most effective means to elevate the masses and promote human progress. In the United States, Thomas Paine attacked both of these views in his best-selling pamphlet *Common Sense* ([1776] 2012), which argues for a republican form of government independent of Britain. The democrat Rousseau put his faith in the people in his book *The Social Contract* ([1762] 1939), which was unpopular with most of his fellow philosophes and was banned for its subversive defense of the sovereignty of the general will and its perceived political attack on Christianity. However, it was both widely read and enormously influential among the generation of radicals who dominated politics during the French Revolution. For example, Maximilien

Robespierre was inspired by Rousseau's case for republicanism and popular sovereignty, a form of which he sought to implement in France (with disastrous results) despite Rousseau's clear assertion in *The Social Contract* that it applied only to small city-states. Unlike Rousseau, Paine lived to see the French Revolution, which he supported in his pamphlet *Rights of Man* ([1791–92] 2012) and as a member of the French National Convention. He was regarded as a supporter of the moderate Girondist faction of revolutionaries in the Convention, including the Marquis de Condorcet, one of the only philosophes who lived until the French Revolution. Both Paine and Condorcet were arrested and imprisoned in Paris in 1794 when the radical Jacobins, led by Robespierre, ruled France. Paine was released, unlike Condorcet, who wrote the most optimistic statement of the Enlightenment belief in progress, *Sketch for a Historical Picture of the Progress of the Human Mind* ([1795] 1993), just before he died in prison awaiting execution.

One of the leading theorists of the French Revolution was the Abbé Emmanuel Sieyès, who as a student at the Sorbonne had been influenced by Locke and the *Encyclopédistes*. He became famous as the author of an important and influential pamphlet published on the eve of the Revolution in 1789, titled “What Is the Third Estate?” Of the three traditional estates of ancien régime France (the clergy, the aristocracy, and the people), Sieyès argued that the third was the complete nation and alone should be sovereign. He was elected to the Estates-General as a deputy and played a major part in transforming it into the National Assembly of France in June 1789. He also helped to draft the Declaration of the Rights of Man and Citizen, embodying many of the most progressive political ideas of the eighteenth century, such as popular sovereignty, individual rights, and civic equality. The Declaration excluded women from the rights of citizenship (a view Sieyès shared), which prompted Olympe de Gouges to publish a Declaration of the Rights of Woman and the Female Citizen in 1791. In it, she asserts that the Revolution “will only take effect when all women become fully aware of their deplorable condition, and of the rights they have lost in society.” Like Paine and Condorcet, she was sympathetic to the Girondists and was executed during the Reign of Terror in 1793 for attacking Robespierre. Despite his support for the Girondists and against the odds, Sieyès narrowly escaped the guillotine and lived until 1836.

The Enlightenment was tainted by the violent excesses of the French Revolution, which many counterrevolutionary writers blamed on the steady corrosion of social and political order under the critical gaze of reason in the decades before 1789. An early example of this genre is *Reflections on the Revolution in France* by the Anglo-Irish statesman and writer Edmund Burke. This best-selling and highly influential attack on the French Revolution was published in 1790 (1987), well before the Jacobins came to power. Burke was a Whig politician who supported the Glorious Revolution of 1688 and was sympathetic to the claims of the American colonists against Britain but who recoiled against what he saw as a new, extreme form of revolution unleashed in France and directly inspired by writers such as Voltaire, Rousseau, and Turgot. Paine's *Rights of Man* and Mary Wollstonecraft's *A Vindication of the Rights of Men* ([1792] 1995) were both written as direct refutations of Burke's *Reflections on the Revolution in France*. They defended republicanism, reason, and religious toleration against Burke's case for piecemeal political reform, constitutional monarchy, hereditary aristocracy, and the indispensability of custom and tradition to the maintenance of social order and good government. Wollstonecraft also wrote *A Vindication of the Rights of Woman* ([1792] 1995), a pioneering work of feminist thought that attacked the traditional institution of marriage and argued that women ought to have the same rights and opportunities as men. Her *Rights of Woman* has been as important to the history of feminism as Burke's *Reflections* has been to the history of conservatism.

In France the Jesuit priest Augustin Barruel read and admired Burke's *Reflections*. He took its arguments even further in his *Memoirs Illustrating the History of Jacobinism*, which were published in 1797. This lengthy best seller elaborates the case that the French Revolution was a secret conspiracy planned by the philosophes and executed by the Jacobins and the Bavarian Illuminati to overthrow

Christianity and monarchy in Europe. Burke read Barruel's *Memoirs Illustrating the History of Jacobinism* shortly before he died and was much impressed with it. A less influential and less conspiratorial attack on the principles of both the Enlightenment and the French Revolution appeared in Joseph de Maistre's *Considerations on France* ([1796] 1994), which offers

a providential argument that the violence of the Revolution was divine punishment for the sins of the Enlightenment.

Debates in the Emerging United States

In the United States, the American Revolution also spawned heated debates about the nature of politics and the principles of good government. In 1787 to 1788, a long series of influential political essays was pseudonymously published defending the American Revolution and endorsing the ratification of the proposed U.S. Constitution. The authors of these *Federalist Papers*—Alexander Hamilton, John Jay, and above all, James Madison—drew heavily on Locke’s *Second Treatise*, as well on Montesquieu’s *The Spirit of the Laws* ([1748] 1989) and other eighteenth-century works by leading writers of the Scottish Enlightenment such as David Hume, to set out a case for a single, republican government for the United States with a president, based on representative democratic principles within a federal state, and involving a system of checks and balances designed to prevent political tyranny. They were opposed by the Anti-Federalists, who believed that the proposed Constitution risked creating a centralized form of disguised monarchy that threatened the economic and political diversity of the states that made it up. Beginning in the 1980s, scholars such as Donald Grinde and Bruce Johansen (1991) have marshaled evidence suggesting that another body of eighteenth-century political thought and practice—that of Native American confederacies such as the Iroquois—significantly shaped the political thought and practice of the U.S. Founders.

Empire and Political Thought

Empire means many different things and has been used in a number of ways in the long history of the term since the time of Roman imperium. In this entry, *empire* is used with the meaning it acquired as of the eighteenth century, to denote the conquest and rule of foreign lands, encompassing noncontiguous territories often far away from the imperial metropolis. The focus here will be on diverse responses to imperial expansion and rule by political thinkers from the late eighteenth to the early twentieth century. An earlier literature that had dealt with commenting on, justifying, or criticising imperial expansion in previous centuries, starting from that of Spain in the New World, cannot be discussed here (see Pagden 1995). Because, during the period focused upon, the greatest imperial formation was the British Empire, most of the political thought on empire and imperialism was produced by thinkers in the English-speaking world, though some important reflections came from elsewhere as well, as France, Holland, Belgium, Italy, Russia, the United States, Japan, and other countries conquered territories to augment their power. This entry focuses particularly on the insights and findings of scholarship published in the last decade or so.

Recent historiographical work has shown that there were important thinkers and currents of critique of imperial expansion even during the era that was usually seen as the apogee of Eurocentric universalist smugness. Sankar Muthu's major study of the subtle and powerful anti-imperialist writings of eighteenth-century thinkers such as Denis Diderot, Immanuel Kant, and Johann Gottfried Herder has enriched our understanding of Enlightenment

thought on human diversity significantly. Such thinkers questioned empire-building not only in terms of its impracticality or costliness to the metropolitan country, but also in terms of its unjustness. According to Muthu, these thinkers combined commitments to universal moral principles applicable to all people and societies with a belief in the existence of distinct and incommensurable ways of life and cultures that needed to be respected and preserved.

Another major historiographical contribution of the last decade came with Jennifer Pitts's work. She studied the attitudes towards empire of some major political thinkers in late eighteenth- and early nineteenth-century Britain and France and compared them with the attitudes of two iconic mid-nineteenth-century liberal thinkers in the two countries, John Stuart Mill and Alexis de Tocqueville. Many significant differences between thinkers within each of these two groups notwithstanding, Pitts identifies a "turn to empire" in British and French liberalism by the mid-nineteenth century. While the earlier thinkers she discusses—Adam Smith, Edmund Burke, Jeremy Bentham, and Benjamin Constant—all displayed varying degrees of mistrust of imperialism and remarkable degrees of open-mindedness and respect for different cultures, according to Pitts, their liberal successors had, between the 1830s and the 1850s, made a *volte-face* and embraced empire and imperialism in ways that were unknown among the earlier group of thinkers. Though others (e.g., Mehta 1999) have seen this trend as inherent in the liberalism of the period, Pitts argues that during the mid-nineteenth century, the particular thinkers who emerged as iconic figures of liberalism—Mill and Tocqueville—embraced empire and imperialism for their different complex reasons.

One of the eighteenth-century thinkers praised (by both Pitts and many other students of empire) for his critical stance toward the British Empire was Adam Smith. Smith emerges as having displayed remarkable respect for cultural difference, and a refusal to dismiss different or less advanced societies as irrational. Smith instead accounted for the ways of living and customs of such less advanced societies as rational reactions to their material circumstances. He thus offered functional explanations of their customs and ways, rather than attributing these latter and their potential

defects to the mental state or condition of the peoples concerned (Pitts 2005, pp. 25–58).

Adam Smith has attracted much attention for his writings on the British Empire both in the *Wealth of Nations* of 1776 and in a secret memorandum on the options open to Britain in the midst of the American War of Independence in 1778. He famously wrote in the former work that Britain did not really possess an empire, but the project of an empire, and had to choose whether to make it real by creating an equal union with its colonies in America or to abandon the project. He was very critical of the monopolistic trade relationship that Britain had imposed on its colonies and blamed the “mercantilist system” for the mismanagement of that relationship. The gist of his argument was that Britain should either grant independence to the American colonies (which he conceded would be much resisted at home) or grant them equal representation according to the taxation they paid (which, he was adamant, would mean that in the long term the capital of the empire would have to move to North America).

Another thinker who emerges as a subtle critic of imperialist practices in much recent literature is Edmund Burke, who has received praise for, among other things, showing genuine concern about the British failure to show empathy with “the other,” the peoples the British ruled, be they Indians, Catholic Irish, or St. Eustatius Jews. Burke’s notorious persecution and impeachment of former governor Warren Hastings was only one of the manifestations of his concern for the mismanagement and oppression of the inhabitants of the Indian subcontinent. His speech in defense of Charles James Fox’s East India Bill (1783) was another famous instance. Burke also emerged as one of the most interesting critics of British attitudes toward the American rebels during the American War of Independence. His attempts at conciliation with the American rebels failed, but his arguments on how best to run the empire became classic references for subsequent debates for many decades.

A most interesting group of political thinkers, economists, and activists who were implicated with imperial thought and practice were the British utilitarians. One of them in particular, James Mill, has been taken to task by recent scholarship for his prejudiced treatment of Indian civilization and for

his abandonment of some of his Scottish predecessors' (primarily Adam Smith's) tolerant sociological explanations of observed differences, replacing them with his simplistic binary distinction between "civilized" and "barbarian" societies and attributing the failures of "barbarian" peoples to their mental states (Pitts 2005, pp. 123–33). On the other hand, Jeremy Bentham has been praised for his open-mindedness, and for his refusal to accept James Mill's binary distinction and scale of civilizations. Bentham emerges particularly favorably in Pitts's analysis, which differs from earlier scholarship on Bentham on colonies, notably by Donald Winch and Lea Campos Boralevi, who had pointed to the inconsistencies and shifts in Bentham's position on colonization and empire. Pitts interpreted Bentham as having displayed a more consistent antagonism to empire than other scholars would accept.

Next to his father, John Stuart Mill has come in for the harshest criticism of all (Mehta 1999; Pitts 2005). His acceptance of the binary distinction between "civilized" and "barbarian" peoples and its reductions is taken to task for having led to a particularly distorted picture of the whole "East" lumped together as a society of barbarians whose minds are still in their infancy and need guidance. Although not all the criticisms that have been raised against the younger Mill in the last few decades are equally valid (see Varouxakis 2013, pp. 101–44), there is no gainsaying that he did not develop a fully convincing answer to the problems posed by ruling backward societies and raising them to independence. (Perhaps his 35-year-long employment in the East India Company had much to do with the strengths and weaknesses of his approach to the non-European world and India in particular.) While J. S. Mill may have had a remarkably self-conscious aspiration to cultural open-mindedness (and while he may have displayed a considerable degree of such open-mindedness and aversion to ethnocentrism as far as other European societies were concerned), he showed himself relatively uninterested in cultural diversity in the non-European world and in non-European cultures.

The best-known liberal political thinker to defend imperialism and to recommend it for France to pursue was Tocqueville. Tocqueville was anxious to preserve political engagement and interest in public concerns in France in the face of what he saw as the growing atomization and

individualism of his compatriots—and of people living in what he referred to as the “democratic state of society” more generally. It was as a way of combating such dangers that Tocqueville approved of the exercise of French power in Algeria and elsewhere, although he was fully conscious and explicit that such rule was not in the interest of the dominated. Thus, Tocqueville is liable to the charge that he essentially sacrificed the interests of the colonized peoples to the paramount (for him) need to offer the French people a great object of ambition for the exercise of national pride and *grandeur* and the undertaking of a grand national unifying project (see Pitts 2005, pp. 204–39).

Empire and the problems it posed for political thought did not refer only to whether and how to rule alien “backward” peoples though. Another major aspect of political thought on empire was reflection and debate on what to do with the settler colonies. Shortly after the first Gladstone government came to power in 1868, there were widespread rumors that the government, under radical influence, would abandon the settler colonies (Canada, Australia, New Zealand, South Africa). Radical criticisms of the costliness and uselessness of the settler colonies, already vociferous with Richard Cobden and John Bright and most influentially articulated again in 1862–63 by the historian Goldwin Smith, were seen as having won over the Liberal government. A movement as widespread and ambitious as it was vague and diverse emerged by the late 1860s and became more vociferous as of 1870 and until the beginning of the twentieth century, calling for “imperial federation.” There were rich and animated debates over the question of the potential union of the United Kingdom with its “settler colonies” during the last three decades of the nineteenth century (Bell 2007). This new global polity, “like a world-Venice, with the sea for streets” (as J. R. Seeley memorably put it in *The Expansion of England* 1883, p. 283), was to guarantee both British strength and a just and stable world (the two went together in the eyes of its proponents).

The popularity of the idea of imperial federation in its various versions would not have been possible without the concurrence of two different kinds of development. The first was the increasingly strong anxiety about the future of Britain both as a world power on the international stage and internally, as democracy and its concomitants were seen unfolding. But

these anxieties would not have been sufficient were it not for the cognitive shift that was made possible by the communications technologies that facilitated increasing levels of economic interdependence. After around 1870, earlier misgivings about the possibility of a transcontinental state became increasingly less convincing, as a result of technological advances such as transoceanic steamships and the electric telegraph, which enabled an imaginative revolution that made the world look smaller and distant continents feel closer. The imperial federalists were conspicuously unclear about the details of the workings of the global state they envisaged (see Bell 2007).

The emphasis of most of the recent literature on different kinds of supporters of empire in the nineteenth century should not obscure the fact that there were some consistent and vociferous critics of empire in the nineteenth century, not least in Britain (Claeys 2010; Matikkala 2011). By far the most interesting group of British critics of empire and imperialism were the British followers of Auguste Comte, the devotees of the “religion of humanity.” Richard Congreve, Frederic Harrison, Edward Spencer Beesly, and John Henry Bridges were the leading British Comtists. It was part of the vision of global order envisaged by the French philosopher and founder of sociology that empires of conquest should be dissolved and large states should be broken down into smaller republics. The attitude of the Comtists toward empire and imperialism has recently been most fruitfully studied by Gregory Claeys. Claeys (2010) deals with great sensitivity and in unprecedented depth and detail with the pioneering and remarkable contributions to antiimperialist thinking produced by the British Comtists. It is not just that Comte’s British followers were the first to come up with the economic explanations of imperialism usually associated with J. A. Hobson. It is also that the Comtists came up with an astonishingly vociferous, sustained, and sometimes influential campaign against empires of conquest, starting as early as the mid-1850s and continuing until the 1920s. Claeys very correctly emphasizes the importance of the positivist “religion of humanity” and its crucial role in determining their anti-imperialist stance. It was the fact that the positivists believed in the unity of the human race and considered all peoples of the world “our brothers and fellow-citizens of the world—children of the same great kith and kin,” as Frederic Harrison put it (Harrison 1908, p. 247), that led them to attack

empires of conquest as vociferously as they did. It was, at the same time, the ridiculous aspects of the rituals imposed on that religion by its founder that led to them being derided by many contemporaries and later underestimated by condescending historians. But while their “religion” and “church of humanity” never managed to convert great numbers of Britons, their political message regarding imperialism was much better received among parts of the intellectual elites of Victorian and Edwardian Britain.

The positivist critique of empire influenced the much better-known arguments on imperialism articulated by J. A. Hobson in *Imperialism* (1902), which would in turn help to inspire the most famous Marxian critique of empire of the epoch, V. I. Lenin’s *Imperialism: The Highest Stage of Capitalism* (1917). Much of the critique of empire in the twentieth century occurred in terms of Marxist analyses. Hobson had given priority to explaining later modern imperial expansion in terms of the need to export surplus capital amid declining rates of domestic profit and the desire to expand markets, and the effective power of finance capital in persuading national governments to send troops to help secure such aims. Vladimir Lenin, Joseph Stalin, Mao Zedong, Ho Chi Minh, Fidel Castro, and other socialist leaders embellished these themes throughout most of the century. By the mid-twentieth century, many such writers also alleged that the removal of traditional imperial methods of rule did not prevent a neocolonial relationship, often based upon debt, from developing or being maintained, leaving former colonies notionally free of their masters but in fact as much exploited economically as ever. A further debate that emerged respected the desirability of the violent overthrow of colonial regimes, with the Algerian psychiatrist Frantz Fanon asserting that violence could help liberate colonised peoples from the inferiority complex imposed upon non-white races, while Mohandas Gandhi famously espoused non-violent methods to eject imperial oppressors. The search for raw materials doubtless played a major role in the expansion of both National Socialist Germany and imperial Japan in the 1930s and 1940s. The breakup of many of the great nineteenth-century empires by 2000, including part of the former Russian empire inherited by the Soviet Union, brought into play powerful new nationalist forces and rivalries. A persistent, indeed growing, search for raw materials, and especially oil and gas, by the more developed countries also brought renewed interest in securing sources of supply in the

Middle East in particular in the late twentieth century. A variety of debates arose from these factors respecting the validity and/or desirability of “liberal” interventionism to prevent ethnic conflicts in newly emerging nations, and to secure “regime change” where recalcitrant rulers failed to march to the tune of superpower bandmasters. In the early twenty-first century, few empires of the traditional type remain, and international order is maintained in part not only by global superpowers such as the United States and China, but also by the United Nations, a moderately more effective body than its predecessor, the League of Nations. Substantial tensions remain resulting from population growth, shortages of resources, global climate change, ethnic and national rivalries, uneven development, and economic deprivation. Imperialism itself, however, is widely regarded as a morally bankrupt concept. But if the “age of empires” has passed, the legacy of imperialism remains powerfully present in many parts of the globe.

Engels, Friedrich

Friedrich Engels (1820–95) grew up in the manufacturing town of Barmen, now a part of Wuppertal, in Germany, where his father owned a factory manufacturing lace and ribbon. The eldest child of eight children in a strongly Christian family, he was a gifted child for whom his parents had high expectations. It was thus a great disappointment to them when he turned to both atheism and communism. The parental unease was caused not just by shame, but also by the illiberal Prussian political framework that made all dissent distinctly dangerous. So after a year employed as a clerk for his father's firm, Friedrich was sent to work for his father's export agent in the north German port of Bremen. His parents thought that he would be better off away from undesirable influences including his radical school friends, although in fact he was more radical than they. Lodgings were arranged with a pietist clergyman, but Engels still enjoyed the freedoms of a large urban center where he had access to political pamphlets forbidden in his home area. From Bremen, he wrote to a friend that he was becoming a Hegelian. Berlin remained the center of radical Hegelianism, and it was there that Engels chose to do his military service. Something of this stayed with him, for he cultivated a military image (and always looked smart in contrast to the more bohemian Marx) and in 1849 used his training to support revolutionary forces in Elberfeld and in Baden. He also wrote numerous articles on military affairs and became known in the Marx family as the General. To his father, the army in Berlin must have seemed a bastion

of traditional morality, but Engels used his free time to pursue his philosophical interests.

Engels's link with the Young Hegelians brought him into contact with Karl Marx, who had studied at Berlin and had left just a few months before Engels arrived. Marx had become editor of the *Rheinische Zeitung* in October 1842. When the two met in Cologne a month later, Marx associated Engels with the radical Young Hegelians in Berlin from whom Marx now wished to dissociate himself. The first meeting, then, was not auspicious; however, a year later, Marx read Engels's "Outlines of a Critique of Political Economy" and was greatly impressed. For Marx, Engels had provided just what the Young Hegelians most lacked—an understanding of political economy from a philosophical perspective. He could also write well and incisively and had a knowledge of social conditions in England. He next met Marx in Paris in the summer of 1844 when returning to Germany after nearly two years in England. This time, his reception was much warmer, and so their collaboration began. Together they produced the foundation texts of what became known as Marxism, a label that implicitly designates Engels as the junior partner. However, his contribution was substantial. Engels became Marx's closest friend and intellectual collaborator. It was Engels who first directed Marx to the study of economics, who first acquainted him with factory conditions in industrial England, who advocated and popularized their shared beliefs, and who was Marx's major source of financial support during thirty-four years as a refugee in London. For more than half of these years, Engels continued his work in the Manchester branch of the family firm, leading a strange dual existence as businessman and revolutionary. He was outwardly the very picture of respectability, for he attended the concerts of the Hallé orchestra, rode with the Cheshire Hunt, and became Chairman of the prestigious Schiller Institute. Simultaneously, however, he corresponded regularly with Marx in pursuit of their revolutionary aims, and away from the city center maintained a second home where he lived with Mary Burns, a working-class Irish woman. She died in 1863, and Engels was happy to be able to retire in 1869 at the age of forty-nine. A year later, he joined Marx in London where he lived until his death in 1895.

Early Writings: Economics and Revolution

One way of understanding Marxism is as an economics-based explanation of history. It was Engels's 1844 article on "Outlines of a Critique of Political Economy" that led Marx to focus on the study of economics. Much that was to become familiar is already present here: the denunciation of the system of economic competition, the assertion that the gulf between capitalists and workers is antagonistic and bound to deepen and that social polarization will occur, the tendency of competition toward economic monopoly, and the belief that regular trade crises are endemic in a system that will reach its destined end in a social revolution. There is also the scathing denunciation of Thomas Malthus that, like much else in this article, was later to find fuller expression two decades later in Marx's *Capital*.

From a treatise on economic theory, Engels turned to actual social investigation. His *The Condition of the Working Class in England* ([1845] 1968) is a pioneering work of social history and remains instructive and interesting. At the time, Great Britain appeared to most people as monarchical and aristocratic. To Engels, this was a veneer hiding a rather different reality. For him, the dominant influence was the commercial middle class—what he called the bourgeoisie. In fact, thought Engels, the bourgeois class had been ruling in Britain since the so-called Glorious Revolution of 1688 and the industrial bourgeoisie since 1830. Engels described bourgeois class power as arrogant, overbearing, devoid of conscience, and blind to the consequences of its single-minded pursuit of wealth. It was the bourgeoisie who exploited the working classes. For evidence, Engels cited the 1834 Poor Law, framed, he believed, in accord with Malthus's law of population and constituting an open declaration of war against the workers.

Engels had been converted to communism by Moses Hess, who, in *The European Triarchy* (1841), had argued that European progress required that German philosophy combine with French political experience and the practical sense of the English. Hess, then, put these three nations together at the forefront of development. For Engels, however, who was moving toward an economic interpretation of history, Britain's level of industrialization put it at the forefront. Consequently, Britain was where the workers were most numerous, most oppressed, and most distinct; hence,

they were nearest to socialism. Engels then outlined a developmental scale according to which workers in the cities were more advanced than those in the countryside and those in industry more than those in handicraft or agriculture. Within industry, too, a gradation was evident. The factory hands were more enlightened than the miners, and the cotton industry was the most mechanized; consequently, its workers stood at the head of the labor movement and were the most hated by their employers. In this pattern of development, the most advanced workers confronted the most aggressive bourgeoisie. For Engels, the revolutionary culmination of this conflict was as inevitable and law-governed as any physical disease. The great French Revolution of 1789 demonstrated what was involved.

A few of the major writings of the 1840s have Marx and Engels listed as joint authors. In these cases, it is not easy to allocate prime responsibility. *The German Ideology* of 1846 (1972) was mostly penned by Engels even though some leading scholars have judged the contents to be more typical of Marx. It was, however, the product of joint discussions between them and can be regarded as the initial basic document of Marxism. Here, Engels and Marx asserted that the forms of morality and religion are not independent but are ideological, relating to people's socioeconomic situation and material interests, in the same way that German philosophy had to be understood as relating to German reality.

The 1848 (1983) *Manifesto of the Communist Party* was first published anonymously and then later under joint authorship, but the writing was done by Marx and shows some clear divergence from the views of Engels. For example, Engels's earlier view that England was at the forefront of revolutionary possibility is not confirmed. Rather, Germany is named as the country to which communist hopes are directed. This difference is clearly Marx's rejection of Engels's view, for in April 1848, Engels still maintained his optimism regarding England, offering his brother-in-law a bet that his Chartist friend George Julian Harney would be British foreign minister within two months. When those two months had elapsed, it was clear that Chartist agitation had not matched the scale of revolutionary events in France and Germany. Engels then adjusted to reality and relegated Britain to a much lower place on the revolutionary scale alongside Russia and Prussia.

After the failures of the 1848 to 1849 revolutions, Engels turned his mind to their German predecessor in *The Peasant War in Germany* ([1850] 1926) in the sixteenth century. Engels was particularly interested in Thomas Münzer, whose outlook, he thought, foreshadowed communism, but whose egalitarian policies were too advanced for the prevailing socioeconomic conditions. This study is the first example of Marxist history writing in that it is not primarily a story of great individuals, warriors, and kings, but of social groupings—princes, nobility, patriciate, clergy, peasants, serfs, and town plebeians. Furthermore, it relates the political aims of these separate groupings to their respective economic needs and interests.

For the next nineteen years, Engels worked in Manchester for Ermen and Engels, the family firm. During these years, he produced a large amount of journalism, some of it for the *New York Daily Tribune* and the *New York Times*, some of which was originally published under Marx's name. Engels was particularly interested in military affairs and wrote on both the Crimean War and the American Civil War. His articles for the *New America Cyclopaedia* (1857–58) included the entries on “Army,” “Cannon,” “Fortification,” “Infantry,” “Navy,” and “Armada.” Engels also continued his voluminous correspondence with Marx in London, whom he continued to subsidize, but produced no major writing. Such writings, then, fall conveniently into early and late periods.

Later Writings: Socialism and Science

When Engels moved back to London in 1870, political events also moved in his direction, most notably with the Paris Commune of 1871. In March of that year, following French military defeat by Prussia, the citizens of Paris set up their own revolutionary commune. It lasted only six weeks but inspired immense hope among socialists and great fear among their opponents. Engels described it as a dictatorship of the proletariat, the form of class rule that was necessary for the period of transition between capitalist and socialist systems, a viewpoint that had a strong influence on Lenin after the Russian Revolution of October 1917. However, the drama of the Paris Commune was brief. More durable was the rise of parliamentary socialism, particularly in Engels's homeland of Germany, where a socialist party was founded in 1863.

Marxism became known during the last quarter of the nineteenth century through its growing influence in European labor movements. During his lifetime, Marx had completed only Volume I of *Capital* (1867). Although not widely read, it became quite well known, partly due to the propaganda efforts of Engels, who wrote a number of reviews. *Capital* was taken to have demonstrated scientifically that the instabilities of capitalism rendered inevitable its revolutionary overthrow and replacement by communism. After Marx died in 1883, Volumes II (1885) and III (1894) of *Capital* were put together by Engels, virtually the only person who could read Marx's handwriting. However, the volumes were probably more honored than actually read.

The real basic textbook of European Marxism in the late nineteenth century was Engels's *Socialism: Utopian and Scientific*, one section of a longer work called *Anti-Dühring* ([1878] 1976). Here, Engels sought to distinguish his own views from some of the doctrines and sects with which Marxism was in competition. They were collectively labeled and denigrated as utopian socialism. The main writers of this tendency were taken to be Henri Saint-Simon, Charles Fourier, and the factory owner Robert Owen. Though heavily criticized, these writers were not without merit; far from it, for, said Engels, they had perceived the enormous gulf that divided liberal philosophy from the prevailing social realities. They had uncovered the hypocrisies behind existing society and so their insights aided the education of the working class. Saint-Simon, for example, had declared that the central problem of modern society was to improve the conditions of the poorest class. Such a formulation certainly appears in accord with Engels's own priorities, so why the epithet utopian and why the need to distance himself from them?

The answer lies in the idealism of their theory and the elitism of their politics. The utopian socialists allegedly shared with the Young Hegelians the inability to perceive the relationship of their philosophy to the development of society at large and so lacked an accurate account of its own development. For Engels, on the contrary, nothing major occurs by chance. Socialism has socioeconomic (and not merely intellectual) preconditions. Before socialism is meaningfully on the agenda, economic

development has to have generated capitalism, then industrialization, and then the modern urban working class.

Utopian socialism, then, was taken to be the limited ideology of what was merely the early, immature, and now superseded stage of the industrial proletariat's development. Consequently, the movement was not yet seen as self-determining with the workers as the agents of their own emancipation. According to the utopian socialists, the workers needed a great man to show them the way; the poor were to be led and then administered. For this reason, Engels judged their theory of social change to be not only merely false, but also paternalistic. Furthermore, the precise moment at which the great man of genius appears, the savior with the rational plan to transform society, seems completely arbitrary. He could, quipped Engels, equally well have appeared a few centuries earlier and so have saved humanity long ages of exploitation and suffering. Equally arbitrary, consequently, is the precise historical moment at which social justice can be implemented.

The utopian socialists, furthermore, were blamed for regarding their own conclusions as objective social truths. They imagined themselves as somehow standing apart from society and viewing it from an outer and overall perspective. As such, they regarded their theories as equally applicable to all sections of society, so they appealed to society at large rather than, as Engels thought they should, to the proletariat in particular. As with Thomas Paine at the end of the eighteenth century, the strength of reason was presumed capable of removing all obstacles in its path. For the utopian socialists, a true science of society required only reason for its formulation and administration for its implementation. In Engels's view, they thought that society would yield to their personal initiatives. Politics was virtually excluded, revolution definitely so. The utopian socialists assumed that the example of their small-scale experiments would make the required impression on the rest of the world. This echo of eighteenth-century radicalism was derided by Engels as both unrealistic and conservative: unrealistic, as the beneficiaries of a particular social order would not peacefully submit to its planned abolition, and conservative, in that a politics of consensus merely causes stagnation in a society torn apart by deep class divisions.

The whole point of Engels's analysis was to argue that utopian socialism had been superseded. This was an age in which the concept of science had great prestige; hence, social science, Christian science, and from Marx and Engels, the claim to provide scientific socialism. What was it, then, that could make socialism scientific? One part, for Engels, was the heritage of Georg Wilhelm Friedrich Hegel. His dialectical method not only saw all the elements of society as interlinked, but also perceived the antagonisms between the various sections that led to the next stage of social progress. The other part was materialism, the understanding of the real base from which development arises. This, thought Engels, was class struggle rooted in the current mode of economic production. It was the economic structure that provided the base from which arises a congruent superstructure of law, politics, and ideas. Engels concluded the work with a brief overview of social development, the point of which was to demonstrate that capitalism was now anachronistic and that it was the task of the proletariat to overthrow it and bring the means of production into common ownership.

Largely through *Socialism: Utopian and Scientific*, Marxism got into the European labor movement in the form that Engels gave it. His writings were both less complex and easier to read than those of Marx and were, therefore, accessible to a wider readership. Engels's neat packaging of history facilitated the transformation of theory into ideology. A significant instance of this is found in his writings on the state. One of the best-known parts of the Marxist doctrine is its theory of the state. This is taken to be the view that in each social formation the actual state structure is the instrument of its ruling class. Consequently, under ancient slavery, the state was in the hands of the slave owners who used it to hold down the slaves, under feudalism it was the instrument of the landed aristocracy who used it to dominate the peasant serfs and bondsmen, and under capitalism it is used by the bourgeois class to oppress the proletariat. This orthodox Marxist view was actually never explicitly stated by Marx himself; he noted that the capitalist state was usually a class instrument, but he did not generalize over all previous modes of production. So what has been taken to be the orthodox view of the state was first clearly and fully documented by Engels in 1884. It is not merely that Marx did not formulate it; the writing was not even seen by Marx, who had died a year earlier.

Engels lived twelve years after Marx's death and so was a fuller witness to the growth of parliamentary socialism, especially in his native Germany. The dominant view of Marxism is that it is a doctrine of revolution. In the main texts, confirmation of this view is not hard to find, and it is unsurprising given that political Marxism is predominantly a product of the 1840s. At that time, workers had not been granted full citizenship status; they did not have the parliamentary vote, and their trades unions, if legal, were barely tolerated. Riots or revolution seemed to many the only way in which their grievances could be made known. This, however, is not the whole picture. In the 1840s, Engels had quite explicitly aligned himself with the British Chartist movement, whose aim was not bloody revolution but parliamentary representation. Implicit in Engels's writings is that both paths could lead to the same destination. The working-class vote could be revolutionary if it were used to upset the whole previous constitutional structure. In the 1870s, when the German Social Democrats were gaining seats in the German parliament, Engels and Marx were often critical of their precise tactics, but never of their parliamentary orientation as such. It seems that they were much less dogmatic than many of their followers and were happy for the workers to take whatever opportunities for advancement were available. However, in Engels's last decade, a definite shift of emphasis occurs, for now revolution seems dangerously counterproductive, likely merely to result in suppression, whereas legality is bringing socialism ever nearer.

Engels's interest in the natural sciences is evident in his *Dialectics of Nature* (written 1875–76; published 1925). Part of his concern was to combat the people we now call creationists. There is more than a hint of German nationalism in his view that Charles Darwin completed the intellectual revolution actually begun by Kaspar Wolff of Berlin in 1759. Engels also asserted that just as mankind has a history of development, so too does all of nature and even the solar system. The development from birth to death is universal. There is a powerful paragraph in which he envisaged a time when the earth will become too cold for all organic life and then disappear, rather a remarkable shift from the normal communist optimism about the future.

In *The Origin of the Family, Private Property and the State* ([1884] 2010), Engels drew on recently published anthropology for an account of mankind's early development, especially in respect of family structures. He related family type to its appropriate stage of human development. Thus, savagery had group marriage, barbarism had pairing marriage, and civilization had monogamy. The change from matrilineal to patrilineal families eventually led to patriarchy and the monogamous family. Engels saw this as a victory for private ownership over original common ownership. It signified the subjection of women to men, the first form of class oppression. Engels then turned to the North American tribe, particularly the Iroquois, where everything allegedly ran smoothly in spite of there being no state structure, no slavery, and no sexual inequality. Engels clearly found this rather appealing, but concedes that society was economically very undeveloped. It was destroyed by the base motives of greed, selfishness, and avarice that ushered in class society.

For the next stage, Engels turned to ancient Greece and Rome, then to the Celts and Germans, outlining how ever greater variations of wealth led to the need for the state as an institution that protected the propertied from the unpropertied. He then considered the feudal and bourgeois states before reaching his main analytical point: a reminder that the state has not always existed. It arose at the point in history when class differentials needed to be maintained. This need provided the guide to its eventual disappearance, for when, under communism, class ceases to exist, the state will become unnecessary, relegated to what he called the Museum of Antiquities. Engels provided just one brief mention of this future condition in pointing out that under communism the family would cease to be the basic economic unit of society. The care and education of children would be taken over by society as a whole, although precisely how this would operate is not explained. A consequence, however, would be that a marriage form liberated from economic considerations would be based solely on mutual love, so it would be genuine and free for the first time in modern society.

Engels's last major writing was *Ludwig Feuerbach and the End of Classical German Philosophy* ([1888] 2001). It provides an account of his and Marx's relationship to, and emancipation from, Hegelianism. Here, he asserted that the same laws applied to both human history and to the natural sciences, but

he made the obvious point that people are distinguished from the rest of nature by pursuing their goals consciously. This distinction makes it appear as if historical events are governed by chance, but, says Engels, there are hidden laws also determining social development. These laws he claims, with Marx, to have uncovered. Their essence is that class struggle based on economic interests is the moving force of human history. His account of the materialist view of history has a focus on religion and includes the assertion that Catholicism is the natural ideology of feudalism and Protestantism of bourgeois society.

Engels was clearly a remarkable autodidact who produced fluent commentaries that ranged over the sciences, philosophy, and all of human history. These writings are admirably well written, but those relating to science now find little approval. They are, however, not insignificant, for they have often been granted the doubtful accolade of underlying the scientific orthodoxies of the Soviet Union.

English Enlightenment

The very title of this entry might already arouse debate and contradiction. Conservative or neoconservative historians of ideas have long denied, sometimes explicitly, more often by silence, the existence of an English Enlightenment. But more striking than the politically motivated denial is the neglect of the subject in scholarship. In his influential book *The Creation of the Modern World: The Untold Story of the British Enlightenment*, the late Roy Porter (1946–2002) opened his own exploration of the field with a motto he found in J. G. A. Pocock’s “Clergy and Commerce: The Conservative Enlightenment in England” that underlines that the historiography of the English Enlightenment has long remained a neglected field, even a “black hole” (Porter 2001, xvii; cf. Pocock 1985, 528). He also refers to the fact that very few books (or even none before his own) have used the terms English Enlightenment or Enlightenment in England in their titles (ibid., 5; an exception is J. Redwood 1976). While he did much to fill the gap with his book, Porter is certainly right with his diagnosis that the Enlightenment in England has received much less scholarly attention than its German (*Aufklärung*) and French (*Lumières*) counterparts, or even England’s northern neighbor, with the Scottish Enlightenment now a well-established field. A prominent example to illustrate that state of scholarship is Ernst Cassirer’s (1874–1945) otherwise magisterial, though now dated, study, *The Philosophy of the Enlightenment* ([1932] 1951), which treats Lord Shaftesbury in some detail. Shaftesbury had long been favored in German scholarship (Weiser 1916) and mentions John Locke, John Toland,

and Matthew Tindal here and there (though not often), but he leaves out many other authors who might be considered eminent representatives of the Enlightenment in England. The fault is not so much Cassirer's personal stand; it reflects an approach to the Enlightenment that concentrated on those who were then considered the leading philosophers of the period, at the expense of the vectors and impact of the movement, of the interaction between the ideas and their social, political, and other contexts.

While the neglect of scholarly attention to the Enlightenment in England cannot be doubted, it remains somewhat puzzling, for the Continental perception of the phenomenon at the time was strong. The liberty of expression, enhanced by the progress of printing techniques; the admirable advances in the sciences, from Francis Bacon and Isaac Newton onward; the improvements of living conditions; religious toleration with its corresponding abhorrence for fanaticism; and last but not least, the whole sphere of political institutions and culture in England—all these achievements were celebrated by the foremost representatives of the Continental philosophes, by the different versions of enlightened Europe: the *Aufklärer* in the Protestant territories of what was to become Germany, *les Lumières* in France, *gli illuministi* in Cesare Beccaria's Lombardy, and so on. Was Newton, for example, not almost deified by Francois-Marie Arouet Voltaire, an object of admiration and a source of inspiration for Immanuel Kant, and popularized “for ladies” by Francesco Algarotti (1712–64)?

Where to begin? Seen from a Continental perspective, the middle of the eighteenth century seems indeed the high time of the Enlightenment. Most of the leading lights of the movement published their major works from the 1750s to the 1780s. This relatively short time span covers most of Denis Diderot's and Jean-Jacques Rousseau's texts, Beccaria's *On Crimes and Punishments* (1764), much of David Hume's and all of Adam Smith's works, and most of Moses Mendelssohn's and Gotthold Lessing's texts, with Montesquieu's *De l'esprit des loix* appearing just before (1748), Voltaire publishing some of his works a little earlier, and some of Immanuel Kant's texts a little later. Of course, there have always been forerunners or pioneers—the latter is probably a better term, for it does not imply exclusion from the movement. Thus, Porter's criticism of Robert Darnton's

expression of the pre-Enlightenment seems justified (Porter 2001, xvii, 485), but since early Enlightenment has been much used to qualify figures such as Christian Thomasius (1655–1728) on the Continent, why not use the same device for England. There seems at any rate no reason to sever Locke and the Third Earl of Shaftesbury from the Enlightenment, just because the former died as early as 1704 and the latter in 1713.

Obviously, space constraints do not allow a full presentation of, for example, Locke's political philosophy, although there is no shortage of good commentaries on it (cf. the numerous publications of John W. Yolton and John Dunn)—and it would hardly be satisfying to provide a list of relevant English authors from Locke onwards to James Mill at the far end, with a few sentences of philosophical exegeses on each figure. To cover all the subject matter evoked in the second paragraph would take a rather large book and thus cannot be an option either. What will be attempted then, in what follows, is a branch line in the understanding of the Enlightenment in England; however, it is an important one, especially when one looks at it from the angle of the uptake of English thinking overseas—an aspect that Porter neglects, as he admits himself, in spite of his awareness that “insular history has no virtues” (Porter 2001, xx). Though it is not easy to give a single name to this branch line, it encompasses rational religion, deism, the advancement of religious toleration, and the corresponding battle against bigotry, fanaticism, persecution, and religiously motivated civil war; thus, it also deals with religion and politics and, in general, with the rise of a lay and secular society in England. Of course, in spite of the largeness of this field, it does not cover all the Enlightenment, *tant pis*, no less a witness than Hume would not have shrugged at the suggestion that the Enlightenment was primarily the emancipation from religious prejudices and judging on the basis of Peter Gay's two-volume tour *de force*, we would touch more than half of it at any rate. But there are at least two more serious reasons for the option taken. First, this branch line certainly leads to what is central and to some extent specific to the Enlightenment in England—that the widespread acceptance of new mental attitudes and values was more important than the achievements of profound philosophies such as the one exposed by Kant. Since this went against Cassirer's inmost convictions, he could never be in a position to appreciate what England contributed to the Enlightenment. J. C. D. Clark might have been closer to the truth when he

wrote that Locke's ideas on religion had a greater impact on eighteenth-century England than his "import of contractarianism into politics" (Clark 1985, 47). The second argument stems again from a continental perspective: the chosen branch line reveals the impact of Deist ideas and religious critiques from England on such important German figures as H. Samuel Reimarus and Lessing, on Pietro Giannone and others in Italy, and even on the philosophes themselves, against the dated vision of Paris as the epicenter of the Enlightenment, were much stimulated by them (cf. Torrey 1930 and Venturi 1971).

Locke shared a number of convictions with Pierre Bayle. It cannot be excluded that they met when Locke was living in exile in Holland, and Locke might well have taken over some of Bayle's views on toleration, but he was, as Martin Fitzpatrick (2000, 38) wrote, "[t]he more systematic thinker," and more importantly, he had a greater impact on his compatriots. Indeed, Locke became undoubtedly the champion of toleration in England, and he laid the basis for the deep transformation that took place in the eighteenth century with the result that, toward the end of it, an English gentleman could without contest be religious on his own terms, a phrase that meant nothing less than that belief had become "a matter of private judgement" (cf. Porter 2001, 98).

Specialist scholarship may well distinguish between Locke's views on toleration before and after the middle of the 1660s, with the later period marked by his writing around 1767, the posthumously published "An Essay Concerning Toleration" opening up his lasting stand on the question—though the broad, contemporary, and later reception of his views has often ignored such subtleties. The modifications toward his mature position took place in the context of Locke's reflections on economic matters and the related questions of private law. Though he does not discuss in any detail how toleration would contribute to increase the prosperity of the kingdom, his programmatic formulations do not leave any doubt that it will do so. Still later in life, when in exile, his personal experience of Dutch conditions must have reinforced that opinion. Stripped to their bare essentials, and at the risk of oversimplifying the issue, Locke's arguments in favor of toleration stem from the principle that the state's action is limited to securing the life, the goods, and the freedom of the citizens. By securing

these, the state will bring peace to society. Even the actions of the citizens that do not enter into conflict with the fundamental tasks of the state are beyond the legitimate intervention of the sovereign; even more so, their convictions or their conscience cannot be coerced anyway. Locke's conception should not be underestimated, for it was beneficial and brought a number of arguments already in use into a coherent and efficient line of reasoning and strategy. But it should not be overestimated either, for his pleading in favor of toleration remained limited to some Protestant dissenters—in this respect, a theoretical recognition of the status quo, for many Protestant sects already flourished in England—while excluding Catholics, Jews, other non-Christians, and of course atheists who might endanger the order of established government (cf. Champion 2000, 134 ff).

In his *The Reasonableness of Christianity*, Locke argues not only against the Calvinists, but also against certain Deists (though he does not call either of them by these names). However, it is legitimate to begin the treatment of the incisive latter current with him, for he upheld the fundamental point not only that religion, properly understood, must be rational, but that reason and revelation are in harmony—and has thus often been included in histories of Deism (cf. Lechler's [1841] 1965 pioneer study, influential even in England). But when Toland created a wide polemic and even scandal with his *Christianity Not Mystrious* ([1696] 1995), his text was perceived by the contemporaries as pursuing (perhaps exaggerating) Locke's reasoning.

To speak of Deism as a current or a philosophical movement is tricky and somewhat misleading, for the term, initially often used pejoratively by people hostile to it, covers in reality a wide spectrum of positions: Deists indeed came, as Porter puts it (2001, 112) "in many colours." This variety or even disparity of the Deists provides a welcome opportunity to underline that the English Enlightenment in general, unlike its Continental counterparts, was not a network, but rather a construction after the face of what was, in reality, a diversity of "intellectual enclaves, dispersed over England" (Thompson 1978, 58). Not every Deist denied the existence or the idea of revelation, but most considered that natural religion, which might also be characterized as a religion of reason, is sufficient (a conviction making revelation almost redundant). Some Deists might add a belief in certain attributes of God and in some fundamental articles of faith, without

necessarily agreeing on a common catalogue of such attributes and articles. Without going into details of individual expressions of their respective convictions, we can say that the Deists (without speaking of Edward Herbert) from Locke and Toland were chiefly represented by Anthony Collins, Anthony Ashley Cooper, Third Earl of Shaftesbury, Samuel Clarke, Thomas Woolston, and Matthew Tindal, without forgetting John Leland's important retrospective of 1754–55, *A View of the Principal Deistical Writers That Have Appeared in England in the Last and Present Century*. Toward the end of the eighteenth century, in 1787, Mary Wollstonecraft summed up the growing popularity of such views saying that it has become "the fashion" among young men to be Deists. And even Robert Owen's much more radical stand on religion may have benefited, in its reception, from the Deists' critique of the various positive, revealed religions.

But more important are the facts that Deism was perceived on the European continent as the distinctly English contribution to the Enlightenment and that Deism enjoyed a wide and strong reception there. Lessing's views on religion and toleration, vital for future developments, as expressed in his late theoretical writings and popularized in his play *Nathan the Wise*, would be unthinkable without his study of the Deists.

Environmentalism, Ecology, and Political Thought

While the term *ecology* was coined by the German biologist Ernst Haeckel in his book *Generelle Morphologie der Organismen* in 1866 to refer to the economy of nature and the interactions between organisms and their environment, traditions of thought with similarities to modern environmentalism can be traced back to classical antiquity. Victor Davis Hanson (1995) has argued that a distinctive agrarianism not only underpinned the socioeconomic development of the ancient Greek polis where Western philosophy was born, but also had considerable normative force there, stressing the moral superiority of the yeoman farmer over the urban commercialist; patience, practicality, communality, and frugality were citizen virtues directly emergent from self-reliant rural life and were in turn validated by such figures as Plato, Aristotle, Xenophon, and Aristophanes. Indeed, it is etymologically accepted that the terms *ecology* and *economics* both derive from the root *oikos* (household), and on Hanson's account (1995), the paradigmatic ancient Greek *oikos* was the private farm. Classical Greece also gave birth to other significant components of a modern environmentalist perspective, such as revulsion at human hubris and the origins of philosophical naturalism. Max Oelschlaeger (1991) argues that Heraclitus was the first thinker to interweave physics and ethics, while Andrew Belsey (1994) has observed that the pre-Socratic idea of *kosmos* incorporated ideas of order, morality, harmony, and beauty as being immanent in the natural world and unfolding in organic spontaneous

development, thus demonstrating Greek roots to naturalist ethics. Similarly, Laura Westra and Thomas Robinson (1997) note that both Pythagoras and Empedocles recognized human kinship to animals, with the former's followers practicing vegetarianism. On the negative side, the Greek philosophical heritage has been criticized by environmentalists for its dualist, anthropocentric tendencies and suspicion of change in perceptible nature; see, for example, Eugene Hargrove (1987) and J. Baird Callicott (1989). However, at least some forms of anthropocentrism can include environmental concern. The emphasis on moral character in Stoicism, for instance, is allied to a belief that the dynamics of nature and fortune cannot be humanly controlled so that wisdom dictates rejecting hubris and cultivating forms of self-reliant happiness that harmonize with the dynamics of natural reason, a perspective that could also incorporate respect for environmental conditions and support for agrarian over urban life; see Allan Holland (1997) and Clarence Glacken (1967). There is nonetheless an important difference between any of these ancient philosophical traditions and modern green thought's core ideals. For while all of these traditions make reference to nature and some can be seen to have modern echoes, such as in Thomas Jefferson's belief in agrarian virtuous self-reliance, none are based on the value of nonhuman nature per se as is the case with contemporary green politics. For the first proto-green invocations of nonhuman nature's value, one must look to the Romantics in Europe and the Transcendentalists in America.

Romanticism, Early Green Thought, Modernity, and Ecology

Though Jean-Jacques Rousseau never advances an explicit account of value in nonhuman nature, his stress on the simple harmlessness of natural man, especially in his *Discourse of the Origins of Inequality*, functioned as a vital touchstone that inspired several themes in Romanticism, most notably the invocation of nature as being a test of truth, a twin to moral authenticity, and a counterpoint to both arbitrary power and the stifling artificiality of excessive convention. Moreover, as Harold Bloom and Lionel Trilling (1973) have discussed, the Romantic emphasis on the depth and development of the human self as it is conditioned respectively by nature

and society helped usher in a new orientation to the natural world, perhaps most notably evoked in William Wordsworth's poetry, in which a dialectical relationship exists between sensitive receptivity to nature and the development of self-knowledge and imagination. To the reader, the greatest lesson of Wordsworth's nature poetry is how to feel, a point to which we shall return, but the stress found in his work, and in that of some fellow Romantics (e.g., Samuel Taylor Coleridge and John Clare in England; Johann Wolfgang von Goethe and Novalis [the pseudonym of Georg Philipp Friedrich Freiherr von Hardenberg] in Germany) on the importance of nature experience for human self-development can be loosely seen as the historic starting point of claims for nature's noneconomic or intrinsic value in human life. At the same time, the generally hostile Romantic reaction to Newtonian mechanism and to the Industrial Revolution significantly prefigured contemporary green social criticisms. A further influence from Romanticism played out in the United States of America, where the Transcendentalism of Ralph Waldo Emerson and Henry David Thoreau further developed the notion that piety and receptiveness toward nature is vital to human development. In particular, Thoreau's *Walden* ([1854] 2004), drawn from his experiment in simple living at Walden Pond, combined inspiration from a life lived in nature with a practical demonstration of frugal living and independence while Emerson's influence helped inspire John Muir (1838–1914), the first president of the Sierra Club and a successful campaigner for the establishment of America's national parks system. Muir's writings built upon the transcendentalist notion that nature was to be revered as God's handiwork to further suggest a nonanthropocentric moral perspective in which all life possessed value and human privilege was reduced or abolished, though the extent to which Muir developed this as a distinct philosophy is contested; see Thurman Wilkins (1995) and Bruce Pencek (2000). Undeniably, however, Muir's thought influenced later attempts to found a nonanthropocentric ethics.

While the Romantic green heritage combined individualism with a generally optimistic emphasis on human development, another important input into environmental thought originated from a pessimistic conservative perspective. The English clergyman Thomas Malthus, fiercely opposing doctrines of human improvement emanating from the French Revolution, developed a theory of population dynamics intended to demonstrate that

human society irrevocably followed cyclical patterns of growth and rapid decline in relation to resource scarcity, thus making arguments for lasting social improvement flawed. His work *An Essay on the Principle of Population* ([1798] 2008), which went through six editions between 1798 and 1826, argued that unchecked population increases geometrically (e.g., 1, 2, 4, 8) whereas food supply increases only arithmetically (e.g., 1, 2, 3, 4), so there is a continuous tendency for demand to outstrip the supply of necessities when population rises, as well as a permanent likelihood of poverty and starvation for some section of the populace. The focus on population rather than on wealth and consumption, along with Malthus's opposition to artificial methods of contraception and his supporters' tendency to advocate (sometimes compulsory) birth control only for the poorer classes, led to sharp criticism from the far left, notably in Friedrich Engels's *Outlines of a Critique of Political Economy* ([1844] 1973), thus prefiguring contemporary debates about the respective roles of population and consumption in relation to sustainability. However, liberal reformist thinkers of the utilitarian school also accepted some of Malthus's ideas in a more optimistic spirit. Thus, John Stuart Mill (1806–73) accepted the basic Malthusian idea of a tension between a sprinting population and a crawling resource base but supported the use of contraception among working people to reduce the spare labor pool and thus increase wages and opportunities for social improvement. Moreover, whereas Malthus emphasized population, Mill tacitly recognized both the role of consumption and wealth differentials, arguing in the *Principles of Political Economy* ([1848] 1994) that a future “stationary state” of zero economic growth was both inevitable and compatible with progress; indeed, he anticipated that after a period of general intellectual improvement, a more egalitarian distribution of wealth and a reduction in economic competition would lead to significant human moral and emotional improvement. Mill was, thus, the first political thinker to advocate a sustainable “steady state” economy of the type supported by contemporary green thinkers, and still more strikingly, he argued for it partly on Romantic grounds, namely the effect of immersion in nature on human character. In this belief, he was partly influenced by his own past experience, for Mill famously suffered a breakdown in 1826 to 1827 in which he was unable to feel pleasure in life; he recovered from this crisis partly with the help of Wordsworth's nature poetry, which evoked his love of nature and “seemed to be the very culture of the feelings I was in quest

of” (Mill [1873] 1964, 116). The lesson Mill drew from this expresses itself in his claim that economic growth should become stationary while some of nature remained undeveloped, for there is not “much satisfaction in contemplating the world with nothing left to the spontaneous activity of nature” and “solitude in the presence of natural beauty and grandeur is the cradle of thoughts and aspirations which are not only good for the individual, but which society could ill do without” (Mill [1848] 1994, in “Of the Stationary State”). Mill was not alone as a nineteenth-century thinker in connecting human well-being to nature aesthetics and radical economic change, an early form of ecosocialism being developed by William Morris, who popularized his views in his 1890 utopian novel *News from Nowhere*.

On the scientific side, controversy surrounds any clear dating of the science of ecology’s birth, with some underlying principles such as the idea of the economy of nature traceable back to pre-Darwinian thinkers such as Carl Linnaeus while the beginnings of the modern ecological laws of species to area relationships can be attributed to the German biogeographer Alexander von Humboldt. Taking Ernst Haeckel’s 1866 coining of the term as a beginning however, the first widely read sourcebook on ecology was the American Frederic Clements’s *Research Methods in Ecology* (1905). Clements proposed that ecosystems undergo processes of successive development that are analogous to the growth of a single organism in which parts act to maintain the integrity of the whole—hence his view that plant ecosystems could be seen as superorganisms. Though Clements’s view was strongly challenged by Henry Gleason and other ecologists, the concept of the superorganism proved an enduring source of controversy. Moreover, Clements’s related notion of a *climax community*, an ecological system that has reached a steady state through processes of ecological succession and in which stability may be partly dependent on internal biodiversity, was a major influence on American green thought. Most significant here is Clements’s strong influence on the farmer, forester, and ecologist Aldo Leopold (1886–1948), whose posthumously published book *A Sand County Almanac* ([1949] 1989) invoked the concept of a land ethic to regulate human interaction with ecosystems, a notion foundational to much contemporary environmental ethics. Leopold’s much cited land ethic formulation that “a thing is right when it preserves the integrity, stability

and beauty of the biotic community” (Leopold [1949] 1989, 224–25) is indebted to Clements’s climax community concept by implicitly equating integrity and stability, along with the background assumption that a diversity of species is required to grant these values to an ecosystem.

Contemporary Green Political Thought

The spur most easily identified with the birth of the contemporary green movement was the 1962 publication of Rachel Carson’s *Silent Spring*. Carson’s book, which carefully examined the dangerous cumulative effects of heavy use of pesticides upon ecosystems, took its title from the possibility of a future world in which no birds sang. It broke the spell of technological optimism that had dominated the postwar West and led to the banning of the insecticide DDT in the United States. It provided a rallying point for the nascent politics of ecology, contributed to the 1970 founding of the U.S. Environmental Protection Agency, and inspired the later political development of both ecofeminism—the philosophy linking patriarchy as the root cause of female oppression and ecological destruction—and deep ecology. The steady rise of the environmental movement was also importantly fuelled by the Club of Rome’s publication *The Limits to Growth* (1972), which used computer modeling to demonstrate with five key variables—world population, industrialization, pollution, food production, and resource depletion—that exponential economic growth is incompatible with finite resources even if technological fixes for problems are found. The book significantly promoted the green view that new political values and action, not merely new technologies, are needed to avoid ecological meltdown.

This emphasis on the need for social transformation as distinct from reformist tinkering has been cast in several ways in the green politics literature. In 1973, Norwegian philosopher Arne Naess began the deep ecology movement with his article distinguishing “shallow” anthropocentric reformist approaches to environmental problems from the “deep” nonanthropocentric perspective that advocates biospheric egalitarianism in ethics, radical reduction in human consumption, production, and population impacts, and a political emphasis on quality of life. A similar but nonidentical distinction is made by Andrew Dobson (1990) in

distinguishing reformist or “light green” environmentalism from radical or “dark green” ecologism, with significant differences implied for political strategies since simple reforms may distract from the real magnitude of required change. Dobson also suggests that at least in its guise as ecologism, green politics may be seen as a new ideology transcending the customary left-right spectrum due to its ambivalent relationship to the Enlightenment tradition: on the one side, contemporary green politics tends leftward in terms of social egalitarianism, but on the other side, the common green skepticism toward large-scale transformations of nature and society represents a conservative orientation. A further important tension is between authoritarian and libertarian wings of ecological thought. Though policies of the late 1960s and early 1970s inspired by neo-Malthusianism tended toward authoritarian measures such as rationing and immigration controls, green parties have steadily moved in a left-liberal direction since with far stronger emphases on decentralist democracy, alternative technology, market-based instruments, and quality of life factors as tools for social change. In addition, one should note a long-standing anarchist strand in green thought, most notably manifest in Murray Bookchin’s social ecology, a theory that draws upon ecology, socialism, ecofeminism, and Peter Kropotkin’s anarchist theory to charge that social problems, primarily hierarchy and statism, are at the root of ecological crisis.

Though radical variants of ecosocialism, ecoanarchism, deep ecology, and ecofeminism remain strong in the green movement, a tendency to more reformist means has been increasingly ascendant in green politics ever since the 1987 World Commission on Environment and Development (the Brundtland Commission) Report and since the 1992 Rio Earth Summit popularized the term *sustainable development*. The concept of sustainability that emerged is a highly contested one, with multiple competing definitions and a central division between sustaining a level of human welfare over a given time span (weak sustainability), as favored by many standard economic models, and a steady state economy based around the sustaining of particulars, such as natural capital (strong sustainability), as favored by most greens and perhaps anticipated by Mill. One manifestation of the new reformism is an increased interest in the compatibility of core green values with liberalism, and much important recent work, such as that by Marcel Wissenburg (1998), Dobson (2003), Simon Hailwood (2004), and Bryan

Norton (2005) has stressed options for capturing green goals within liberal democratic frameworks.

Equality and Egalitarianism

Equality and egalitarianism

Equality and Egalitarianism

At least since the French Revolution (1789–99), the ideal of equality has played an important role in politics and political theory. Indeed, today, virtually everyone believes in some kind of equality, such as equality before the law, political equality (e.g., as captured in the slogan “one person, one vote”) or, more demanding, social equality. Furthermore, social movements working for the emancipation of oppressed groups have often framed their claims in egalitarian terms, for example, in terms of *equal rights* or *equality of opportunity* for workers, women, blacks, gays and lesbians, ethnic and religious minorities, the elderly, people with disabilities, and (even) nonhuman animals.

However, while virtually everyone believes in some kind of equality, not everyone is an egalitarian in the contemporary sense of the term. Thus, the terms *egalitarian* and *egalitarianism* tend to be used to refer to people or theorists who endorse not only judicial and political equalities of the kind mentioned above, but also some form of social equality, requiring, at a minimum, a (significant) redistribution of resources, including income. This requirement is why egalitarianism is mostly associated with the political left.

As a social ideal, equality is constitutive of justice in the sense that, according to egalitarians, equality is at least in part what justice, or distributive justice, consists in. However, equality is by no means a simple ideal, and political theorists have grappled with the concept and how best to

develop an egalitarian theory. Indeed, the concept of equality has been at the forefront of political philosophy ever since John Rawls published his pioneering work, *A Theory of Justice*, in 1971. In this book, Rawls developed a very influential form of *liberal egalitarianism*—that is, a theory that combines a concern for liberty and a concern for equality.

Equality of What?

Any theory of equality must answer the question of what individuals (or groups of individuals) should have equal shares of. Whatever should be possessed equally is sometimes referred to as the *currency* of egalitarian justice. Often in the social sciences, research on inequality focuses on income, and economists have developed sophisticated measures of monetary inequality, including the Gini coefficient, which is a measure of how much income would have to be redistributed to achieve a perfectly equal monetary distribution (although, in fact, this measure can be used on other currencies as well). Likewise, political philosophers, including Rawls, have traditionally tended to focus on monetary equality, or equality of purchasing power. A main attraction of this idea, it is thought, is that while it in some respects puts individuals on an equal footing, it can simultaneously be used to hold them responsible for their choices. If people have equal initial purchasing power, then even if some end up with more money than others because they work longer hours, for example, or invest their money where others spend their time and resources on leisure, this resulting difference in income is not unfair because it is the result of choices people have voluntarily made.

However, even if people have equal external resources, in the form of equal purchasing power, they may at the same time have unequal internal resources, and thus unequal opportunities to use their time and money productively. For example, people have different levels of health and talent, which means that even from an initially equal monetary platform, they have unequal opportunities—for example, to acquire further income. Therefore, some egalitarian theorists suggest that, to compensate individuals with lower levels of health and/or talent, these individuals should receive extra resources in the initial distribution thereof. We will then have a distribution that is not only endowment insensitive because people are compensated for

deficiencies in health and talent that have resulted from their genetic make-up and/or social background, but also choice sensitive because people are required to bear the consequences of their own choices. This egalitarian principle is sometimes referred to as *equality of resources*.

Proponents of equality of resources believe that this principle has the further advantage that, unlike equality of welfare, it does not render society vulnerable to people's expensive tastes. *Equality of welfare* is the view that welfare (or quality of life) is the currency of egalitarian justice. Against this principle it has been argued that if some people have preferences that are much more costly to satisfy than other people do, then to equalize welfare, we would have to secure much higher incomes for those with expensive tastes than for others. Equality of resources, on the other hand, is not vulnerable to this objection, as it requires equality of purchasing power only.

However, welfare egalitarians have answered that this objection confuses what are in fact two different distinctions. If we do not believe that society should sponsor people's expensive tastes, this is because we believe that people are themselves responsible for developing these tastes. But we need to separate the question of whether we should sometimes hold people responsible for their share of advantages and the question of whether the correct measure of advantages in an egalitarian theory is resources or welfare. The first question concerns whether we should focus on equality of outcome or equality of opportunity, whereas the second question concerns what it is that we want people to either have equal shares of, or alternatively equal opportunities to acquire. Thus, some egalitarians argue that what justice requires is equality of opportunity for welfare, according to which individuals should only be compensated for deficiencies in welfare insofar as they are not themselves responsible for being worse off than others. On this basis, it may be argued that people who are worse off because they have cultivated expensive tastes do not have legitimate claims for compensation.

Whether we focus on resources or welfare, ideals of equality of opportunity need to distinguish between deficiencies for which people are responsible and deficiencies for which they are not. One way of thinking about this

distinction is the following. Sometimes shares of advantages are results of sheer luck. This is so if, for example, these shares are determined by the physical constitution with which we are born or by features of our initial social environment. Since no one chooses his or her genes or the social circumstances of his or her family, we cannot be said to be responsible for these aspects of our lives or for the advantages or disadvantages that flow from them. However, while we cannot be said to be responsible for our circumstances, we can be said to be responsible for at least some of the choices we make and more specifically, for the manner in which we administer our circumstances. This is the main idea behind the view commonly referred to as *luck egalitarianism*.

Obviously, the choice of welfare or resources as the basis of egalitarian justice, as well as the theory of responsibility one adopts, will make a difference for the implications of luck egalitarianism. For example, social scientists have discovered that working-class children tend to be bullied more in school than do children from higher socioeconomic classes. And while bullying is obviously detrimental to welfare, it need not affect levels of resources (although it may of course do so indirectly, insofar as it affects levels of achievement). Likewise, consider the claim made by some Sikh men for an exemption from the general requirement to wear a safety helmet on construction sites so that they can wear turbans instead. Can this claim be defended on the basis of an ideal of equality of opportunity? If there are other jobs available to Sikhs that are equally well paid, it is not clear that that their levels of resources are affected by the helmet requirement. Nevertheless, insofar as some of them have a preference for construction work, presumably their welfare will be affected. Furthermore, there is an issue of responsibility here: are Sikh men denied the opportunity to do construction work, or do they have the opportunity, but choose not to make use of it (for religious reasons)? Different accounts of responsibility will give different answers to this question.

The scope of Equality

A further question concerns the scope of equality, that is, the range of individuals and situations to which the ideal of equality applies. For example, does equality have global scope or a domestic scope only? Since

the largest inequalities obtain not within but between states, it makes a significant difference how this question is answered. Arguments for restricting the scope of equality to the domestic case usually take either a nationalist or a statist form—that is, they are based on either the significance of conationality or of comembership of a state. For example, some nationalists argue that our obligations of egalitarian justice extend only to our conationals simply because of the sort of relationship conationality is. Thus, they argue that just as parents have special obligations to their children simply because of the nature of the parent-child relationship, conationals have special obligations to each other in virtue of the nature of the relation of conationality. Alternatively—and more pragmatically—some nationalist egalitarians argue that the nation is the largest community within which people can mobilize the sort of solidarity that is required for implementing a large redistributive scheme, such as a scheme of egalitarian justice.

Global (or cosmopolitan) egalitarians, on the other hand, argue that the reasons that urge us to be egalitarians in the first place support global, not just domestic, equality. Consider again, for instance, luck egalitarianism. Being born into a family of poor, malnourished Ethiopian peasants is no less a matter of brute bad luck than, in the domestic case, being born into a family of unskilled, low-income, unsupportive workers. And so if what requires compensation is brute bad luck in the distribution of advantages, equality applies to the former case as well as to the latter. That is, equality has global scope.

Another question of scope concerns whether equality applies to all spheres in society in which advantages are distributed, or if it only applies to the most fundamental societal institutions that are responsible for this distribution, the so-called *basic structure*. The basic structure includes, among other things, the judicial, political, and economic system. While some theorists argue that the basic structure exhausts the extent of our egalitarian commitments, others—including some feminists—suggest that egalitarian concerns reach far into the private sphere and that, indeed, some of the most problematic forms of inequality, such as between men and women, obtain in spheres that are not appropriately covered by the basic structure.

A further scope-related question concerns the nature of egalitarian commitments between generations, including the question of whether we have egalitarian obligations to future generations. Clearly, this last question has important implications for the rate at which we are entitled to use up (nonrenewable) natural resources, as well as issues of pollution, including global warming. According to what is sometimes called *whole lives egalitarianism*, what matters is that individuals have equal lifetime sums of advantages. It does not in itself matter whether, at a particular point in time, individuals have equal shares, as long as they have equal lifetime shares. This view is at least compatible with the claim that equality applies between present and future generations, and some would say that it rather naturally implies it. But now consider *time-slice egalitarianism*. According to this view, what matters is that, at each point in time, individuals have equal shares. This view denies that equality applies across times or across generations that do not exist at the same time. Some egalitarians, however, have adopted a pluralist stance and claimed that both these temporal focuses matter.

The Value of Equality

What egalitarians value is a relation between individuals or more specifically, their shares of goods, namely the relation that consists in their having equal shares. However, some theorists have argued that this sort of relational value is troubling for the following reason. Suppose we bring about greater equality, not by improving the situation of the worse off, but by decreasing the level of the better off. In fact, suppose we bring about a perfectly equal distribution by placing everyone at the level of the very worst off. Egalitarians are then committed to the claim that we have improved things in at least one respect, namely regarding equality. But how can this new distribution be in any respect better when there is no one for whom it is better? Not even the worst off gain anything from the redistribution. This effect is the leveling down objection to egalitarianism.

Some egalitarians are quite prepared to live with this implication of egalitarianism. They point out that they are not committed to the claim that leveling down is better, all things considered. After all, egalitarians may

endorse other values besides equality, such as efficiency, in virtue of which leveling down may be a bad idea.

However, some theorists who are otherwise inclined toward egalitarianism find even the claim that leveling down is in one respect better troubling. They, therefore, look to other principles that favor the worse off, such as leximin, prioritarianism, or sufficientarianism. According to leximin, one distribution is better than another if the worst off individual in the former distribution is better off than the worst off individual in the latter distribution (and in case these are equally well off, if the second worst off individual in the former distribution is better off than the second worst off individual in the latter, etc.).

According to prioritarianism, however, this sort of absolute priority to the very worst off is excessive. Rather, we should gradually assign less weight to benefits to individuals, the better off they are. This means that everything else being equal, it is better if a benefit of a fixed size goes to a worse-off than to a better-off individual. But if the benefit to the former individual is sufficiently large compared to the benefit to the latter, the former benefit may nevertheless outweigh the latter.

Finally, according to sufficientarianism, benefits to the worse off are morally more important than benefits to the better off (as in prioritarianism), but there is a threshold at which priority to the worse off sets out. That is, there is some level of benefits such that, above this level, being worse off than others does not entitle an individual to priority. For example, the rich should not have priority over the super rich. Unlike egalitarianism, these three principles are not vulnerable to the leveling down objection, and so may offer alternatives for those who are attracted to redistribution to favor the worse off, but are troubled by this objection.

Ethnicity and Political Thought

It is striking, and very relevant, that the term *ethnicity* does not actually appear in English dictionaries until the 1950s. Its linguistic origin, the Greek noun *ethnos*, has no English equivalent, generally being rendered into “ethnic group” or substituted, sometimes in academic discussions, with the French term *ethnie*. The earliest recorded usages of *ethnos* in Ancient Greece did not refer to groups of people sharing culture or descent, but denoted, as in the case of Aristotle’s employment of the term, foreign or barbarous peoples. In this context, *ethnos* connoted primitiveness and nonlegitimate social organization, in brief, the Other. In this sense, it was also a moral term, similar to *goyim* in Hebrew or *gentiles* in English that indicated exclusion, disdain, and strangeness. In its ancient usage, ethnicity was typically a code of difference applied to others rather than something that was used for self-representation. The Romans, for example, used the related term *nation* for distant, barbarian peoples and *populus* for their own community. Only since the mid-nineteenth century has the term *ethnic* acquired its meaning of denoting membership of a group of people with shared characteristics, including at minimum common descent, or perhaps more to the point a belief in a common descent. As a working definition, *ethnies* exhibit, albeit in varying degrees, six main characteristics: a common proper name, a myth of common ancestry, some body of shared historical memories, one or more elements of common culture, a link with a territorial homeland, and a sense of solidarity that is strong enough to underpin and influence social and political action.

A significant difficulty in dealing with the relationship between ethnicity and political thought is that a conceptual imprecision on the nature of ethnicity has always been a consistent feature of the study of the phenomenon. This imprecision also reflects the difficulties inherent in attempting to quantify ethnic affiliation and commonality. One of the few modern political thinkers to directly address the concept of ethnicity was Max Weber, who claimed in Chapter 5 of *Economy and Society: An Outline of Interpretive Sociology* that the concept “dissolves if we define our terms exactly.” In his discussion of ethnicity as a type of status group, he argued for the importance of subjective belief in common descent and other cultural similarities, in recognizing the phenomenon, and that the most relevant significance of ethnic commonality was its utility for political organization and cohesion. Except for Weber and a few others notwithstanding, ethnicity did not attract significant academic attention until after 1945. The conceptual history of ethnicity has, fundamentally, been dominated by disagreements between the positions of primordialism and constructivism. The former view emphasizes the nature of ethnic affiliation among its participants as an externally given, objective social bond. Primordialist positions also assume, in addition to this really existing status of ethnicity as constitutive and permanent, that it possesses a history dateable back to time immemorial. The constructivist approach has also been described as instrumentalist in that it conceives of the importance of ethnicity as an element of political strategy, a resource for interest groups for aiming to achieve goals such as, for example, the increase of wealth, power, or status. Constructivism, therefore, places emphasis on the artificiality of ethnicity, its fundamentally modern nature, and on nation-formation being a cause of ethnic affiliation rather than an outcome of the same. Etienne Balibar (1991) applied the term *fictive ethnicity* to “the community instituted by the nation-state.” Ethnic identities are regarded as invented or imagined, even if certain criteria of such identities are in some way provable or demonstrable. Ernest Gellner contended that, in brief, such ethnic or communal identities that underpin nationalism are essentially a result of the historical processes underpinning the formation of nation-states rather than a cause or necessary condition. In reality, most modern scholars are constructivists to one degree or another. Even within the ethno-symbolism position advanced by Anthony D. Smith and others who seek to stress the importance of ethnicity, the fundamental importance of

historically contingent symbols, myths, values, and traditions in the expansion of any sense of ethnic identity is accepted. On the other hand, some scholars believe that this position still (wrongly) accepts ethnicity as an objective concept, giving too much credence to essentializing primordialism. Some constructivists, such as Rogers Brubaker (2004), have asserted for the need to conceive of ethnicity without groups, that is, as a form of cognition and action.

Significance, Historical and Contemporary

While the concept and study of ethnicity and its relationship to politics are distinctively modern, distinctions based on ethnotypes, as said above, can be found in works of political thought going all the way back to the ancients, for example to Aristotle. The Renaissance saw the dawn of a new interest in ethnic cultures in some parts of Europe, for example, in the German lands of the Holy Roman Empire (here the rediscovery of the classical text the *Germania* of Tacitus was of special importance). The work of Montesquieu, David Hume, and other Enlightenment thinkers more generally also supposed the relevance of what may be regarded ethnic divisions for political and ethical thought. Yet ethnicity as a first principle in political thought is inextricably linked with nationalism since its late eighteenth century beginnings. German Romantic philosophy, particularly in the context of a rejection of French political and cultural supremacy in the former Holy Roman Empire, was fundamentally important to the modern linking of ethnicity with political thought. The foundational text of modern nationalism, Johann Gottlieb Fichte's *Reden an die deutsche Nation* ([1808] 1978) conceived of the political community not as a social contract arising out of some conjectural state of nature, but as a moral and transgenerational community based on certain immutable characteristics, such as—most fundamentally in Fichte's case—language, the true expression of the psyche of a given people and therefore of incalculable significance. The increased prevalence of discourses of race in the middle and later nineteenth century, for example in the work of the French theorist Joseph-Arthur de Gobineau in his *Essay on the Origins of Human Inequality* and later in the circulation of Social Darwinist ideas, also draws attention to the heightened importance of ethnicity to political thought as the nineteenth century progressed. Socialist thinkers of the nineteenth

century also dealt with what we would now call questions of ethnicity and its significance to political thought, including Karl Marx and Friedrich Engels.

Notwithstanding the close association of ethnicity with nationalism in terms of the former's significance to modern political thought—given the centrality of the assumption of natural kinship as the most natural and optimal form of human association as the basis of nationalist politics—the concept has had great importance for other political traditions as well. Twentieth-century socialism, in its many manifestations, has given a considerable deal of attention to ethnicity, as has liberalism, insofar as ethnic distinctions and categorization continue to be a problem for the development of pluralistic societies. Ethnicity has also been, of course, at the center of contemporary debates in Europe and in North America over the merits of multiculturalism or assimilation. There is a certain irony in the reality that, despite the importance of ethnicity to nationalists, ethnic categorizations, distinctions, and affiliations have been a force for serious, even catastrophic instability and violence within nation-states, including within Europe in recent times (e.g., Northern Ireland and the Balkans). While there is no necessary connection between ethnicity and conflict, as Donald Horowitz (1985) suggests, the basis for intrastate conflict often exists in the inclusion of two or more different ethnic communities within one state. With the appearance of the modern bureaucratic and national state, ethnic communities assumed a new political importance. The ideological precepts and practices of nationalism demanded homogeneity. Efforts to produce this inevitably resulted in conflicts since most states, were, after all, in practice rarely monoethnic. In the non-Western, colonial, and postcolonial world, ethnicity has exercised an especially and often extremely malignant significance in politics. As Clifford Geertz puts it in *Old Societies and New States* (1963), “The new states are abnormally susceptible to serious disaffection based on primordial attachments” (110–11). Imperial powers delineated the boundaries of their non-European possessions without much regard for indigenous ethnic boundaries while at the same time encouraging ethnic classifications of populations and requiring some ethnic communities to play special roles, for example, as local elites or colonial military forces. This practice was part of the background of the animosity between Tutsi and Hutu communities in

(formerly Belgian-ruled) Rwanda that resulted in the genocide of 1994. It is unsurprising, therefore, that some scholars, such as Walker Connor (1994), have consistently stressed the importance of the nonand even antirational characteristics of ethnic affiliations. Even in advanced democracies, ethnic typing has played a role until very recently, for example, in the United States, where legalized ethnic and racial discrimination was the norm in much of the country until the 1970s. Ultimately, ethnicity will continue to play a role in politics throughout the world for as long as ethnic distinctions are commonly accepted, and there is no sign of such notions being abandoned any time soon.

Fabianism

Fabian socialism can be defined in three important and distinctive ways; first, as a relatively homogenous set of socialist arguments developed by a small group of British and Irish intellectuals in London in the 1880s; second, as the whole range of political doctrines (social democratic as well as strictly socialist) developed under the banner of the Fabian Society from its foundation in 1884 until the present day; and third, as a more specifically anti-Marxist form of socialism current during the same period. This entry emphasizes the first and third definitions, although it will also take some time to consider the middle and late twentieth-century developments that succeeded classical Fabianism.

Classical Fabianism, 1884–1918

The Fabian Society was originally founded in January 1884 by a small group of disaffected members of an ethical debating society called The Fellowship of the New Life. The new group, led by Edward Pease, Frank Podmore, and Hubert Bland, wanted to emphasize the evolutionary, political reform of the competitive system (as opposed to the personal moral reform stressed by the Fellowship) and took a name inspired by the attritional tactics of the ancient Roman general, Fabius Cunctator. The Society was never a political party, but it soon recruited many independently minded radicals such as George Bernard Shaw, Sidney Webb (and later his wife Beatrice), Annie Besant, Graham Wallas, Sydney

Olivier, and William Clarke. Through a series of short pamphlets known as “Fabian Tracts” and an important collection of articles called *Fabian Essays in Socialism* ([1889] 1967), the society disseminated a moderate, reformist ideology that some members even believed could be implemented by working through the Liberal Party (permeation) although others favored the foundation of a separate socialist or labor party to achieve their goals. In the 1890s, a network of regional Fabian societies was established outside London and became an important component of the broader labor movement.

A central argument of classical Fabian socialism was that the unjustly high incomes of capitalists, landlords, and professionals were best understood as Ricardian rents rather than as the forms of surplus value postulated by Karl Marx. Armed with this insight, the leading London Fabians deduced that a combination of progressive taxation, redistributive public expenditure, and the gradual nationalization of key industries was the best strategy for eliminating poverty in Britain, while they also proposed extensive reform of the political system to create universal suffrage and remove the legislative veto of the aristocracy. The Fabians believed that many nonsocialists could be persuaded to support individual measures from their program and that these incremental changes would eventually add up to a qualitative change from a competitive to a socialist system. Hence, Fabian programs advocated many short-term measures to improve the lot of the working class, such as the extension of factory regulation, substantial improvements to the education system, and the reorganization of poverty relief in order to provide a safety net for the sick, the aged, and the unemployed. Although one of the main principles of classical Fabianism was the organization of public services by local government (municipal socialism), the fact that its supporters also advocated national legislation and national standards as the means of achieving their egalitarian goals created a certain tension between centralizing and decentralizing strands within the ideology. Moreover, the pragmatic argument that state socialism was more efficient than free-market capitalism often seemed to crowd out the original egalitarian reasoning of the *Fabian Essays*, and some prominent figures, such as Shaw and the Webbs, even flirted with eugenics, although this was never endorsed by the Society as a whole.

Classical Fabianism was nothing if not eclectic, and its arguments drew upon many nonsocialist thinkers, such as Auguste Comte, Herbert Spencer, John Ruskin, Jeremy Bentham, John Stuart Mill, David Ricardo, William Stanley Jevons, and Henry George for inspiration, as well as earlier socialists such as Robert Owen, Louis Blanc, and Ferdinand Lassalle. The Society was generally hostile to self-styled revolutionary Marxist groups—such as the Social Democratic Federation, a precursor of the British Communist Party—but a strand of argument that justified reformist socialism using Marxian categories such as class and the economic foundation (which might be termed reform-Marxist) always existed within in the Society and can certainly be found in the work of Bland, Clarke, and other Fabians. This sociological Marxism was no litmus test of practical politics, however, and while Clarke left the Society before the Second Boer War, partly because he felt it had not taken a strong line against imperialism, Bland accepted the majority view that the British Empire was a large and efficient unit within which major social reform could be achieved and that it should be democratized rather than dismantled. The outbreak of hostilities in South Africa in 1899 led a number of other anti-imperialists to leave the Society, and for several years afterward its influence waned.

One notable initiative to revive the Society and turn it into a more partisan organization was sponsored by the novelist Herbert George (H. G.) Wells in 1905, although the main upshot of his activities was to disseminate Fabian ideas among a younger generation of artists than had been reached by Shaw's plays. Later, during the famous suffragette campaign for women's electoral rights, a Fabian Women's Group, founded in 1908 by Charlotte Wilson, Maud Pember Reeves, and many others, developed a more social feminism that debated issues such as child labor, improvements in educational, medical and nursery provision, family poverty, and the idea of family allowances. However, a further split among the Fabians occurred in 1915 during World War I when a group of younger members, led by George Douglas Howard (G. D. H.) Cole, finally left the Society—under the banner of Guild Socialism—arguing that traditional Fabianism was too bureaucratic and centralizing, a liberal critique that, nevertheless, kept its followers firmly within the broad labor movement.

Fabianism, Marxism, and Revisionism

The Fabian tendency to reject Marx completely, rather than interpret his doctrine in a moderate, evolutionary manner, was to some extent opportunistic and rooted in the politics of London in the mid-1880s. During an economic recession, a small, vocal minority of intellectuals and working-class activists were able to create small but relatively stable organizations and recruit sizeable demonstrations against unemployment and Britain's colonial policies in Ireland, a phenomenon often referred to as the English socialist revival. These demonstrations were firmly repressed by the Victorian state (there were even a couple of fatalities), and the Fabians concluded that it was vital to persuade the London radical societies to repudiate both the Social Democratic Federation and the more libertarian Socialist League, led by William Morris. With this in mind, and without being Germanophobe, the Fabians argued for a socialism that paid homage to figures who were already popular with politically informed members of the London working class and emphasized the socialist dimension of the Anglophone radicalism of Mill and George—the former being well-remembered from the 1860s and 1870s, the latter having made a popular visit to England to campaign for land reform in 1881 and 1882.

Having said all that, a sophisticated theoretical debate about the relative merits of Marxist and neoclassical economics was conducted in the pages of a left-wing journal called *Today* and at meetings of a group closely associated with the Fabians, the Hampstead Historic Club, before the Fabian leadership turned conclusively against Marxian economics. Subsequently, despite the reform-Marxist strand noted earlier, the dominant strand in Fabian rhetoric assumed that it was sufficient to expose the monopolistic aspects of capital without specifying a detailed mechanism of economic exploitation (the rent argument being a very general point about distribution), while the Marxian theory of trade cycles and crises was generally ignored, presumably because it gave too much comfort to those socialists who still held to an insurrectionary-revolutionary agenda. The same dispute was current in most other industrial countries in the late-nineteenth century, and the famous German reformist-revisionist socialist Eduard Bernstein was actually living in exile in London from 1880 to 1901 and drew considerable inspiration from Fabian discourse. However, the

Fabian definition of socialism (the “Fabian Basis” of 1887) was sufficiently general for some revolutionaries and many Liberals to remain members, if not leaders, of the Society for many years.

Interwar Fabianism, 1919 to 1939

Although the Fabian Society had been affiliated to the Labour Representation Committee (later the Labour Party) since its foundation in 1900, it was during the interwar period that it effectively severed its residual links to the Liberal Party, as Labour became a party of (minority) government in 1924 and 1929. Consequently, the Society became the think tank of the Right and Centre of Labour, with normative debates that reflected the ethical-pragmatic dichotomy and the sociological debates between positivists, organicists, and reform-Marxists, continuing to rage behind a policy-oriented discourse. In the latter part of the period, there was a limited turn to the left, for reasons that should become clear shortly.

As one might expect, Shaw, the Webbs, and other members of the Fabian old guard continued to exercise a degree of influence upon the Society, but a new wave of Fabian academics—not only Cole, but also the ethical socialist Richard Henry (R. H.) Tawney and the reform-Marxist Harold Laski—were increasingly important. The first Labour prime minister, James Ramsay MacDonald, was sympathetic to Fabian ideas, having been an active member from 1886 to 1900, but he had left over the Boer War controversy and never returned. Instead, the Society continued to try to shape public opinion through its tracts, through the independent writings of its members, and through *The New Statesman* magazine owned by the Webbs. Moreover, although the interwar Society as an organization was reluctant to endorse full decolonization, the Fabian outlook was taken up by many foreign students who subsequently became Third World leaders, including Jawaharlal Nehru (India) and Mohammed Ali Jinnah (Pakistan).

The debate between the Fabians and the Guild Socialists continued after World War I, as the latter group fleshed out many of their proposals for workers’ self-management and functional democracy for both producers and consumers. However, there was a gradual rapprochement between the two currents, and *A Constitution for the Socialist Commonwealth of Great*

Britain by Sidney and Beatrice Webb, published in 1920, integrated many Guild ideas into the more traditional ideal of a municipally oriented, collectivist federation. In 1931, Cole and his wife, Margaret, founded the New Fabian Research Bureau to develop detailed schemes of industrial democracy, and other policies, for the labor movement, and this group finally merged with the main Society in 1938.

Other strands of socialist thinking also remained important within the Society. As Tawney's common designation as an ethical socialist implies, he was more concerned to establish equality of human worth as a value judgment and expose the fallacies of consumer capitalism, before tailoring reformist public policies, such as limited nationalization of industry and moderate redistribution of wealth, to take account of this judgment. Like the Webbs before him, he did not expect public opinion to be won over to socialism in one fell swoop and held that incremental reform must proceed in step with broader cultural attitudes. Laski, on the other hand, was more sympathetic to Marxism, more concerned about the dangers of fascism, and more willing to countenance conflict between Labour and the establishment, although he was not unsympathetic to the classical Fabian agenda: for example, in 1935 he edited a volume of essays titled *A Century of Municipal Progress*.

Fabianism in War and Peace, 1940–2000

The disappointments associated with the collapse of the second MacDonald government eventually set in train a mood of labor movement reconciliation indicated by the Fabian merger of 1938 mentioned above. During World War II, the Society played its part in forging a national policy consensus, acting as a welfare state think tank, and developing specifically Labourite policies based on the principles set forward by the Liberal academic William Beveridge in his 1942 *Report on Social Insurance and Allied Services*. (Beveridge collaborated with the Society in its 1943 publication *Plan for Britain*.) Moreover, this tendency to reconcile political differences survived into the period 1945 to 1951, perhaps partly out of loyalty to the second Labour prime minister, Clement Attlee, who had been an active Fabian and advocate of municipal socialism between the wars.

Although tensions between the left and right of Labour began to emerge after the electoral defeat of 1951, a new and inclusive manifesto-style publication, *New Fabian Essays*, was published in 1952, edited by Richard Crossman. Crossman was a leading figure in the Keep Left group, but the volume, while less intellectually impressive than its predecessor, contained chapters written from all wings of the party, including some by future leaders of the revisionist “Campaign for Democratic Socialism” such as Anthony Crosland. Crosland’s ideas have often been retrospectively labeled Fabian, but at the time, when he published *The Future of Socialism* (1956) and afterward, he emphasized the fact that his limited-state socialism was less bureaucratic than that advocated by the Webbs and tried to distance himself from the society, while remaining a member. Furthermore, Crosland’s arguments for a plurality of methods and social goals (education and decentralization, community and equality of opportunity, as well as purely material equality), as opposed to earlier nostrums such as regulation, planning, and nationalization, were not only important in explaining the feud between the two leading Labour personalities of the day—Aneurin Bevan and Crosland’s ally, Hugh Gaitskell—but for later developments too.

From the 1960s to the early 1990s, the Society acted as a networking and policy discussion group for the Labour Party as a whole and remained committed to the Party even when a significant minority of right-wing members of Parliament established a short-lived, breakaway center grouping (the Social Democratic Party, 1981 to 1990) after the election of Margaret Thatcher as prime minister in 1979. However, during the 1990s, the society again became associated with a particular political position, namely the Blairite, or New Labour, viewpoint. Anthony (Tony) Blair, Gordon Brown (both later prime ministers), and Edward Balls were all involved in developing a variety of economic and social policies that owed much to the pluralistic, social market analysis that Crosland had proposed forty years earlier. While the Fabian Society did not enjoy exclusive copyright on these developments, it was certainly near the heart of a sea change in Labour politics. If the original Fabian synthesis gave far more weight to collectivism than to individualism, contemporary Fabianism has virtually reversed this polarity while still speaking the language of the common good.

Fanon, Frantz

Frantz Fanon is probably the most well-known activist and theorist of the anticolonial independence movements of the post–World War II period. His ideas on colonialism, antiblack racism, and the struggle for freedom have had a huge influence around the world and have been central to theories of violence and postcolonialism.

Fanon was born on the Caribbean island of Martinique in 1925 to middle-class parents. At the time of Fanon's childhood and adolescence, Martinique was a colony of France, but its status was changed in 1946 when it became one of the French Overseas Departments. Fanon was educated at the prestigious Lycée Schoelcher where he was taught by the poet Aimé Césaire, one of the founders of the negritude movement, which aimed to reappraise black culture in a positive light. Fanon was deeply indebted to Césaire throughout his life but disagreed with the ideas of negritude as a way of challenging racism. During World War II, Fanon joined the Free French Forces and fought against fascism in Morocco, Algeria, and France where he received the Croix de Guerre medal in 1944. After a brief return to Martinique after the war, where he obtained his baccalaureate, he went back to France in 1946 to study medicine and psychiatry in Lyon.

During this time, Fanon's engagement with the theories of Hegelianism, phenomenology, existentialism, and psychoanalysis, coupled with his increasing awareness of French metropolitan racism, led to the writing and

publication of his first book *Black Skin, White Masks* ([1952] 1967). In this book, Fanon employs an eclectic range of theory to show how colonialism alienates the colonized from their sense of self. He is particularly influenced by the concepts employed by the French philosopher Jean-Paul Sartre in his analysis of anti-Semitism in his book *Anti-Semite and Jew* ([1946] 1995). Fanon adopts Sartre's understanding of the way in which the Jew is defined negatively by the racist gaze of the anti-Semite and transfers it to the colonial situation. He describes an incident on a train in France when a young white boy, on seeing the black Fanon, says to his mother "Mummy, look at the Negro! I'm frightened." This moment dramatizes the process by which blackness is objectified and demonized in a white world. The imposition of this white mask on the black skin operates unconsciously to produce fear and anxiety on the part of the white boy (Negrophobia) and a shattering of the sense of self on the part of the black man as he sees himself, and especially his own body, through the phobic gaze of the other.

In *Black Skin, White Masks*, Fanon takes Western theory and shows its limitations when applied to the colonial context. Despite adopting Sartre's model of racism and alienation, he demonstrates how Sartre's existential version of being devalues blackness; he borrows from Freud but says that psychoanalysis cannot be applied uncritically to the Caribbean; he reappraises Georg Wilhelm Friedrich Hegel's master-slave dialectic and his theory of recognition to show how they are founded on a Western understanding of the workings of history. The book can be read as a dramatization of the clash between two conflicting aspects of Fanon's upbringing: the Western intellectual tradition of defining the human central to his education and the lived experience of a young black man in a situation of colonial rule. The text often goes off on tangents, and its exploration of sexual desire frequently betrays Fanon's own patriarchal assumptions. However, it is a fascinating exploration—through a strange blend of literary, psychoanalytic, philosophical, and sociological analysis—of the ways in which colonialism not only exploits people economically but through its imposition of a racialized ideology, alienates them in cultural, psychical, and somatic ways as well and distorts their most profound desires and fears. Only through understanding the unconscious ways in which colonialism dehumanizes its victims can the colonized hope to find true freedom and authenticity.

It was not until he had qualified as a psychiatrist in 1953 and after a brief spell in Normandy, had taken up a post at the Blida-Joinville psychiatric hospital in Algeria that Fanon's ideas on colonialism and liberation became more radical. The Algerian war of independence started in 1954, and Fanon became increasingly aware of the effects of colonialism on the economic and social structures of the country and on the psychic lives of ordinary Algerians. The disorders of his patients, he concluded, were not simply clinical but due, in large part, to colonial oppression. Hence, clinical remedies were no solution to the problem; only liberation from colonial oppression could reintegrate damaged selves and reinvent exploited nations. He consequently resigned his post in Blida in 1956, explaining in his famous "Letter to the Resident Minister" the reasons for his refusal to work for a state that had reduced the status of Algeria to that of "absolute depersonalization" and "systematic dehumanization." By this time, Fanon had already joined the Algerian National Liberation Front (FLN), the revolutionary movement struggling for independence from French colonial rule, and started writing for its newspaper *El Moudjahid* (The Warrior). Following his resignation from his post in Blida, he was expelled from Algeria and went to Tunis where he continued to work as a psychiatrist and also became an editor for *El Moudjahid*. Using the example of the Algerian uprising as his permanent model, he now committed himself to the political struggle to rid the Third World of its Western masters.

Many of Fanon's writings of these years, including his letter of resignation from Blida, were collected after his death and published posthumously as *Toward the African Revolution* ([1964] 1970). However, his two other books, *A Dying Colonialism* ([1959] 1970) and *The Wretched of the Earth* ([1961] 1966) constitute his major works outlining a revolutionary program for liberation. In *A Dying Colonialism*, Fanon explores different aspects of the Algerian situation to demonstrate how a revolutionary national consciousness must be constructed as a necessary precursor for the struggle for national liberation. In his essay on the veil, Fanon shows how the European fantasy to remove the head covering from the Algerian woman and discover her secret (a sexualized metaphor for the rape of the country as a whole) is challenged by the refusal of the Algerian woman to reveal herself to the occupier. This refusal constitutes a significant act of resistance and helps to develop a revolutionary consciousness for the war of

independence from colonial rule. (For a cinematic portrayal of this process, see Gillo Pontecorvo's *The Battle of Algiers*, 1965.) Fanon's analysis of the Algerian woman's subversion of the controlling gaze of the European man recalls his advocacy of a subversion of the colonial objectification of the black body in *Black Skin, White Masks*. In the other essays in *A Dying Colonialism*, Fanon shows how other features of Algerian society under colonial rule—the radio, the Algerian family, the imposition of Western medical science, and the presence of Algeria's European minority—must similarly be challenged and transformed from tools of colonial propaganda, control, and oppression to a means of forging a historical consciousness of liberation and the unification of subjected peoples. Demystification, deobjectification, transformation, and reappropriation are a fundamental part of what Fanon terms the *historical dynamism* of the struggle for independence.

The Wretched of the Earth, probably Fanon's most famous text, became the manifesto for revolutionary struggle against colonialism in the period of postwar decolonization. At the beginning of the 1960s, the Algerian war of independence had entered its critical stage, and Fanon had by now adopted an uncompromising position. In the book, he argues that because colonialism has constructed a Manichaeian racialized order founded on violence—dividing the settler irrevocably from the native—it can only be defeated through a reverse Manichaeism that will itself be founded on violence. In his preface to the book, Sartre calls this, “The moment of the boomerang” when the colonized wreak their revenge. As Fanon says, the end of colonialism will “only come to pass after a murderous and decisive struggle between the two protagonists.” He conceives of violence as a cleansing force in this struggle that will destroy the two zones created by colonialism and prepare the people for a new start (a *tabula rasa*).

However, although the text became known especially for its advocacy of violent revolution, in fact the major part of it deals not with violence, but the dangers to avoid for any independence movement to ensure the successful development of a national consciousness and creation of a unified people. Fanon warns against the rise of a new national bourgeoisie that would simply re-form the colonial order instead of removing it. He explains how the Cold War between the Soviet Union and the West diverts

attention from the real struggle for independence for colonized peoples. He explains how old hostilities between traditional religious communities and the more modern secular aspirations of city-dwellers threaten the unity essential for a successful movement of liberation. He proclaims that the construction of a national consciousness must be founded on the consciousness of social and political needs, hence allying socialist and nationalist principles in the movement for independence. He uses his scientific training to demonstrate, once again, how neuroses are often a consequence of colonial oppression, hence historically rather than biologically determined. Finally (and most prophetically, as we can see with hindsight), he warns against the cult of the leader that will derail the will of the collectivity.

Like previous works, *The Wretched of the Earth* makes use of different Western theories and transforms them in order to propose a radical program for national liberation and the creation of a new “Man.” Fanon engages once more with Hegel’s notion of the unfolding of history to demonstrate how this theory is conceived in western terms and must be reformulated to take account of the historical dynamism of non-Western peoples. Similarly, he explains how, in the colonial context, it is race rather than class that is the main cause of the compartmentalization of spaces so that Marxist analysis must be stretched to understand inequality in colonized lands. Sartre’s theories of being and authenticity are again reappraised through the eyes of the colonized, while previous challenges to Western universalism—the foremost of which is the negritude movement—are dismissed as proposing essentialist myths about black culture (“a national culture is not a folklore,” as Fanon says) which do little to eradicate the source of oppression itself. Yet Fanon’s ideas are sometimes contradictory and his views on the new humanity to emerge from the failed Western version frequently seem to be founded on blind faith rather than a coherent program for revolution.

The Wretched of the Earth is the culmination of Fanon’s ideas on liberation for colonized peoples that he had expressed in numerous articles in previous years and disseminated in his role as ambassador to Ghana in Accra in 1960 (on behalf of the provisional government of Algeria before independence) and as roving ambassador in other Third World countries for pan-African

unity (see for example, “This Africa to Come” in *Toward the African Revolution*). Fanon wrote the book during a period of remission from the leukemia that he had contracted in 1960. He died in December 1961 in the United States at the age of thirty-six, shortly after the completion of *The Wretched of the Earth* and only a few months before Algeria gained its independence from France. According to his dying wish, he was buried in Algeria six days after his death.

Fanon’s ideas have had a far greater influence after his death than they ever had during his lifetime. During the 1960s, Fanon’s message of violent revolution struck a chord with other anti-imperialist liberation movements of the time, although his influence in Africa was not as extensive as it proved to be in the United States where he acquired cult status for black activists in the Black Power movement. Since the 1980s, with the development of cultural studies and postcolonial theory in American and British universities, Fanon has been invoked as one of the most significant anti-imperialist thinkers of our time (although he has had very little recognition in France). Interestingly, it is not so much Fanon the theorist of violent revolution who is championed today as Fanon the theorist of racial ideology. Hence, *The Wretched of the Earth* has been gradually replaced as the seminal work by *Black Skin, White Masks* as the perspective on Fanon has steadily shifted from the political theorist to the cultural analyst.

A balanced view of Fanon would consider both perspectives as, for Fanon himself, they are profoundly interconnected. Decisive political action leading to liberation from oppression can only follow from analysis of the complex ways in which racialized colonial ideology inhabits popular culture and penetrates the unconscious of every individual (see for example “Racism and Culture” in *Toward the African Revolution*). Fanon was one of the first theorists of what we might call the decolonization of the mind (a process that is far from completion today). He was also one of the first to explore the tangled relationships between race, gender, sexual desire, and power. In a more general sense, Fanon’s life and work mark a watershed in modern history: the limitations of the Western project of civilization, progress, and humanity are cruelly exposed when measured against the violent and dehumanizing history of colonialism. Fanon announces the backlash against Western hubris and the rise of new voices in the postwar

period. His theories were sometimes confused, his obsession with the effects of colonial history all-consuming, and his version of liberation politics extreme. Yet no matter how utopian it seems, his dream of a new humanity, freed from the divisions of racial stereotyping, remains an inspiring vision for the postcolonial world.

Fascism

Fascism now refers in most serious political science and historiographical usage to a revolutionary form of antiliberal nationalism that in its fanatical pursuit of national rebirth in the 1930s and 1940s, particularly in Germany, played a decisive role in causing the Spanish Civil War and World War II in Europe, and the resulting loss of many millions of military and civilian lives through war, persecution, forced labor, and genocide. As an ideology of total societal transformation, which inevitably becomes a totalitarian politico-military project when translated into practice, it arose out of the powerful growth of ultranationalism in nineteenth century Europe, but emerged fully as a discrete political force in many countries within the Europeanized world only in the aftermath of World War I. It was the devastation caused by this war; the ensuing socioeconomic distress, combined with the collapse of four absolutist empires; and the Bolshevik Revolution in Russia and rise of communism elsewhere that had seriously undermined confidence in the liberal vision of progress even within the victorious liberal states. It has become conventional for generic fascism to be spelled with a lower-case *f* to distinguish it from Italian Fascism and for its postwar manifestations to be referred to as *neofascism*.

Particularly in the interwar period, fascism envisioned the imminent realization of a radical, modern, totalitarian alternative to absolutism, liberalism, communism, and military or conservative authoritarianism. It was to be based on the enhanced power of an organically conceived nation, people, or race. By extension, the term also denotes the regimes, mass

movements, paramilitary elites, or activist vanguards bent on realizing this project, as well as the violence, policies, measures, rituals, propaganda, publicism (which in the case of contemporary neofascism includes a vast number of websites), attitudes, behaviors, and mind-sets associated with the ruthless implementation of an ideology of total ethnic or racial rebirth, whether within a particular country, in Europe, or in the West as a whole. The paradox of a supranational fascism is to be explained by the fact that, in contrast to communism in theory (for in practice communism has always manifested itself in combination with extreme nationalism), fascism, though intensely ethnocentric and ultranationalist, can lend itself to internationalism by regarding particular bids to regenerate the nation, race, or regional culture (ethnopluralism) as local manifestations of an epochal, history-making struggle against the common enemies (e.g., communism, materialism, Judaism, Islamism, multiculturalism, Western decadence). Attempts to found a fascist international in the interwar period foundered, but this aspect of fascist thought has become much more prominent since 1945 in such phenomena as Universal Nazism and Eurofascism.

Fascists typically see themselves as engaged in a heroic, history-transforming struggle to combat the forces of societal, ethnic, or civilizational decay (sometimes imagined in overtly racial and biological terms) through the attempted regeneration (palingenesis) of the whole national body politic. It is a program that necessitates a fundamental overhaul, not just of the nation's key institutional structures, but of its sociopolitical culture, demographic strength, and anthropological resources, thereby bringing about its renewed physical and moral health, the ultimate test for which was assumed by fascists to be its strength as a modern, military, imperial, and cultural power. However, especially in the initial phase of regime building, this positive utopian goal typically manifests itself destructively in systemic violence and hostile propaganda directed at the alleged carriers of degeneracy, such as trade unions, socialists, communists, liberal humanists, ethnic minorities, especially Jews and gypsies, homosexuals, decadent artists, the incurably insane, immigrants and their descendants, and foreign religions, though the human categories identified as enemies of the proposed reborn nation or new order vary markedly from case to case.

The idealistic revolutionary thrust of fascism in the interwar period was further obscured to its opponents, especially on the left, by its readiness to collaborate on pragmatic grounds with conservative institutions (the church, monarchy, the conservative right, the bourgeoisie, the army, and big business), which compromised its emergence as a fully autonomous state that had conspicuously and definitively broken with the old order. Fascism's futural dynamic can also appear paradoxical given its frequent evocation of an idealized heroic past and celebration of the apparently regressive values of belonging, blood, and soil in the bid to establish the mythic foundations and roots of the new state and ethnic community. This new order is nevertheless conceived by its most ardent protagonists as an alternative modernity that promises to overcome the dangers posed by materialism, atomization, individualism, liberalism, cosmopolitanism, and internationalist communism.

Fascist Thought

Given the unique genesis of each variant of fascism, and its stress on the primacy of action and heroism over theory and the intellect, it is problematic to characterize fascist thought beyond indicating some general traits or tendencies. Every national variant and each of the many strands within each variant is rationalized through unique syntheses of ideas that have a particular resonance within the particular historical and political culture in which the movement arises. While there is no shortage of ideologues articulating a fascist worldview, some of them elaborated in a sophisticated theoretical and academic discourse, there is no fascist equivalent of the role played by Edmund Burke, John Stuart Mill, Karl Marx, Michael Bakunin, or Vladimir Illyich Lenin for other political ideologies. However, there are a number of recurrent traits or syndromes in fascist thought. One such syndrome is the combination of vitalism, voluntarism, and cult of mythopoeia as positive forces for the active making of history rather than its passive understanding, themes that locate it within the modern phase of the anti-Enlightenment tradition also represented by such antipositivist thinkers as Friedrich Nietzsche, Georges Sorel, and Martin Heidegger.

Consistent with this trait of fascist ideology is what has been termed a *Gnostic* concept of knowledge that sees it not in rationalist empirical terms, but as an action-oriented, corporeal source of identity and historic mission, combined with a reading of the present civilization that is Manichaeian, identifying segments of society or humanity to be suppressed, removed, or exterminated in order for the national community (and in the vision of some fascists Western civilization as a whole) to be reborn. The experience of contemporary history as a battleground between opposing forces of regeneration and decadence also means that fascist thought on such subjects as race, economics, law, technology, or social housing considers specific issues within a palingenetic (often referred to as apocalyptic or millenarian) framework in which the chaos, anarchy, and violence of the modern world is imagined as the prelude to a new age, imbuing all violence with the purging, cathartic quality of creative destruction and positive nihilism. An example of this theme is fascist economics, which took the form of a vast and ultimately, failed experiment in corporatism, and in the Third Reich of a blend of state planning and state-coordinated capitalist activity, both of which were conceived as a Third Way between free market capitalism and Soviet planning and as instrumental to the nation's rebirth rather than a primary focus of state activity.

As a form of syncretism, some fascist thought is prone to draw on elements from the natural and human sciences, such as Social Darwinism, eugenics, demography, and physical anthropology, but may also appropriate the redemptive discourse of established Christianity wherever the church has retained a dominant role in society, replacing its theological-soteriological content with the promise of collective redemption through membership of the race and the historically forged community of destiny it forms under fascism. Rich case studies in the complex symbiosis that could arise between fascism and revealed religion are found in Italian Fascism, Nazi Germany, the Spanish Falange, the Romanian Iron Guard, and the Oxwagon Sentinel. Ultimately, even the lost overtly secular fascisms owe much of their mobilizing power to their ability to sacralize, through mythically laden discourse and ritual, the secular project of building a new national or racial community within historical time, and to the political religion and the spectacular displays of power they generate in their bid to do so rather than to any genuine otherworldly faith.

The appropriation of elements of Christian faith, or the generation of a pagan religion of the race, is characteristic of a further feature of fascist thought, namely its readiness to combine a powerful futural temporality directed toward a new order with elements drawn from a highly mythicized past. Thus, fascism celebrated its Romanity, the Nazis their Aryan past, and the British Union of Fascism the Elizabethan Age of combined cultural, commercial, and political power. In this context, fascism can be considered as a form of political modernism, addressing the crisis of modernity, which in interwar Europe was political, economic, social, and spiritual, by proposing a new rooted modernity. This proposal would create a new or regenerated national community able to provide a sense of belonging, purpose, and hope by bringing about the reenchantment of the world destroyed by such decadent aspects of modernity as materialism, individualism, atomization, anomie, communism, racial mixing, and the loss of contact with the blood and soil of tradition.

Interwar Fascism

In the period between the two World Wars, fascist movements, many of them small and successfully marginalized, arose in most European states, as well as in the United States, Brazil, Chile, and South Africa, the most prominent being the Falange in Spain, the Hungarist Arrow Cross, the Legion of the Archangel Michael in Romania, the French Croix de Feu, the British Union of Fascists, the Belgian Rex, the Norwegian Nasjonal Samling, the Croatian Ustasha, the Brazilian Integralist Action, the National Socialist Movement of Chile, and the Oxwagon Sentinel in South Africa. (The imperial regime that emerged in Showa Japan under Emperor Hirohito displayed features reminiscent of the Third Reich, but was rooted in a neofeudal social system that makes it distinct from fascism.) All were influenced by the success of Italian Fascism in gaining state power in 1922 and creating a single-party state in 1925, a demonstration effect further strengthened by Adolf Hitler's conquest of power between 1929 and 1933.

However, as a form of ultranationalism, each fascism of note was sui generis and hence, peculiarly adapted to local conditions. All interwar fascisms pursued the common chimera of an imminent ultranationalist revolution and frequently used organizational forms, imagery, and rituals

modeled on fascism or Nazism. Moreover, the contemporary impression of a fascist era lasting from 1918 till 1945 was strengthened by the way all right-wing authoritarian regimes of the day underwent a degree of fascistization (e.g., in Argentina, Portugal, Austria, Poland, and the Baltic states) to produce a phenomenon sometimes known as *parafascism*, and by the widespread perception of the Spanish Civil War as a historical showdown between fascism and communism to win the right to dictate the West's future. In the event, fascism was able to conquer state power to a significant degree only in Italy and Germany, though native fascisms shared state power briefly in Romania, colluded with Franco's authoritarian regime in Spain and Pétain's Vichy state in France, and contributed significantly to the state's collaboration with the Nazi occupation in Norway, Belgium, Hungary, Croatia, and the Slovak Republic. In several countries—Portugal, Austria, Romania, Hungary, and Brazil—fascist factions were ruthlessly suppressed by parafascist regimes, while on occasion factions within such regimes (e.g., in Slovakia, Vichy France, and Hungary) called for a greater degree of fascistization.

In the study of interwar fascisms in detail, it is helpful to distinguish between the dynamic, radical movement aspect in which utopianism is most evident, and fascism's manifestation as a regime, wherein considerations of expediency and realpolitik in grafting the new order onto the existing state and society become paramount. The polycentric state in the Third Reich retained elements of the Weimar and Wilhelmine orders and considerable elements of pre-fascist Italy survived in the fascist state under Mussolini. In fact, all fascisms of a significant size hosted various ideological currents, making generalizations about interwar fascist thought hazardous beyond a common commitment to a nebulous myth of national rebirth. Authoritarian regimes also contained competing currents of conservative and radicalizing or fascistizing factions.

The stress within recent scholarship on the modern, palingenetic dynamic within fascist thought, however rationalized or scientized, leads to a radical reassertion of the fascist relationship to modernity. It was generally held by Marxists and non-Marxists alike that fascism was antimodern and backward looking, despite the fact that in several fascisms (Nazism, Fascism, BUF, Brazilian Action) there was a strong stress on the technocratic dimension of

their project. In fascism, for example, the celebration of Romanità was accompanied by major public works, self-consciously conceived and executed, as in the Third Reich, with an ultramodernist spatial aesthetic, to modernize the country's infrastructure and to celebrate such products as airplanes, modernist buildings, town planning, a welfare system, and synthetic fibers. Nazism's technological achievements were even more advanced in the sphere of transport, jet propulsion, weapons technology, and its embrace of eugenics and of industrialized methods of mass murder. Major efforts were undertaken in both Germany and Italy to socially engineer a new national character and a "new man" so as to raise the nation out of the maelstrom of the 1920s. In the sphere of art and architecture, ambitious cultural and architectural schemes were undertaken and imbued with a modernist ethos, even if aesthetically Nazism condemned much modern experimental art as decadent. It is thus legitimate to speak of fascism's attempted social, cultural, and even anthropological revolution as long as the extremely variegated forms assumed by fascist culture are borne in mind.

Postwar Fascism

With the defeat of the Axis powers in 1945, the reestablishment of liberalism and capitalism, and the shocking revelations of the millions of atrocities committed in Nazi killing fields, concentration camps, and death camps, the historical conditions that could generate mass support for a national variant of fascism largely evaporated throughout the world. In particular, the history of Nazism revealed for all but the most fanatical racists the unrealistic utopianism of the fascist vision of an alternative modernity, and the systemic inhumanity that resulted once its theoretical assaults on liberal democracy, communism, cosmopolitanism, and any supranational concept of humanity were translated into radical action. The war also exposed the wide gulf that separated the rhetoric of the Fascist and Nazi regimes from the change they were able to engineer in practice and the disastrous consequences of a national politics based on the militarization and regimentation of society, one that led in practice to invasion, occupation, and in the case of Germany, to the wholesale destruction of major cities. Rather than being the epoch-defining power it seemed to its

pre-1945 followers, fascism now faced major problems reinserting itself into political space.

As a result, postwar attempts to emulate directly interwar fascist parties (but without the paramilitary wing that characterized them), or paramilitary formations (though without the accompanying electoral party) pursuing goals of national rebirth, have failed to make headway. The most important of such attempts, the Italian Social Movement in Italy and the National Democratic Party in Germany, went to considerable lengths to camouflage their historical links and sympathy with Benito Mussolini's and Hitler's regimes and to adopt a democratic façade. Those who recognized the failure of mimetic fascism have been forced to adopt a variety of ideological, tactical, and organizational strategies to keep alive the prospect of a fascist revolution, however remote, now that its political space for maneuver has been so drastically curtailed by its association with the Third Reich. This space came to be further restricted by the rise of radical right-wing populism, which channeled ethnocentrism, xenophobia, and racial hatred into nonrevolutionary, electoral forms of identity politics, however antidemocratic their deeper convictions. Significant radical right-wing populist parties have arisen in Scandinavia, Holland, Belgium, France, Switzerland, Austria, and Italy and in states that had newly emerged from communist rule, such as Hungary and Slovakia, thus draining fascist groups of some of their potential popular support electorally while maintaining covert links with extremists. France's Front National is paradigmatic of this development. Symptomatic of this change of tactics by revolutionary nationalists and racists is the way numerous forms of fascism have abandoned the arena of party politics and mass mobilization to concentrate on extra-parliamentary opposition in the form of agitation, sporadic violence, and terrorism or have abandoned activism altogether for the realm of ideological and cultural theory. This move has made fascism's threat to the institutions of democracy almost undetectable when only interwar definitional criteria are applied.

Initially the most significant of these tactics organizationally was groupuscularization, whereby the typical fascist who retained revolutionary aspirations no longer sought to form or join mass parties with charismatic leaders but found an outlet for his or her disgust with liberal democracy or

state communism in a formation with a few hundred or even fewer active members. These groupuscules had no party-political existence, uniforms, or charismatic leadership, and often just an occasional leaflet to document its existence. Yet some did have self-appointed violent or paramilitary cadres, ensuring that radical forms of ultranationalist or racist fascism continued to be nurtured all over the Western world, and making fascism a rhizomic subcultural factor rather than one concentrated in high-profile national arboreal organizations (with main trunk and branches).

In terms of ideology, one significant development has been the internationalization of the fascist vision of a new world, symptomatic of which was the appearance shortly after the war of various forms of Eurofascism and Universal Nazism, a form of Nazism that sees itself as engaged in a global battle for white supremacy and that has established local chapters in places as far-flung as California, Russia, and Australia. One of these modern offshoots, International Third Position, attempted to form an ideological link at the height of the Cold War between European fascism and countries such as Gaddafi's Libya that they imagined were seeking a Third Way between capitalism and communism. Another group saw themselves as political soldiers with nebulous ambitions of forming a cadre of dedicated fascists, while groups preparing to fight a terrorist war against the system emerged in Italy and Germany, leading to a number of outrages against the general public in Italy and Germany in the 1970s and 1980s.

One outcome of fascists forging alliances with other enemies of a globalizing Euro-American society, especially since 9/11, has been the conversion of a number of Universal Nazis to Islamism (e.g., Ahmed Huber, David Myatt). A completely different fascist tactic for organizing a revolt against the modern world emerged in the late 1960s when a faction grew up around the prolific autodidact intellectual Alain de Benoist claiming to represent a Nouvelle Droite or New Right. Converts to this program, which soon established a copious publicist presence on the margins of mainstream culture, abandoned electoral politics and violence for metapolitics, which, deliberately distancing itself from biological racism and associations with historical fascism, took the form of erudite cultural criticisms of liberal and Marxist humanism and celebrations of cultural

heritage and differentiation so as to achieve cultural hegemony for the antidemocratic right, a tactic known as right-wing Gramscism. This approach expressed itself as a concerted but often encrypted attack on multiculturalism and pluralistic democracy in the name of preserving national homogeneity, primarily through articles and books designed to lay the ideological basis for a future historical transformation in a neo-fascist direction with a pan-European spirit. France, Germany, and Italy have become homes of particularly prolific forms of such New Right differentialist racism, but apart from providing elaborate rationales for attacks on pluralist democracy, these groups have had little discernable impact on democratic politics. The exception is Russia, where Aleksandr Dugin, the main disseminator of an overtly fascist body of New Right ideas, has held a major academic post and enjoys a certain influence on mainstream Russian politics as well as in other countries, such as Turkey, struggling for cultural independence from the West.

Far more significant than metapoliticization has been the virtualization of fascist thought and propaganda through a vast network of websites dedicated to attacking the enemies of national or racial rebirth, a theme that lends itself to images of a global racial Armageddon that turned William Pierce's *The Turner Diaries* into an international best seller of neo-Nazi fascism with an explicit hatred and threat of violence impossible in real social and political space. Cyberfascism is responsible for preserving the most radical variants of fascist thought and for contributing to the radicalization of numerous fascist activists, while also realizing as a virtual community the dream of some inter-war ideologues (e.g., Drieu la Rochelle, Asvero Gravelli) that fascism would become an international force. The purest remnants of interwar fascism at its most radical in thought and lethal in intent can be seen in the terrorist attacks against carefully selected targets of civil society carried out by American Timothy McVeigh (1995), Englishman David Copeland (1999), and Norwegian Anders Breivik (2011).

Fascism's revolutionary force was seemingly exhausted by 1945. Nevertheless, in some of its new postwar guises, it has retained on a highly restricted local level some of its former potency to orchestrate racial hatred, spread fear among ethnic and religious minorities, and both plan and

occasionally carry out terrorist attacks against the decadence of civil society and thus provoke a widespread if temporary sense of national emergency. For hard-core fascists, this decadence still may be allegedly embodied in the traditional enemies of their cause (Jews, homosexuals, representative democracy, the left). Increasingly, however, the growing decadence is attributed to modern democracy's attempted social integration of African Americans, Afro-Caribbeans, Muslims, and other ethnic and religious minorities, its program of a multicultural, multifaith society, its one world egalitarian vision of humanity embodied in the United Nations, G7, and McWorld consumerism, its perceived erosion of unique ethnic identities, the loss of cultural heritage and collective national or racial memory, and the Islamization of the West.

The Debate About Fascism's Definition

The characterization of fascism offered above cannot claim to represent more than a broad spectrum of current expert opinion. The precise meaning of the term within the human sciences, as well as its heuristic value for the study of history, has been highly contested in the past, with each national culture spawning its own debate about fascism's meaning and significance. To confuse things further, the term's use outside academia has degenerated into a crudely offensive term suggesting authoritarianism, draconian regimentation, or fanaticism displayed in defense of a particular cause, as in the words and phrases *ecofascism*, *homofascism*, *fashion fascism*, *body fascism*, *health fascism*, or even more controversially, *Islamofascism*. The value of the term as a precise tool of historical analysis has been further degraded by the fact that the extreme nationalism of fascism and its attempts to adapt capitalism to its goals of sociopolitical transformation rather than destroy it have been interpreted by Marxists since the 1920s as the sign of fascism's essentially reactionary or counterrevolutionary dynamics. The Soviet agent theory treats fascism as the tool of finance capitalism, whereas the Bonapartist theory sees fascism as a semiautonomous faction emerging with some genuine mass popularity in interwar Europe to serve the interests of the bourgeoisie at a time of class conflict and national crisis, whatever its pretensions to do otherwise (along the lines of Louis-Napoléon Bonaparte).

Outside the Marxist tradition, profound confusion reigned within liberal academia until Anglophone scholarship developed a relatively coherent and cogent view of fascism by building on the pioneering theories of Eugen Weber, George Mosse, Juan Linz, and Stanley Payne, later corroborated by Italy's foremost historian of fascism, Emilio Gentile (whose argument was clearer than the famous but cryptic one proposed by Ernst Nolte). By the late 1990s, it was becoming academic common sense to acknowledge the existence of a fascist ideology that aspired to cleanse the organically conceived nation of decadence and bring about its renewal in a postabsolutist, postliberal, or postcommunist new order, an integral part of this process being an anthropological revolution through the social engineering of a new man. However, this new consensus has been vigorously challenged by certain academics, notably A. J. Gregor, Robert Paxton, Michael Mann (of the United States), Kevin Passmore (of the United Kingdom), Wolfgang Wipperman, and Arnd Bauerkämper (both German), and it has little currency in Italy, Germany, and France. Many historians of extremism still use idiosyncratic definitions of fascism, such as Walter Laqueur's use of the term to embrace Islamism, which most would regard as a generically separate phenomenon given its roots in the arch-conservatism of a traditional religion. The new consensus is nonetheless becoming the industry standard approach in most countries regarded as peripheral to mainstream fascism (e.g., Romania, Hungary, Scandinavia, the Baltic States, the former Yugoslavia, and the Iberian peninsula), and it has led to a surge in both the quantity and quality of new studies of fascism.

Meanwhile, despite its best-seller status and its influence in right-wing circles in the United States, Jonah Goldberg's oxymoronically titled *Liberal Fascism* is to be treated with considerable caution. Its mimesis of academic discourse in the bid to convince ingenuous readers with Republican leanings that the essence of fascism lies in the same left-wing tradition of politics that surfaced in Franklin Roosevelt's New Deal and culminated in the state interventionist liberalism of the contemporary U.S. Democratic movement under President Barack Obama, is best regarded as a cynical and propagandistic exercise in defamation by association. Fascism was, and is still in some cases, a hybrid of extreme right and left components, as is implicit in the phrase *national socialism* (a term used by Mussolini as early as 1917). It proposes a revolutionary alternative to liberal democracy. It is

inaccurate to airbrush out the profoundly antiliberal and right-wing content of fascism in order to use it, as Goldberg does, as a pejorative term for maligning opponents on the reformist left.

Federalism

Federalism

Federalism

Federalism is a unique kind of political organization in which subnational governing units share political power with a centralized governing unit. But federalism has numerous variations as it is implemented in countries ranging from the United States, to India, Switzerland, Iraq, and Brazil, and it serves as the foundation for international governing bodies such as the United Nations, the North Atlantic Treaty Organization (NATO), and the European Union. With federalism comes the opportunity to protect rights, honor both minority and majority interests, accommodate diversity, and promote cooperation, liberty, and obligation.

Unfortunately, federalism's place within modern political theory is tenuous and hence it remains undertheorized. Federalism stands in opposition to the most dominant paradigms in modern political theory and especially those in the Enlightenment that embraced the premise that if something is right in one place, it is right in all places. Federalism rejects such certainty, thus allowing it to accept variations in policy and law, whereas the Enlightenment tended to promote uniformity.

The most influential treatises on federalism are arguably Immanuel Kant's *Perpetual Peace* ([1796] 1939) and James Madison, Alexander Hamilton, and John Jay's *Federalist Papers* (1787–88), but there are many other books and thinkers who have added to our knowledge of what federalism is and what it ought to be.

Kant (1724–1804) wrote about how a federal arrangement could be utilized to secure perpetual international peace. According to the Second Definitive Article of *Perpetual Peace*, a federation among free states would be established rather than a peace treaty or a universal state. The federation would be able to step in and correct states when they were not acting as free states should and to reconcile differences between confederated free states.

Kant signaled a shift in federal thought as he turned it into a way of organizing internationally rather than domestically. Looking for a way toward perpetual peace, Kant asserted that if democratic nations could be linked together through a federative system, then a world government could be created based on the federal idea, which would bring about perpetual peace. The Kantian justification for a federal regime, shared by other federalism scholars, asserts that federalism combines the best of the big and the best of the small without incorporating the drawbacks of either.

In small nations, Kant argued, people feel more attached to their country and to one another, are more politically engaged and receive better representation than the citizens of large countries. On the other hand, small nations are vulnerable to external attacks and are not always equipped to deal sufficiently with domestic issues such as rioting or natural disasters. Although large nations make it difficult for the people to hold their leaders accountable and their people find it difficult to coalesce around a single common good, they generally have stronger militaries and are better equipped to deal with domestic disruptions.

Kant argued a position similar to those of others who came before and after him. John Stuart Mill (1806–73) followed the sentiment of Kant when he supported federations as a way of achieving peace by reducing the number of weaker states and thereby ending the temptation to aggression of competing states. He made this argument in chapter 17 of *Considerations on Representative Government* ([1861] 1958) in the same year that the U.S. Civil War began, thus demonstrating that a federated republic is insufficient to produce peace.

Unlike Kant and Mill, who emphasized federalism for international peace, most of the influential theorists focused on how federalism could help individual nations thrive. Among the most famous federalism thinkers in

modern political thought are Madison, Hamilton, and Jay; Baron de Montesquieu (1689–1755); Alexis de Tocqueville (1805–59); John C. Calhoun (1782–1850); and Pierre-Joseph Proudhon (1809–65). None of them explicitly pursued a world free from war via federation.

The best of the big and the best of the small argument was pursued most fully by Montesquieu and given its fullest expression and application in the United States. After the U.S. won its independence from England, the most influential statesmen in the new country decided that the country needed a new constitution because the existing one, the Articles of Confederation, provided for a government that was too weak to confront the challenges of the new republic. The Articles stipulated a central authority without enough power to coordinate efforts among the states, to raise taxes for public expenditures, and to enforce national policies. The new Constitution, drafted in 1787 and ratified in 1788, would shift the balance of power away from the states so that the national government would be able to control the actions of the states when it was found necessary to do so, but the states would retain some of their initial sovereignty. This arrangement demonstrated a shift from a confederation to a federation. *The Federalist Papers*, penned by John Jay (1745–1829), Alexander Hamilton (1755–1844), and James Madison (1751–1836) under the pseudonym Publius, put forth the arguments in favor of the new Constitution, which included a defense of the new federal arrangement.

Publius cited Montesquieu but refined some of his ideas to fit the needs of the American people. The United States was perhaps the first federal regime to be consciously developed from theoretical propositions. Years later, on his tour of the United States, Tocqueville praised the American version of federalism for preventing tyranny and permitting effective governance. Through administrative decentralization, Tocqueville argued, democracy in America would not succumb to tyranny, for decentralization allowed for state and local issues to be decided at those lower levels. This limit on national power, he thought, would help prevent injustice.

John C. Calhoun was an American statesman and philosopher whose most influential work was published posthumously. He agreed with Tocqueville that the key to the preservation of liberty in America was decentralization.

Calhoun argued for greater states' rights for fear that the policies being pursued in Washington, DC, would strip the nation of its federal character and create a single unified nation without states. Calhoun's singular idea was that of concurrent majorities, which would prevent a mere numerical majority at the national level from making laws governing the states. What was required under American federalism, he argued, was majority consent from each state in order for a national policy to take effect. The result would be stronger localized government. Calhoun lost his argument in the United States, but the concept of concurrent majorities has influenced many contemporary academics, such as Arend Lijphart (b. 1936) and his theory of consociationalism.

Pierre-Joseph Proudhon advocated federalism for different reasons altogether. Echoing the justifications first expressed by the philosopher Johannes Althusius (1557–1630), and anticipating contemporary communitarians, Proudhon sought a system of natural communities such as families and guilds that would unite with one another for specific purposes. The state would thus be only one of many affiliations within an individual's life, and no affiliation would be sovereign or exercise absolute authority. The result, Proudhon hoped, would be that individual liberty would be preserved and the needs of individuals and societies would be met. The Proudhonian justification of federalism is echoed by more recent advocates of federalism such as Daniel J. Elazar (1934–99) and John Kincaid.

Nations that are seeking a transition from authoritarian regimes to democracies have turned to federalism as a way to provide adequate representation for diverse ethnic groups. This trend has encouraged political theorists to search for a normative justification for federalism and to incorporate the views of those having concerns over political representation and recognition. In diverse nation-states there is a tendency for one group to use the force of government to suppress another. Federalism scholars suggest that if political institutions and boundaries are drawn with respect to ethnic divisions, this problem can be alleviated. Belgium, with most of its population divided between two predominant cultural and linguistic groups (Flemings and Walloons), serves as an example of how this solution can work. Belgium could be a model for conflict-ridden countries such as Sri

Lanka and Iraq and for rebuilding countries such as Egypt and Libya that are looking for ways to bring disparate ethnic groups together.

The most influential attempts to theorize about federalism incorporate aspects from each of the previous traditions in addition to others. Building on the best of the big, best of the small argument, modern federalism scholars start with the assumption that there is a natural scale to human ordering that must be respected. A nation that is too large will undermine people's natural attachment to place and community and therefore strip them of their inherited identities. On the other hand, a nation that is too small will leave this same group unable to defend itself militarily or to take advantage of economies of scale. So federalism scholars pursue a system that can balance these two forces.

Additionally, federalism scholars recognize the ability of territorial and nonterritorial federalism to address claims by minorities, indigenous peoples, and other persecuted groups who seek representation and recognition. By granting groups a voice in the national government, as well as granting them sovereignty over a clearly defined geographical area, federalism can uniquely help these groups preserve their right to self-determination while not infringing on another group's right to self-determination.

Contemporary justifications of federalism reflect a turn away from the trend of the modern nationstate. Federalism scholars recognize the need for government but are skeptical of the scope and size of the governments associated with the modern nation-state. In some sense they comprise an opposing force against definitions of world order since the Peace of Westphalia (1648) and the conception of sovereignty offered by Jean Bodin (1530–96) and Thomas Hobbes (1588–1679). What started as a way to organize Europe and end tribal warfare has turned into a Leviathan that threatens the existence of natural identities and associations valued by these scholars of federalism.

What can be seen in the rise of federalist thinking at the end of the twentieth century and the beginning of the twenty-first is a turn away from the universalism that characterizes much of modern political thought. Just as the nation-state tradition that arose out of Westphalia turned away from the

parochialism, tribalism, and feudalism that predated the modern nation-state, federalism is a force pushing against the dominance of the nationstate. Federalism scholars take as their guides the premodern teachings of Aristotle, Althusius, and St. Augustine with an eye toward modern concerns of liberty, equality, and human rights. This approach makes federalism an amalgam of old and new.

Federalist Papers

The *Federalist Papers* consist of eighty-five essays written by Alexander Hamilton, James Madison, and John Jay, published under the pseudonym of Publius, to encourage the American people to ratify the Constitution in 1787 to 1788. The essays explained the necessity of federalism, limited government, and constitutional democracy, as well as answering the objections to the proposed Constitution that had been raised by those weary of a strong central government. The essays first appeared in *The Independent Journal* and the *New York Packet*, New York newspapers, beginning on October 27, 1787, and ending in March 1788. At some points during the lifespan of the publication, up to three or four new essays by Publius were featured at a time. Following publication of the entire series, the essays were also published by Hamilton in a two-volume edition as *The Federalist*.

Origins in Unrest Over the U.S. Constitution

The Constitutional Convention in Philadelphia lasted three months and ended on September 17, 1787. The result of the convention was a constitution consisting of a series of compromises between, among others, those who were proponents of a strong federal government and those concerned with the sovereignty of state governments. With most delegates disappointed by the failure of the Articles of Confederation, the essential feature of the new document was federalism, the idea that numerous states

could be permanently united under a strong central government with a variety of powers, but at the same time, these states would still maintain liberty for their people as well as the management of their own internal affairs. However, not everyone agreed that the new government of the United States should take this formation of federalism. As a result, public opinion was split on the proposed constitution, which was presented to the people for ratification by each individual state.

Those in support of ratification were not without their own disappointments in the final draft of the Constitution, with reservations as to whether their own priorities were too heavily compromised to achieve the intended goals. The private papers of both Hamilton and Madison show that neither of them believed the compromises of the convention ended with a constitution that sufficiently supported a strong government. The authors of *The Federalist* downplayed their own reservations about the newly drafted Constitution and put forth what they believed to be the strongest possible defense of it. The *Federalist Papers* represent the best possible defense that Hamilton and Madison, as well as Jay, could make of the new constitution to show that what was being presented to the people for ratification was better than the old confederation set up under the Articles of Confederation. In fact, when Hamilton signed the Constitution, he believed that what was finally agreed to at the convention was far from what his original plan for it had been but that his choice was between “anarchy and Convulsion” on the one hand, and “the chance of good to be expected from the plan” on the other hand (Harold and Cooke 1961, 4:253). Madison, despite his public defense of the Constitution, held even greater skepticism, writing in private to Thomas Jefferson that if the Constitution was to be adopted, it would not effectively achieve its national goals and would not “prevent the local mischiefs which every where excite disgusts against the state governments”(Rutland 1977, 163–64). With these concerns about the Constitution, Hamilton and Madison set out to craft their defense, not to be written as a neutral account of the meaning of the Constitution, but rather as part of a heated debate over whether or not to ratify the Constitution.

Rival essays were often presented on the same newspaper pages as *The Federalist*, questioning the motives of Publius as well as the worth of the proposed Constitution. Known generally as the antifederalists, the

opponents of the Constitution feared that it would create an overly strong central government, subverting republicanism and leaving the people in a tyrannical situation similar to the one they had previously freed themselves from under British rule. The Constitutional Convention was convened to correct the mistake of giving too much power to the state governments under the Articles of Confederation, but the anti-federalists argued that the end product, supported by the federalists, was duplicating the features of British rule by giving too much power to the national government. While the anti-federalists were disappointed that a Bill of Rights was not included in the Constitution, it was the dangerously empowering tenets, such as the executive powers, the powers of taxation, the supreme-law-of-the-land clause, as well as the ability of Congress to do what is necessary and proper to fulfill its allocated powers, that would leave the states at the mercy of the national government.

A leading anti-federalist at the Convention, George Mason, refused to sign the Constitution, charging that if ratified it would actually deprive Americans of their liberty by virtue of the numerous powers given to the national government. The federalists argued that the checks and balances in the Constitution that ensured that no branch of government had too much power would be enough to protect the people from tyranny, but those who remained anti-federalists remained unconvinced, arguing that a powerful legislature and an executive with daunting powers did not look like the government they had fought for.

Just ten days after the final draft of the Constitution was signed, New York's governor, George Clinton, started a series of letters under the name of Cato. The letters were published in *The New York Journal* with the objective of ensuring that the Constitution was not ratified, and doing so by showing the people of New York its defects. Hamilton answered with his own counterattack on the opponents of the Constitution, but then quickly stopped his series of letters, preferring the much larger endeavor of writing the collaborative effort with Madison and Jay. Calling the series of essays *The Federalist* took away from the Constitution's opponents a name they thought they rightfully deserved. It was, after all, the anti-federalists who they believed represented the very essence of what was understood as federalism, standing up for maintaining two levels of government in a loose

confederal system as had been set up under the Articles of Confederation. In contrast, the federalists were advocating for a centralized, and powerful, national government.

Hamilton would again trump the anti-federalists when choosing the pen name to be used. The anti-federalists had already published essays in papers under the names of Cato and Brutus. The Roman Cato was known for his moral integrity as well as for his political battles with Julius Caesar. Brutus was most remembered for his role in the assassination of Caesar. Hamilton chose not a defender, but actually one of the founders of Rome, Publius (Valerius Publicola), a Roman consul who improved the city's primitive republican laws, establishing a republic that would thrive for centuries.

Contents

Hamilton asked Jay to help with the series, but Jay fell ill and contributed only five essays on foreign policy, a subject he was an expert in, having been one of three Americans (along with Benjamin Franklin and John Adams) involved in drafting the Treaty of 1783 that would end the Revolutionary War. Hamilton also asked Gouverneur Morris, a delegate at the Constitutional Convention from Pennsylvania—and future one-term senator—to be a contributor, but Morris declined to participate. Madison agreed to help write the essays, and he and Hamilton took up topics for which they had materials already prepared that they had worked on at the Convention. Hamilton discussed the weaknesses of the Articles of Confederation in such areas as ensuring domestic stability, adequate war powers, and the lack of a taxation power and commercial regulation. Hamilton also defended the need for an energetic executive and defended the proposed judiciary. Madison advocated for the Constitution's separation of powers, federalism, and republicanism, while also explaining and justifying the proposed House of Representatives. Hamilton and Madison shared the writing duties concerning the proposed Senate.

Since *The Federalist* was written to defend the proposed Constitution, *Federalist* #1, written by Hamilton, promised to provide an “answer to all the objections . . . that may have any claim to your attention,” and would be divided into two sections. The first thirty-six essays would discuss the need

of union in a large republic, with emphasis on the danger of foreign wars and influence, to be countered by a strong new national government, as well as the advantages to be achieved by a federation in such areas as commerce, the economy, naval defense, and representative government in more general terms. The second half of *The Federalist*, essays thirty-seven to eighty-five, discussed the merits of the Constitution itself. Several specific essays stand out.

Written by Madison, *Federalist* #10 is known for its defense of a large republic as essential in remedying faction. Madison's *Federalist* #51 examines the checks and balances and separation of powers put in place by the Constitution for the purpose of counteracting ambition. It is our human nature, Madison explains, that makes it a necessity to "first enable the government to control the governed; and in the next place, oblige it to control itself." Hamilton's *Federalist* #84 is best known for its arguments opposing the addition of a Bill of Rights. Hamilton and Madison agreed that the Constitution as written would naturally protect individual liberty through the separation of powers and the checks and balances placed on the elected branches of government. Finally, *Federalist* #78 finds Hamilton's take on the judiciary, suggesting it to be the weakest branch of government because it cannot spend money and has no power to execute its own decisions—and then arguing for the Supreme Court's power to negate unconstitutional acts by the other branches of government.

The *Federalist Papers* tend to be regarded as representing the collective thought of the framers who had debated and written the Constitution, not the personal views of the authors. However, Madison himself acknowledged that the two elements were intermingled. The ideas at the Constitutional Convention were diverse; some states sent delegations that were heavily involved in the debates, while Rhode Island refused to send anyone at all. At the end of the convention, three of the fifty-five delegates refused to sign the Constitution, while others who did sign it would later have second thoughts. Realistically, no one was likely to be completely satisfied with the final draft. Perhaps the best evidence that the framers' collective intent is altered in the essays are the views on the role of government by Hamilton and Madison themselves. After ratification, Hamilton and Madison developed a sharp disagreement on the meaning of

the Constitution, with Hamilton remaining a Federalist and Madison becoming a Republican—the political party started by Madison and Jefferson that reflected the sentiments of the anti-federalists, defending states' rights and rejecting federalist policies such as Treasury Secretary Alexander Hamilton's proposed new national bank.

Regardless of whether or not the arguments found in the *Federalist Papers* can be attributed to an overarching viewpoint developed at the Constitutional Convention, the essays have profoundly influenced the study of American politics. The *Federalist* is widely admired and studied. Both philosophical and practical in nature, it is even more grounded in the reality of the times than other works examining the purpose of government, such as John Locke's *Second Treatise of Government* or Baron de Montesquieu's *Spirit of the Laws*. Further, *The Federalist* did not need time for the public to recognize its value. Within a year of the drafting of the Constitution, the *Federalist Papers* were understood to be a guide to explain the necessity of each clause proposed in the Constitution. The essays that make up *The Federalist* are often read individually for their insight into such issues as federalism, the separation of powers, the need for a strong national government, and judicial review, but when considered in its entirety, *The Federalist* ranks just after the Declaration of Independence and the Constitution itself as explanations for the eventual shape of politics and institutions in the United States. In fact, Jefferson described *The Federalist* as “the best commentary on the principles of government, which ever was written” (Lipscomb 1903, 183).

There is some debate as to what impact Publius had on the actual ratification of the Constitution. Authors at the end of the nineteenth and start of the twentieth century considered *The Federalist* as being influential in the ratification process, but this view no longer prevails. By the middle of the twentieth century, it was argued that the *Federalist Papers* had very little, if any, direct impact on the ratification process. The Constitution needed to be ratified in each state. The *Federalist Papers* were published in New York, with few exceptions. A small number of individual essays were reprinted in Virginia, papers two through nineteen were printed in the *Pennsylvania Gazette*, and seven were printed in Boston. By time Hamilton, Madison, and Jay started publishing the essays, some states, including

Pennsylvania, had already voted to ratify the Constitution. If the essays were in any way influential in the ratification of the Constitution, it would have had to be in the state of New York alone. However, by the time the state convention was held to vote on the Constitution in New York, the Constitution had already been ratified by ten states, with only nine required for the Constitution to be ratified. Thus, the Constitution was already in effect when the citizens of New York voted.

Feminism

Feminism is rooted in the belief that women are unfairly disadvantaged compared to men and that this inequity is manifested politically, economically, socially, and culturally. Feminism endeavors to redress this imbalance, principally by challenging traditional conceptions of femininity and by campaigning for political, legal, and social reform via organized activity promoting women's rights and interests. However, although this overall characterization has remained accurate, advocates of feminism have often disagreed on its aims and methods. It would be a mistake, therefore, to view feminism either as a unified political movement or as a single philosophical doctrine.

Early and Liberal Feminism (1700–1968)

Before the twentieth century, women had no legal representation and little access to education. Women were economically dependent upon fathers and husbands, and once married, any property they owned was automatically transferred to their husbands. Women had no legal right over their children, who belonged to fathers in the eyes of the law. However, during this early period, advocates of feminism— although the term was not in popular usage until the late nineteenth century—sought to challenge prevailing attitudes toward women that viewed them as incapable of either rational thought or rational moral behavior. These beliefs were endemic, perpetuated not just by the law, but by philosophy and religion.

From the 1700s onwards, conservative ideas about women's nature have tended to focus on women's role as primary caregivers. Women, although allegedly inferior to men physically and intellectually, were said to have a natural virtue that suited them to exerting influence on society through their role in the home as mothers and as teachers. Such assumptions were criticized by feminists including Elizabeth Cady Stanton and Emma Goldman, who argued that women should have the opportunity to participate in, not withdraw from, public life.

The late seventeenth and early eighteenth centuries saw a proliferation of debates concerning the status of women, during which a number of participants sought to challenge traditional beliefs about women's nature. Mary Astell was regarded as the first English feminist and was active in promoting the cause of women's education. Astell argued that women should have the same educational opportunities—theological and philosophical—as men and that their roles should extend beyond those of mothers or nuns. In *Some Reflections upon Marriage* ([1700] 1970), Astell suggested that marriage functioned largely for political and economic ends to the detriment of individuals, especially women, who were forced to assume the role of men's property. Hence her famous conceit: "If all men are born free, how is it that all women are born slaves?"

If Astell remained relatively obscure in her time, Mary Wollstonecraft (1759–97) achieved nothing short of notoriety. *A Vindication of the Rights of Woman* was published in 1792 (1992) and created a scandal that was bolstered by the author's tumultuous and unconventional personal life. Self-educated and financially independent, Wollstonecraft argued passionately for the education of women and girls. In an era that saw social and political upheaval in both the United States (American War of Independence, 1775–82) and France (French Revolution, 1789–99), Wollstonecraft asked why the new liberal discourse of rights should not extend to women, who should have the same access to education, the same right to own property, and the same entitlement to protection by the law as men. Wollstonecraft did not, however, argue for universal suffrage, nor did she find it desirable that women should leave the domestic sphere altogether. The ideal woman would be an educated and rational citizen who was able to combine her domestic and civic duties for the benefit of all.

If feminism's first wave began with Wollstonecraft's manifesto for women's rights, debate concerning the status of women remained largely in the social and cultural arenas until the end of the nineteenth century, at least in Britain. In the United States, liberal rights discourse emerged in response to the combined effects of the American War of Independence, abolitionism, and the temperance movement and became more explicitly activist and politically oriented than in Britain. At the Seneca Falls Convention of 1848—organized by Elizabeth Cady Stanton, Lucretia Mott, and Susan B. Anthony—three hundred people (including forty men) gathered to demand married women's property rights, the modification of divorce laws, and the vote for women. The convention's impact was mixed. Wyoming was the first U.S. state to grant women the vote, in 1869, with all other states complying by 1920 (following the Nineteenth Amendment).

In Britain, debates relating to universal suffrage and women's education were reignited in the 1860s by two treatises: John Ruskin's (1819–1900) lecture "Of Queen's Gardens" (1864) and John Stuart Mill's (1806–73) *The Subjection of Women* (1869) (see Millett 1971 for an extensive discussion). Ruskin's lecture at Manchester Town Hall in 1864 expounded the separate spheres notion that prevailed in Victorian Britain: women belonged in the domestic, familial sphere, men in the public sphere of the economic and political. Ruskin's treatise was mired in his fascination with medieval romanticism, and although it provoked criticism on both sides of the debate, it upheld enduring opinions about femininity and women's role in society.

With the full collaboration of his wife, Harriet Taylor (whose name nonetheless did not appear on the title page), Mill published *The Subjection of Women* in 1869. Echoing Astell and Wollstonecraft, Mill and Taylor argued against the treatment of women as slaves, insisting that the legal subordination of one sex to another was a hindrance to human improvement. For Mill, men and women were entitled to equal rights, including the vote.

In the early twentieth century, growing demand for the vote for women culminated in the suffrage movement. Although the late 1800s witnessed a series of important legal and social advances for women—including the Married Women's Property Act (1870) and some amendments to divorce

law—they were still denied the vote. Emmeline Pankhurst (1858—1928) founded the Women's Social and Political Union (WSPU) in 1903. The WSPU embarked on a series of campaigns between 1903 and 1914 intended to draw public attention to the cause of women's suffrage. However, despite the WSPU's efforts, Herbert Asquith's Liberal government remained hostile. The start of World War I in 1914 effectively put an end to their campaign. The vote was eventually won in the United Kingdom in 1920 for women over thirty and in 1928, for all women over twenty-one; this change was largely due to recognition of the efforts of women during wartime. Some European countries had already extended the vote to women early in the twentieth century, such as Finland (1906) and Norway (1913), but for many others, such as the United Kingdom, World War I was a turning point and most European countries granted women the vote in the period soon after. In the United States, after successive calls for woman's suffrage and under pressure from the National Woman Suffrage Association (NWSA), the Senate passed a suffrage bill on June 4, 1919. This bill was later ratified in the Nineteenth Amendment (August 1920), which abolished sex-specific restrictions on voting.

Reform or Revolution?

After many women were required to fill traditionally male roles during World War II, the postwar era saw a regression to traditional roles. Although women now had the right to vote, own property, and obtain a divorce, the 1950s were a stifling and austere time for many. Women were still deprived of the same educational opportunities as their male peers; for example, in the United Kingdom, they could attend Oxford or Cambridge but were not allowed to graduate. And although many, especially working-class women, were employed, they earned less than their male colleagues for doing the same work. However, in the United States, Betty Friedan's *The Feminine Mystique* was published in 1963 (1983) and heralded the start of the second wave of feminism. Friedan established the National Organization for Women (NOW) in 1966, primarily in response to the Equal Employment Opportunity Commission's failure to take the issue of sex discrimination seriously. But like her liberal predecessors, Friedan advocated improving the status quo rather than radically altering it. The politics expounded in *The Feminine Mystique* can be located within the

liberal rights tradition that emphasized individual responsibility: women must achieve their full potential, but it is the state's role to secure women this freedom. (One of NOW's most important campaigns was for a Bill of Rights for Women [1967], demanding equal pay and protection from sex discrimination in the workplace.) Although Friedan advocated reform rather than revolution, one of the central achievements of *The Feminine Mystique*—in which Friedan wrote from the perspective of women's day-to-day experience—was its emphasis on *consciousness-raising*, the notion that women's experiences should be used to champion political causes. This view was one of the origins of the adage that the personal is political.

Although her contribution to feminism was remarkable, Friedan was criticized for overlooking the experiences of many women, particularly working-class and black women; she once notoriously referred to lesbians as the Lavender Menace. Friedan was also criticized for underestimating the oppressive power of institutions such as marriage and the family. The question underlying the start of the second phase of feminism was this: How do we explain the nearly universal domination of women by men? The varying answers shaped the contending views of diverse feminists on the related question of what should be done about it.

Radical-Socialist Feminism (1968—)

The origins of feminism's second wave were complex and divergent, in both the United States and Britain. In the United States, the Civil Rights and anti-war movements contributed to an atmosphere of discontent and change, from which the women's liberation movement emerged. Disillusioned by the American New Left, which continually failed to recognize the social and economic oppression of women, dissenting feminists began to form localized and nonhierarchical groups, assisted by the Free-Universities and the underground press. Feminists began to see the model of the liberal subject as the source of women's subordination rather than the answer to it. This new brand of feminism was radical: whereas liberal feminism was reformist and individualist, radical feminism was revolutionary and collective. As an activist movement, radical feminists aimed to gain equality for all women and used direct action to achieve this goal.

Radical feminists in the United States held rallies, protested at beauty pageants, and organized consciousness-raising events. The term *bra-burning*—although now acknowledged to be a derogatory media invention—originates from the destruction of equipment of female torture, such as stilettos, at the protest against the Miss America pageant in 1968. Out of this resurgence of feminist activism grew a new interest in theory, inspired by a commitment to social and cultural change, and fuelled by anger at what radical feminists considered to be the pervasiveness of male domination. In 1970, several key feminist texts, including Shulamith Firestone's *The Dialectic of Sex: The Case for Feminist Revolution* were published. In the late 1960s, Firestone set up the Women's Liberation Collective in Chicago and subsequently became involved with the New York Radical Feminists. Her involvement in activism directly informed her theory. In *The Dialectic*, Firestone argued that women's oppression predated that of either racial or economic oppression and that it stemmed from women's reproductive burden. She appealed by analogy to a Marxist model: only when women seize control of the means of reproduction will they be liberated. Firestone's feminist utopia is one in which reproductive technology eventually renders marriage, the family, and heterosexuality obsolete, along with cultural myths such as romance and motherhood.

Firestone's vision may seem far-fetched, yet the revolutionary aspect of *The Dialectic* lay not in its solution to the problem of women's oppression, but in its analysis of institutions such as marriage and the family, through which hegemonic male power is exercised. Kate Millett's *Sexual Politics* was also published in 1970: Millett's analysis was one of the first to use *patriarchy* as a term to describe the domination of all women by all men: "patriarchy is a governing ideology without a peer; . . . no other system has exercised such a complete control over its subjects" (Millett 1970, 33). Like Firestone, Millett argued that patriarchy's chief institution is the family. So long as women's primary role was for reproduction and child care, this justified their treatment as second-class citizens. In other words, the family is intrinsic to the operation of the patriarchal system. Patriarchy, Millett also argued, is the primary form of oppression from which other forms of oppression—racial and economic—logically follow.

In Britain, the women's liberation movement (WLM) gained pace largely as a result of women's involvement in, and subsequent disenchantment with, left-wing political bodies such as trade unions. Like their U.S. counterparts, British feminists became disillusioned by their male peers' failure to take women's issues seriously. Consequently, networks of local women's groups began to hold events designed to discuss women's experiences. This trend culminated in the first Women's Liberation Conference at Ruskin College, Oxford, in 1970. The conference was attended by over five hundred people. Delegates drew up four basic demands: equal pay, equal education, twenty-four-hour nurseries, and free contraception and abortion on demand. These demands were printed on a banner at the first International Women's Day march in 1971, for which 4,000 women marched through London. But unlike the suffrage campaigns of more than half a century earlier, the march (and subsequent political agitation) elicited much success in Britain. The Equal Pay Act was passed in 1970, followed by the Sex Discrimination Act (1975), and the Domestic Violence Act (1976). Grassroots activism proved to be a successful campaign tool throughout the 1970s.

In the United States, the divergent origins of the second wave came to the fore with the publication of Robin Morgan's anthology *Sisterhood Is Powerful* (1970). The anthology—the first of its kind—revealed the double burden of race and gender. Black women, many of them civil rights activists, had been involved in feminist activism from the beginning of the second wave; some, including Angela Davis (a black feminist and member of the Black Panthers), demanded that white feminists address problems of racism and elitism within the movement itself if they were to avoid alienating many black women. White feminists were accused of marginalizing the experiences of black women, as well as failing to address complex issues of race and class. In *Ain't I a Woman* (1981), American author and black feminist bell hooks gave a historical account of the interconnected issues of race, class, and gender from the suffrage movement to the seventies, detailing the ways in which racial stereotypes contributed to the exclusion of black women from the feminist movement. Hooks also argued that white feminists had ignored the fact that many black women worked long hours in low-paid jobs and wanted more time to spend with families. This view, which echoed that of early twentieth-century feminist Emma Goldman, conflicted with white feminists' argument that the family

was always the site of oppression that prohibited women from participation in the public sphere.

Although the UK movement drew its greatest impetus from socialist-Marxist politics, lesbian feminists were involved in activism (including the peace movement and environmental campaigns such as the Greenham Common peace camp) from the late 1960s, in both Britain and the United States. However, many radical feminists argued that the only solution to the destructive power of male sexuality was to reject heterosexuality altogether (see Dworkin 1981). This position gave rise to increasing numbers of lesbian separatists: women who chose relationships with other women as a political alternative to the patriarchal institution of heterosexuality. Also published in 1970 was lesbian feminism's most famous manifesto, "The Woman-Identified Woman," by the New York radical group Radicalesbians. The ten-paragraph polemic claimed that the key to women's liberation lay in women's relationships with other women. The lesbian, they argued, directly challenged traditional masculine notions of women's identity and sexuality. However, some feminists complained that this emphasis on separatism, and the rejection of heterosexuality altogether, amounted to an unacceptable policing of sexual desire. Friedan charged that such separatism was both unrealistic and self-defeating as a general strategy for women.

In Britain, two related strands of feminism began to emerge in the early 1970s: socialist feminism and psychoanalytical feminism. Juliet Mitchell, a psychoanalyst and socialist feminist, criticized radical feminists for their transhistorical, monocausal, and oversimplistic accounts of patriarchy. Mitchell published *Woman's Estate* in 1971, arguing that Marxism had failed to provide a materialist analysis of women's economic and social oppression, instead reducing it to class analysis. The search for an overarching feminist theory that tied together the internalization of patriarchal ideology described by Millett with accounts of women's disadvantaged economic and social position led Mitchell and others to use psychoanalytical theory as a tool for exposing unconscious forces by means of which sexual identities are created and sustained. Previously, many radical feminists, including Firestone and Millett, had rejected Freudian psychoanalysis as implicitly antifeminist. However, as earlier suggested by

the Frankfurt school of critical theory, psychoanalysis, together with a Marxist account of material forces, proved useful in theorizing a dual structure of oppression: capitalism, on one hand, and patriarchy, on the other. If capitalism was perpetuated through a system of production, then patriarchy was perpetuated by means of reproduction in which the family and heterosexuality function as intrinsic components of this system.

The contested relationship between production and reproduction was also the topic of Heidi Hartmann's "The Unhappy Marriage of Marxism and Feminism" (1979). During the 1970s, there was increasing tension between Marxist feminists and those who considered Marxism to be naïve about the extent of women's oppression. According to classical Marxism, the sexual division of labor would be eradicated once women entered the workforce: after the revolution, women would be liberated along with the proletariat. But as many feminists argued, not only did this account fail to acknowledge the unpaid work done by women in the home, but Marxist revolutions in several countries, notably the USSR and China, had failed to significantly improve women's position. According to Hartmann, attempts to integrate feminism within Marxism were damaging for feminism, as they tended to absorb women's experience into the wider class struggle. Some critics argued that the unified system posited by Marxists should be replaced, for the purposes of critique, by a more complex dual system described by Mitchell.

The renewed interest in psychoanalysis in the 1970s and 1980s produced several key feminist texts. Carole Pateman (1988), a British political theorist and feminist, argued that liberal contract theory from the time of John Locke (1632–1704) had concealed a tacit sexual contract between husband and wife, a contract that instilled natural male authority within the family. As the head of the household, the man represented the public sphere, while the woman represented the private. The exclusion of women from the public realm effectively barred them from full citizenship for which they were considered to be naturally ill-suited. In her essay "The Fraternal Social Contract"—a reply to Rousseau's (1712–78) *The Social Contract* (1762)—Pateman argued that Rousseau's vision was underpinned by Sigmund Freud's account of patricide in *Totem and Taboo*: the

agreement or contract between brothers prohibiting incest and legitimizing the exchange of women in the tribe.

By the 1980s, feminism had proliferated within the academy and had infiltrated most subject disciplines. But this academic trend coincided with the decline of feminist activism; the last WLM conference was held in 1978. Fissures within the movement had begun to show in the early 1970s. In the United States, disagreements between radical-lesbian feminists and liberal feminists, along with charges of racism and elitism from black feminists, suggested that identity politics had, perhaps, become internally self-defeating. Similarly in Britain, there were disagreements between working-class and middle-class feminists, between white and black, and between heterosexuals and lesbians-separatists. These disputes took place against the backdrop of an increasingly conservative society: Margaret Thatcher became the UK's first female prime minister in 1979 (although she was vocal about her antifeminist stance), with Republican president Ronald Reagan taking office in 1981. This concatenation of events, coupled with a media-induced backlash in the 1980s, meant that feminism became increasingly fragmented and less politically cohesive than in the 1970s. Indeed, for a variety of reasons, the term feminism itself never enjoyed majority support even among women, despite the fact that second-wave feminism eventually succeeded in winning over a majority of the general public to the general principle of equal rights for men and women.

Feminism in the Academy (1968–)

From the late 1960s onward, feminism continued to gain momentum within universities. The psychoanalytic theory of Jacques Lacan, the literary theory of Roland Barthes, and the philosophies of Jacques Derrida and Michel Foucault, have all been influential in the formation of new feminist philosophies. Postmodern critiques of philosophical systems of representation led feminist theorists to deconstruct the categories of sex and gender and to challenge the legitimacy of the philosophical self, which, they argued, has historically reflected the priorities and interests of men. Talk of patriarchy was replaced by explorations of the contingencies of gender. If one of the most important achievements of radical feminism was its challenge to the patriarchal value system that implicitly subjugates

femininity to masculinity, feminists working from within the academy have further sought to challenge the power structures that create and sustain gender identities.

The sex-gender distinction was initially theorized in the 1970s by Gayle Rubin (1975), and was useful for feminists because it separated biologically determined sex from socioculturally determined gender. Instead of behaviors and personalities being anatomically determined, Rubin suggested there are two sexes (male and female) and two genders (masculine and feminine). This distinction was liberating for feminists, as it helped to disprove the traditional theory that woman's nature is determined by her reproductive functions, instead suggesting there is no necessary continuity between the two.

The idea that society creates the differences between the sexes rather than biology was anteceded by Simone de Beauvoir in *The Second Sex* ([1949] 1997). Beauvoir's text was a foundational feminist tract, influencing many radical feminists of the 1970s, including Millett. However, Beauvoir was often contemptuous of female weakness and was criticized, like Friedan, for her desire for equality with men and her emphasis on individual responsibility. Nevertheless, the book contained two powerful insights: that woman has historically acted as man's other and that femininity is a sociohistorical construct, one is not born, rather one becomes, woman.

In the 1970s, Beauvoir directly influenced a new wave of feminist theorists, including Luce Irigaray, Hélène Cixous, and Julia Kristeva (see Moi 1985). The French feminists, as they came to be known, gained popularity in academic circles for their critique of phallocentrism. According to the psychoanalytical theory of Lacan, language is marked by a lack (the symbolic phallus) that represents the disunity of the individual who speaks. This lack comes to represent sexual difference, specifically the feminine. For feminists, the phallus represents the valorization of the masculine and the systematic subjugation of the feminine within the social realm. Phallocentrism has become a preferred term to patriarchy because it draws together poststructuralist accounts of the psychical development of the individual via his or her initiation into language, with the feminist idea that existing social structures reflect the imperatives of the masculine.

In the 1980s and 1990s, continued feminist engagement with psychoanalytic and poststructuralist theories further problematized the relationship between sex and gender. The American philosopher Judith Butler (1990), for example, argued that sex, gender, and sexuality are performative: the outcome of acts and behaviors habitually repeated over time. Thus, sex becomes indistinguishable from gender, as the way that we understand our bodies is also socially conditioned. Butler makes the body the point of focus as a site of potential revolution. However, the idea that woman was a socially constructed category faced feminists with a problem: if biology was not enough to bind women together as a political force—as all women would experience their bodies differently under different cultural conditions—what was? This question has continued to preoccupy feminists into the present day.

Third Wave Feminism (1990s–)

Since the 1990s, a new generation of younger feminists has emerged who explicitly acknowledge themselves to be part of a third wave of feminism, sometimes described as postfeminism because of its criticism of the feminist movement of the 1970s (although the term might be traced back to the antifeminist media backlash of the 1980s; see Faludi 1992). Indeed, third wavers are less likely to have as obvious political allegiances as the feminists of the 1960s and 1970s. However, it would be a mistake to suggest that third wave feminists are politically apathetic or that they reject all of the claims of radical feminism. Rather, most third wave feminisms are premised on a realization that many of the theoretical frameworks on which radical feminism (broadly conceived) was based were ones in which notions of sameness and universality eventually became untenable, as they tended to reflect the interests of white, middle-class women. These notions gave way to those of identity and difference and forced feminists to readdress the reality of bodily situatedness. New discourses surrounding the politics of globalization, hyper-capitalism, and environmental destruction have forced feminism to adapt itself to the changing social and political face of recent years and to respond constructively to questions raised by black feminists, lesbians, and queer theorists.

The interest of the third wave in the politics of globalization is manifest in ecofeminist perspectives. Ecofeminist theoretical frameworks find links between the domination of women and the domination of the natural world. The ecofeminist Val Plumwood identifies a standpoint of mastery at the heart of how women and nature are conceived and treated in Western capitalism, while the Indian philosopher and activist Vandana Shiva has developed a political ecofeminism that specifically explores the fate of women in subsistence economies. For Shiva, genetic engineering and mass farming are part of a masculine culture of dominance, the same culture of dominance that oppresses women. Although she has been subject to the charge of essentialism, for Shiva, environmental survival is linked to the survival of women and both must be premised on an egalitarian model of collaboration.

In the spirit of third wave interest in multiple identities and many voices, it is notable that prominent male academics such as Michael Kimmel have contributed to feminism in the academy. For many, men's identification with female struggles as feminist men is a positive and necessary development; however, describing men as feminists has remained controversial due to concerns that men cannot fully identify with women's struggle. The term *pro-feminist* male has developed as a middle ground to allow men to indicate support for feminist causes without co-opting the movement.

Third wave feminists are often interested in popular culture as a site that reflects social norms and values, but also as one that challenges them. Cultural feminisms blend postmodern analyses and identity politics with an ironic take on popular culture, frequently exalting figures from music, film, and television. Self-consciously and sometimes intentionally contradictory, cultural feminists embrace elements of second wave critique while also emphasizing the ways in which pleasure and desire might transform existing power structures. Heywood and Drake (1997) suggest that two strands might be identified: victim feminism and power feminism. Often, these two strands sit side-by-side, with third wavers recognizing and critiquing oppressive power structures while also defining themselves competitively against other women. Celebrities such as Courtney Love, Alanis Morissette, Madonna, and Lady Gaga, for example, have all

exploited the contradictory, yet realistic, idea of the modern woman as both vulnerable and powerful.

Power feminists have often attacked radical feminists' attitudes toward sex and sexuality as neopuritanical. American writer Naomi Wolf (1998) argues that women must reclaim their sexual identities as legitimate in the face of polarized attitudes toward women as whores or virgins. Similarly, others (e.g., Camille Paglia) have celebrated the empowering dimension of sexuality (particularly heterosexuality). This position could be read as a backlash against radical feminism's proclivity to a type of victim mentality in which all heterosexual sex is viewed as possession or domination. Thus, power feminists are often sex-positive: an emphasis on individual empowerment has meant that discussions surrounding pornography and sex work—as examples of sexual autonomy taken to their limit—have been reopened. Power feminism has, however, been criticized from several angles. Because of their emphasis on individual autonomy, it has been argued that power feminists return to a universalized concept of woman. Some critics also state that a preoccupation with sex, and the ironic pleasure taken in the objectification of women's bodies, makes it complicit in women's subordination and blind to culturally ingrained sexism. As American journalist Ariel Levy (2005) argues, many young women have been seduced by the media fantasy of the lipstick feminist, embracing the iconic Playboy bunny symbol, for example, as emblematic of the sexually empowered young woman.

The conflation of culture with politics has led to the accusation that third wave feminism lacks a clear political motive. However, many feminists now insist that political activism and cultural production are inseparable and that a continuing engagement with both academic feminism and popular culture is intrinsic to the third wave agenda. Importantly, some argue that if feminism is to continue to enhance the lives of women and men across the world, global feminisms must continue to engage with feminist theories from within the academy as well as to form political alliances. The recognition of local, multiple identities and perspectives is crucial to this vision, as is a critical engagement with the past.

Ferguson, Adam

Adam Ferguson (1723–1816), philosopher and historian, was born in Logierait, a Perthshire village bordering on the Scottish highlands. He was educated in St. Andrews and Edinburgh, served as military chaplain in a Scottish regiment posted on the Continent during the War of Austrian Succession, and took part in the Battle of Fontenoy in 1745. His subsequent political thought reflected a fruitful tension between Gaelic clan traditions, the commercial urban life of the Scottish lowlands, British current affairs, and the modern cosmopolitanism of the European Enlightenment.

In Edinburgh, Ferguson's interests shifted from theology to philosophy, and he joined a circle of young scholars that became the kernel of the Scottish Enlightenment, including David Hume and Adam Smith. Ferguson's nine-year military career, untypical of fellow Scottish thinkers, inspired his historical interest in ancient Rome, as well as his political interest in the military aspect of civic virtue, a touchstone of classical republicanism.

As part of the Edinburgh circle, Ferguson helped shape the cultural politics of a Scottish generation committed to Britain and its empire, yet developed a distinct Scottish take on the makings of modernity. Like Hume and Smith, Ferguson was fascinated by the psychological and social engines of the emerging market society. Evidently influenced by Montesquieu and Jean-Jacques Rousseau, he sought a new understanding of mankind's progress from savagery to politeness. On the other hand, he was more committed than Hume or Smith to local traditions of valor and led an unsuccessful

agitation for the establishment of a Scottish militia. Identifying civic commitment with military spirit, Ferguson formulated a key concern of modern republican thought: does modern commercial society trump classical political virtue? Will *homo economicus* outdo the public-minded citizen?

In 1767, holding a professorial chair at Edinburgh University, Ferguson published his masterpiece, *An Essay on the History of Civil Society*. The book portrays the material and moral progress of mankind, and of specific nations, from savagery and barbarism to commerce, refinement, and liberty. It is a philosophical history, beginning with a discussion of human nature and proceeding to analyze both the success and the failure of well-advanced societies.

The *Essay* aroused considerable interest upon its publication and was translated into French, German, and other languages. It became politically interesting again during the second half of the twentieth century. While its initial success reflected its role as an elegant contribution to the Enlightenment genre of philosophical history, its later significance is due to Ferguson's unique grappling with several key issues of current political and economic thought.

Ferguson was fascinated by the active exertions of the human mind, rejecting Hume's assumption that human motives can be reduced to the love of pleasure and the avoidance of pain. For Ferguson, the natural tendency to play, struggle, and pursuit kept men and societies in the best mental and political shape. He lauded the bonds of society that held primitive tribes and ancient republics together. Commercial and technological progress is a natural staple of human existence, and it coincides with moral and artistic advance, but such historical processes are not deterministic and rely on the active involvement of men in the public affairs of their polity. Sophisticated societies such as ancient Rome could decline and end up in corruption and political slavery, if the civic and military valor of their citizens slackened into self-indulgent laziness. In such societies, public spirit collapses into the private sphere. Neither commercial success nor good laws can make up for the disappearance of civic commitment.

Like other Scottish thinkers, Ferguson took up the notion of unintended consequences, showing how large and complex societies have grown from multiple self-seeking actions of numerous individuals. Yet unlike Smith, he did not trust the invisible hand to regulate self-interested individuals. He did not rest content with the inadvertent and amoral aspects of commercial modernity. Even rational government and good legislation cannot maintain civil bliss if men cease to be self-conscious, virtuous citizens. Similarly, the division of labor lauded by Hume and Smith was considered dangerous by Ferguson insofar as it compartmentalized human faculties into professional skills, made politics a specialization, and dissolved the well-rounded civic personality.

Ferguson went on to write two philosophical works and a successful history of ancient Rome. A brief diplomatic career brought him to America as a member of the Carlisle Commission (1778), in a failed British attempt to negotiate with the rebels.

But the *Essay* remained his grand opus. Ferguson's keen interest in the mechanisms of ancient and modern societies made him a pioneer of political sociology. The concept of civil society that his book helped disseminate is of increasing interest to theorists today. By holding active citizenship to be indispensable and by doubting an obsessive reliance on either law or the economic invisible hand, Ferguson heralded the ethical demands that many thinkers still wish to make to the modern individual and state.

Feuerbach, Ludwig

Feuerbach, Ludwig

Ludwig Feuerbach (1804–72) was one of the most important of the Young Hegelians, the radical followers of Georg Wilhelm Friedrich Hegel. Feuerbach is best known as an antireligious materialist philosopher, not as a political thinker. His thought, however, carried important political implications, and it deeply influenced Karl Marx and Friedrich Engels.

Feuerbach was born into the family of P. J. A von Feuerbach, a prominent jurist and legal reformer in Bavaria. Feuerbach began university studies at Heidelberg, but transferred to Berlin in 1824. There, he fell under Hegel's spell and completed a dissertation titled *Of Reason, One, Universal and Infinite* in 1828. He taught at Erlangen, but was dismissed when he was revealed to be the author of *Thoughts on Death and Immortality*, an irreverent critique of the Christian doctrine of personal immortality published anonymously in 1830. He never held an academic position subsequently. In the 1830s, he published a number of historically informed studies of past philosophers that reveal his increasingly radical ideas about religion. He also grew more critical of Hegel's thought. In an important article of 1839, he criticized Hegelian idealism in the name of materialism and rejected Hegel's assertion that his philosophy expressed absolute knowledge. The dialectic, Feuerbach now insisted, is open-ended and dynamic, meaning that all cultural, political, and philosophical forms must yield to progressively new forms. The 1841 publication of his major work, *The Essence of Christianity*, made him perhaps the most famous philosopher of the 1840s and certainly the most controversial.

The book's famous claim is that anthropology is the secret of religion. That is, religion has no truth in itself; its truth lies in its relationship to human needs and wishes. The divine being is nothing more than a projection of human attributes, which taken as a whole Feuerbach called species-being. However, people do not recognize god as their own creation, nor do they realize that in worshipping god, they are in fact worshipping their own best qualities. Religion thus involves a crucial element of alienation because humans imagine themselves to be subject to an all-powerful, transcendent god. Despite his criticisms of Hegel, *The Essence of Christianity* retains a Hegelian framework insofar as Feuerbach believed that the development of human consciousness would lead humans to recognize themselves as the creator of god and through this recognition, they would regain the attributes they had projected onto god. In the mid-1840s, Feuerbach published numerous works defending and extending the fundamental theses of his masterwork, especially in the direction of a comprehensive materialist philosophy. Feuerbach remained a prolific writer throughout the rest of his life, but the 1840s were clearly the years of his greatest creativity and impact.

In the decades between the defeat of Napoleon in 1815 and the Revolutions of 1848, Christianity played an important ideological role for the German monarchies, striving to reassert their legitimacy in the wake of the French Revolution. Consequently, Young Hegelian attacks on Christianity presented directly political challenges to these regimes. Feuerbach believed that his philosophy directly supported an egalitarian republican and even socialist politics because he sought to expose the origins of hierarchy—both this-worldly and heavenly—in a false projection of qualities that were, in truth, shared by all humanity. On this basis, Feuerbach was invited to deliver lectures on Christianity in Frankfurt at the height of the revolutionary upheavals of 1848. Likewise, the young Marx believed that Feuerbach had created the philosophical basis of communism. Certainly, Feuerbach profoundly influenced Marx. Marx's first writings about civil society, developed in writings about Hegel's idealist philosophy of the state, borrowed from Feuerbach's model of religion: where Feuerbach sought to return the heavens to earth, Marx argued that the state, which Hegel had described as God on earth, actually originates in the real relations of people within society. Further, as Marx embarked on his lifelong critique of

capitalism, Feuerbach's account of religious alienation provided a template for describing the alienation suffered by workers within capitalist relations of production. Though Marx and Engels both grew critical of Feuerbach, the Feuerbachian theory of alienation remained a persistent element in the deep structure of their thinking.

Fichte, Johann Gottlieb

Fichte, Johann Gottlieb

A leading figure in idealism and romanticism in Germany at the end of the eighteenth century, Johann Gottlieb Fichte (1762–1814) was an innovative and influential political thinker as well. The central thesis of his political thought was that the social-political world is not a realm in which individuals seek to realize their already formed interests; rather, that this world is constitutive of the identities as well as interests of individuals. This thesis became a centerpiece of Georg Wilhelm Friedrich Hegel's social and political thought and the subsequent political theory traditions that follow Hegel. Moreover, Fichte was one of the first political theorists to offer a systematic treatment of the welfare state, embodying his concern for material equality for all. In an oft-criticized yet influential later work, Fichte considered a shared national or cultural identity as equally fundamental to the formation of a society.

Fichte presented his political views in a number of different kinds of writings, but above all in his *Rectification of the Public's Judgment of the French Revolution* (1793–94), *Foundations of Natural Right* (1796–97), *The Closed Commercial State* (1800), and *Addresses to the German Nation* (1807–08). The first book was essentially a monograph devoted to the vindication of the right of revolution, earning Fichte the label Jacobin in his own time. *Foundations of Natural Right*, on the other hand, was a comprehensive treatise that included a deduction of individual rights and a discussion of the first principles upon which political authority is to be built, the tenets of parenting and education in the family, public finance,

criminal justice, and inter-societal relations. It was in the *Foundations* that Fichte systematically formulated his thesis that true self-awareness is possible only through social interaction. *The Closed Commercial State* had a narrower scope as it focused on the public regulation of the economy, developing ideas already stated in the *Foundations*. The last and most controversial of these works, *Addresses to the German Nation*, was concerned with the cultural or national unity of a people rather than with narrowly political questions of legitimacy and public policy.

Although these works differed in their focus and style of argumentation, they all dealt with a particular aspect or manifestation of human freedom in the social and political world. Fichte's early work on the French Revolution focused on the political implications of moral autonomy that he defined in reference to Immanuel Kant. The *Foundations* and *Closed Commercial State*, on the other hand, were concerned with the regulation and balancing of individual liberties or rights regardless of their moral status. Finally, the *Addresses* dealt with the conditions of collective or national freedom and in particular, with how a nation can achieve self-sufficiency in its language and culture, as well as in its political and economic institutions.

The emphasis on freedom in all these works was no accident but derived from the unifying and legitimating supposition of his entire philosophy; namely, that all intentional deeds of human beings, and the concepts or maxims that systematically guide such deeds, stem from the self-constitutive or self-positing acts of human consciousness. Fichte believed that this supposition would help to construct a unified and coherent account of the human being because self-positing mental acts make possible not only the scientific or theoretical activities (such as logic and the natural sciences) that human beings undertake, but also their decisions and actions in the social and political world. Relatedly, Fichte not only intended his own work for academic consumption, but also hoped its reading would help ordinary human beings to achieve self-awareness.

However, Fichte scholarship is divided on how exactly Fichte construed the unity of his philosophy. This question arises in part because Fichte called for a separation of legal theory from moral theory. In addition, parts of Fichte's political thought, such as those concerning the tasks of political

government and what establishes social cohesion, appear to have changed over time. Critics, ever since Hegel, have argued that Fichte's political thought is neither internally coherent nor in harmony with his other works. More charitable interpreters, by contrast, maintain that Fichte's entire philosophy, including his political and moral theory, is constructed around some core principles, such as the idea of self-positing and the rules of inference despite the apparent discontinuities in that body of work.

Whatever the outcome of this debate, Fichte's political thought could suitably be regarded as part of European political theory traditions (such as those of republicanism and social contract theory) that take freedom to be the organizing principle of social and political order. Further, due to their emphasis on both individual and collective forms of freedom and on central government, Fichte's political writings continue to inspire political theorists who seek to reconcile individual and collective rights.

Foucault, Michel

Michel Foucault (1926–84) was one of the most important European thinkers of the twentieth century. Born in Poitiers, France, Foucault is often regarded as the epitome of the Parisian intellectual at the center of public life in France in the decades after World War II. However, his intellectual influence, both in life and in death, extended well beyond France.

Foucault's work defies easy categorization. It focused on a wide range of topics, including the character of literary texts; the philosophy of knowledge; the nature of power; the history of madness, medicine, and psychology; the variety of forms of punishment and discipline in the modern world; and the history of sexuality from ancient Greece to psychoanalysis. Foucault's writing moves seamlessly across a number of different disciplinary boundaries, most notably between philosophy and history. Since his death, however, he has increasingly come to be seen as an important political theorist in his own right.

The significance of Foucault's work for contemporary political thought lies in three main areas. First, his understanding of power in general brings into question the established view of power in modern political theory as an essentially negative phenomenon and the medium of domination. While his earlier work tended to assume that power was repressive in nature, from the mid-1970s he came to a clearer view of the productive aspect of power. Exercises of power often create new forms of knowledge and practice that alter the (self-)identity of subjects. The outcome of particular instances of the exercise of power is always uncertain and open, to the extent that the

dominant position of powerful agents in the relation can be undermined by their own conduct. Thus, in every power relation, there is the possibility of resistance and transformation. Nonetheless, Foucault claimed that the understanding of power in the abstract as either a negative or a positive phenomenon was, in itself, of little interest. Rather, the analysis of power must focus on concrete power relations as they appear in particular historical and social contexts.

Second, and following from this situationally anchored perspective, his later work turned to the question of the various forms of power relations that have shaped political, legal, and economic practices in Western modernity. Key in his approach is the concept of sovereignty. In early modern Europe, the idea of sovereignty was used to legitimize royal absolutism, attributing a plenitude of power to the sovereign as the unquestioned source of authority in a territory. Yet Foucault argues that modern political and legal theory, in accepting the notion of the sovereign exercising a plenitude of power, has been blind to those relations of power that have formed outside of the purview of the sovereign and that have been key in shaping the character of modernity. Such relations of power operate on a microlevel, disciplining individual bodies according to forms of knowledge intended to achieve the effective employment of human labor and resources. Thus, the Benthamite notion of the panopticon, which emerges from the utilitarian imperative for the most efficient organization of social and economic relations possible, is embodied in a system of surveillance that ensures the regimentation and routinization of individual conduct in institutions such as prisons, factories, hospitals, asylums, and schools. Foucault's concept of biopower, in contrast, captures the idea of a form of power relations intertwined with the government of the population of a territory as a whole. Thus, scientific and social-scientific knowledge and practice concerned with public health, rates of fertility, morbidity and mortality, social risk, and security come to play a central role in modern societies, particularly with the advent of the welfare state from the late nineteenth century.

Third, Foucault's reflections on these various forms of power relations brought to the fore the question of government, or the supervision of people's conduct. Government, in this sense, is much broader than the activities of the executive agents of the state. The term *governmentality* was

coined by Foucault to capture the sense in which government in modern societies operates as a pervasive form of rationality or an array of techniques for shaping the conduct of citizens. Modern government of conduct is not simply a matter of power shaping subjects through external impediments or inducements, but rather, as suggested by Sigmund Freud's concept of the superego, the self-government of individuals to meet internally formulated ends. The importance of self-government is clear in Foucault's last works on the care of the self, but it is also evident in his concerns with the rise of neoliberalism and the conception of individual responsibility for the self as both moral and economic actor.

Fourier, Charles

Charles Fourier (1771–1837) was the first influential French communitarian socialist. He produced the most damning critique of contemporary society and proposed the most radical reform of any thinker in the early nineteenth century.

Life and Works

Fourier was born into a prosperous merchant family in Besançon and earned his living, reluctantly, in the same trade in Lyon, unable to devote himself entirely to writing until a few years before his death. Between 1808 and 1827, he wrote four substantial books in which he expounded his theory of how society could advance from the social conflict of his day to harmony. The first, *Théorie des Quatre Mouvements et destinées générales*, was published anonymously in Besançon in 1808 (1967) in two volumes. His next major work, *Traité de l'association domestique agricole*, appeared in Paris in 1822, also in two volumes. He brought out a third single-volume book, *Le Nouveau monde industriel et sociétaire, ou invention du procédé, d'industrie attrayante et naturelle distribuée en séries passionnées*, in 1829 (1973). In 1835 to 1836 came his last work, *La fausse industrie morcelée*. All stated the same basic criticism of society and his unique solutions.

In addition, Fourier wrote many long articles on the same themes, some of which were published in the early 1830s in the Fourierist journals edited by

his followers, but most did not appear in his lifetime. The journals themselves were forced out of production mainly by the dead weight of Fourier's prose. A fourteen-page summary of his ideas, *Political Economy Made Easy*, was published in London in 1828 by the London Cooperative Society, probably translated by the Owenite William Thompson.

Until his ideas were taken up by Victor Considérant in 1832, at most fifty devoted acolytes in Besançon had read his works, even though he always sent copies to leading politicians. This was not because of the content; he was innovative, imaginative, and sometimes very funny. What he proposed was an economic and sexual revolution, shocking for a society brought up on liberal economics, the Roman Catholic Church, and monogamous marriage. The eroticism of his *Nouveau monde amoureux* so shocked his followers that it was never published at the time and was even left out of his collected works in 1966. It did not appear in print until a year later, with a second edition in 1990.

Unfortunately for sales of his books, Fourier favored nonsequential pagination and semimathematical symbols and arguments. He invented words, without explanation or warning, which, then as now, confuse even those whose first language is French. His text would switch randomly between Roman and Arabic numerals and a variety of typefaces, and letters might appear upside down or lying on their sides, as if some demon had shuffled and rearranged the text. His books read like the minutes of a secret society or the endless stream of consciousness outpourings of an unconscious mind. His greatest vice was verbose repetition. Some of his ideas are hilarious, although a reader is never sure which inventions he intended to be a joke. He claimed that planets have aromas for long-distance copulation. He argued that the earth was sick, that its climate was deteriorating, the ice-caps melting—claims that have resonance today—but Fourier went on to write that there was a rescue column of 102 planets moving toward the earth. In harmony, all the seas would turn to pink lemonade. All this imaginative, romantic hyperbole may have been just fun for Fourier, but his readers are still never quite sure, and those who mention the humor are liable to be castigated for belittling this autodidact.

A Program for Harmony

Nevertheless, Fourier's condemnation of capitalism and existing family norms was devastating. His solutions wake up the most torpor-laden undergraduate audience today. Having lived through the repeated upheavals that followed the 1789 Revolution and the bloody Terror of 1793 to 1794, Fourier was convinced that the social crisis of the early nineteenth century was all in the mind. Human misery existed, not because of economic inequalities, but because the human psyche was inhibited by traditional social norms. When these constraints were removed, people would instantly live in harmony, without the need for police, courts of law, or repressive moral codes. Like many contemporaries, he believed that human society was progressive, but that there were backward as well as forward steps in social evolution. He started from the premise that there were laws governing social relationships parallel to those in the physical world described by Isaac Newton and others. Once the science of social relations was understood—and he was the good fairy to explain it—and changes implemented, all the ills would melt away. Fourier believed that humans living in equilibrium with their natures would be totally happy and content. He blamed the social problems of his day on capitalism and marriage. Both institutions, he argued, were contrary to nature. No reform of society would work until the worst evil, the lowly status of women, was addressed.

Fourier's solution was to create new, ideal communities. He was by no means the first utopian. The concept had long been familiar. Like most utopians, he argued that his scheme was essentially scientific and could be achieved peacefully, without conflict, and for Fourier, with no attention to a divinity. He proposed *phalanges*—experimental, self-governing, share-holding, profit-sharing communal democracies. Each would consist of 1,620 people. Citizens would be carefully chosen to represent a perfect balance of combinations of the three hundred passions that existed in varying proportions in all humans. Psychological harmony in the commune was fundamental. Fourier was well ahead of his time in emphasizing such concepts. Passional equilibrium would be accompanied by economic satisfaction, but unlike other utopian socialists, such as Etienne Cabet, Fourier did not consider humans required financial equality to be content.

The phalange would be privately owned. The property and buildings would be provided by an individual or group. The original owners or investors

would maintain their property rights and receive a dividend from the profits each year. The rest of the profits would be shared in a fixed ratio between all the members, with a percentage reserved for mutual aid needs and reinvestment. Fourier always emphasized the economic viability of his proposal and always hoped to convince an investor. Economies of scale would flow from communal production. The members would hold daily meetings to agree on agricultural and industrial targets and set up communal work teams. Work would be unalloyed joy. All members would be entirely content because they would decide what to do, and work would be subdivided so that everyone changed their activity each hour. The communal organization would avoid middlemen and speculators, who for Fourier were economic parasites, the most harmful aspects of emerging capitalism. Economic and social inequalities would remain, but Fourier argued that class and financial differences would be irrelevant if everyone was achieving their potential.

The architectural design of the phalange was paramount to counteract individualism and promote cooperation. Specially designed communal buildings would be constructed for everything from eating to attending the opera, and especially, for sex. Ironically, surviving designs show a strong monastic influence on phalange architecture. Sleep was the only solitary function, taking place between 10:30 pm and 3:30 am. Fourier was convinced that this amount of sleep was adequate when people were happy. All other activities were communal. There would be no marriage. Sexual relations would be temporary, fluid, allow for experimentation, and therefore, happy; all jealousy, dishonesty, and tensions would evaporate. Gender variations would be accommodated, and the elderly would not be excluded from sexual pleasures. Older, more experienced members would offer altruistic sex experience. Sex would be fun for all, with traditional moral constraints removed. Meals, prepared and eaten communally, would provide gastronomic delights five times daily. Cookery competitions would be a high point in the social calendar. Women would have the opportunity to contribute to the work of the phalange according to their abilities and inclinations.

Education was central to Fourier's new world, as it was to most of the reformers of his day. He believed that education should be primarily

vocational and should not be confined to a classroom. Very different from other reform programs, it was predicated on two revolutionary premises, communal rearing and equal opportunities, regardless of class or gender. Although natural mothers could spend time with *nourrissons* (children from birth until 18 months), the children would be reared not by their natural mothers, as Jean-Jacques Rousseau had demanded, but by professional care givers (mostly women) who were psychologically suited to the work (mostly women). A system of communal nursemaids would be economical because mothers would be free to work. Men would feel paternal affection for the children of all their sexual partners. The phalange would accept responsibility for children until they were three years old; then, Fourier imagined, children would be economically self-supporting. At four, when they were likely to be nothing of the sort, he named them *chérubins*, and at six and a half, and even less probable, they became *séraphins*.

From the middle of their second year, children would learn to use tiny hammers. At three, they would be placed in special workshops, enjoying very simple tasks such as grading peas by size and gradually increasing their range of activities. Even a bachelor philosopher recognized that although children of this age liked getting involved, they were masters of *furetage* (messing about) and delighted in breaking things. They were also possessed of *singerie*, the ability to imitate, which made them able to learn simple practical jobs very young. Their best teachers at first would be slightly older children, an approach similar to that used in the Lancaster system in England, in which adults taught superior students (monitors), who in turn taught the weaker students. Children would be grouped in *petites hordes*, those who enjoyed rough and tumble and loved to be dirty, and *petites bandes*, those who like to stay neat and clean. The former would undertake some of the cleaning and dirty jobs. Fourier admitted that there was often likely to be a gender difference between the two. When they were old enough, children would work alongside adults. Fourier expected considerable benefits from fathers and sons working together. Schoolwork would not be introduced until a child had acquired a range of practical skills; otherwise, he warned, children would regard a book as a prison.

There would be no call for moral education because Fourier believed that the complete liberation of the passions would guarantee that everyone

would be satisfied and happy. Stripped of their odd language and daft ideas that children of three could support themselves by work, Fourier's ideas on education were radical, but sensible, and aspects certainly recur in later educational theory. However, because most of Fourier's language was so obscure, his theories on education did not have much publicity until after 1831, and then the Fourierists developed them out of all recognition, promoting reform schools for young offenders—a sad and ironic outcome, given Fourier's confidence that punishment and moral condemnation would be irrelevant in his phalange.

Fourier's Sources and Influence

Fourier always claimed that his ideas were unique and as valuable as those of Newton and that his thought owed nothing to earlier writers. This claim was obviously unfounded. He knew of Robert Owen's New Lanark experiment, but believed that he had much to teach Owen and nothing to learn. He sent Owen copies of his books. They met only briefly in Paris in 1837 just before Fourier's death. He had no contact with Cabet, who shortly after Fourier's death invented a very different utopian community, Icarie. For a man who dreamed of intense human sociability, Fourier was a loner intellectually and personally. He never married and had virtually no friends.

Fourier might have died with his ideas unknown, until, by chance, they came to the attention of Henri de Saint-Simon and made a considerable impression on his followers, the Saint-Simonians. They adopted some of his ideas on the liberation of workers and women, but in November 1831, the majority disagreed so violently with a call for trial marriage from their self-imposed leader (Prosper Enfantin) that they broke away to align themselves in a Fourierist school. The dominant figure was Victor Considérant, who learned of Fourier's theories when lodging as a high school student with Fourier's devoted disciple, Clarisse Vigoureux, a rich widow. Fourier's theories were radically toned down by his new followers. Influential women members ensured that marriage and a thoroughly Christian God became cornerstones of a moral, not a natural, social order. Fourier had always claimed that his dream world was an economically viable program. The Fourierists tried to make it work. Two doctors donated an estate, and an experimental phalange was opened at Condé-sur-Vesgre, near Paris, in

1832, but Fourier had no faith in it, and it collapsed within a year. A Fourierist commune was set up in Rumania in 1835, but it too was short lived.

In the 1830s, the Fourierists in France abandoned privately financed communes and began to focus on state-run public works programs. They campaigned for the recognition of the state's obligation to organize work for the jobless and for the idea that everyone had a right to work. Fourierist socialist theory flowed from the pen of Considérant and others in books, pamphlets, a periodical that began life as *Le Phalanstère* (1832–49), financed by Vigoureux and edited by Considérant, and the newspaper *La Démocratie Pacifique* (1843–51). Fourierist ideas diverged so far from those of Fourier that disciples and master were frequently at odds. After their failure to promote socialist reforms in the Second Republic Considérant and Vigoureux, and indeed Cabet (but separately) participated in experimental communes. Thirty-five experimental phalanges ran for several years in America, and there were brief attempts in Australia.

Some early feminists such as Flora Tristan welcomed Fourier's ideas, but other early socialists were confused by Fourier's eroticism, his humor, and his imaginings. Karl Marx and Friedrich Engels focused on Fourier as a critic of capitalism and an advocate of producer cooperatives. Fourier was rediscovered in the 1960s by the women's liberation movement. An American scholar, Jonathan Beecher, wrote two substantial biographies, the first on Fourier, the next on Considérant. In 1990, an Association des études fourieristes was founded, with a journal, *Cahiers Charles Fourier*, which runs a well-organized website in which both Fourier and the Fourierists are honored.

Franco, Francisco

Francisco Franco Bahamonde (1892–1975) was a Spanish military officer who participated in the military rebellion that sparked the Spanish Civil War in 1936 and, emerged as the country's dictator at the war's conclusion in 1939, a position he held until his death in 1975. Franco's birth into a modest middle-class naval family in the coastal city of El Ferrol prefigured a military career, but there was little to foretell his political ascent to become the central figure of twentieth-century Spanish history. Unlike the Italian fascist Benito Mussolini or the Cuban communist Fidel Castro, two dictators with whom he is frequently compared, the young Franco did not appear to harbor any particular political ambition or develop some ideological vision. In fact, Franco never developed a full-fledged political ideology, and the justification of his regime morphed over time to keep him in power.

In 1907, Franco enrolled at the Military Academy of Toledo, graduating in 1910. Although a mediocre student, he advanced rapidly through the ranks of the officer corps in the army of the Spanish colonial protectorate of Morocco, reaching the rank of brigadier general by 1926. Franco became lieutenant commander of the Spanish Foreign Legion, a corps of shock troops founded in 1920. There he gained considerable prestige from his success recovering Moroccan territories Spain had lost in earlier defeats. The Foreign Legion is where Franco developed his core ideology: a strong military-nationalist ethos that regarded the military as the highest embodiment of the nation's values and strength.

When the downfall of King Alfonso XIII in 1931 swept in the left-liberal Second Republic, Franco displayed both loyalty and hostility to the new regime. He reacted bitterly to its decision in July 1931 to close the Military Academy of Zaragoza, a bastion of neoimperialist and conservative politics where he had served as director since 1928. Franco had never been enthusiastic about constitutional monarchy, let alone republicanism, but he declined to participate in a failed military coup attempt in 1932. Though Franco kept at arm's length from politics, his burgeoning Catholic faith and increasing contempt for communism added a new aspect to his hitherto one-dimensional brand of military patriotism. In October 1934, Franco led national forces to Asturias to suppress a revolutionary miners' insurrection, an operation that established him as Spain's preeminent military figure.

Like many conservative Catholics and a small but growing number of followers of the fascistic Falange party, Franco was convinced the forces of international communism were bringing Spain to the brink of a revolution. Increasing rural unrest and urban street violence in early 1936 appeared to confirm this suspicion. A group of Spanish officers stationed in Morocco had begun conspiring to impose military order. Though Franco was reluctant to commit, he acted to secure support from Adolf Hitler, Mussolini, and the Falange in the event of an uprising. He courted such support less out of ideological affinity than because of his awareness that these groups would be most eager to support a military revolt against a democratic regime.

The military rebellion that began in Spanish Morocco on July 17, 1936, defined no clear ideological agenda beyond establishing a "Spanish and Catholic" national movement. By October 1, as the rebellion transformed into a full-fledged civil war, the rebel military leadership made Franco supreme leader of the rebel zone. Franco cultivated a Manichaean view of the conflict that appeared to justify the brutality of his army's methods and the growing sympathy for Hitler's New Order among his advisors. Following his victory in 1939, Franco converted the Falange into the National Movement, the single official party of the new, quasi-totalitarian state. Franco had hoped to exploit his alliance with Hitler's Germany to rehabilitate Spain and expand its colonial position in North Africa, but terms with Hitler could never be reached. As the tide of World War II

turned against Germany in 1942, Franco distanced his regime. He reduced the influence of the National Movement, gave succor to thousands of Jews fleeing German captors, and ended the brutal post-civil war repression in which at least 50,000 pro-republican prisoners were executed (possibly many more).

Franco was, along with António Salazar of Portugal, Europe's only noncommunist dictator to survive World War II. After 1945, he redefined his regime as a monarchy and an organic democracy, though no dynastic succession was specified nor were arrangements made for any real popular representation. Franco's Spain endured isolation through 1953 when the emerging international alignment of the Cold War made possible tighter alignment with the United States and the Western European nations. Although Franco would remain Caudillo (leader) until his death in 1975, his regime evolved into a kind of limited-pluralist authoritarianism tolerant of political debate as long as it did not question the regime's legitimacy. In 1969, Franco chose Don Juan Carlos de Borbón, the grandson of Alfonso XIII, as his successor.

Frankfurt School

The Frankfurt school is a term applied retrospectively in the 1960s to describe the group of thinkers associated with the Institute for Social Research founded in Frankfurt in 1923 and later moved to Geneva (1933), New York (1935), and Los Angeles (1941), before returning to Frankfurt (1953). Their approach came to be known as critical theory. Much controversy surrounds the term *Frankfurt school*. Some consider it misleading, as it implies an artificial coherence to their work, ignoring the divisions and disagreements among them. It also raises issues of how we can decide who should be considered members of the school and who not. While keeping these caveats in mind, however, we can begin to outline some of the main features that applied specifically to its first phase, from 1923 to 1933. The first is that it had an institutional structure derived from the Institute of Social Research. The second was the role of the philosopher, sociologist, and social psychologist Max Horkheimer as a pivotal figure for introducing and furthering the theoretical basis of the school's work and for acting as its coordinator. The third relates to having an original manifesto that was encapsulated in Horkheimer's 1931 inaugural lecture, *The Present State of Social Philosophy and the Tasks Facing an Institute of Social Research*. Fourth, critical theory created a new paradigm with which to understand and critique society, as the combination of philosophy, social science, and psychoanalysis was a distinctive aspect of the school throughout its history. The fifth and final feature was an academic outlet for the school's work, the *Journal of Social Research*.

Origins

Felix Weil, the son of a wealthy businessman, set up the Institute for Social Research in Frankfurt in 1923. The institute was affiliated with the University of Frankfurt, but Weil's wealth ensured that it retained a large degree of autonomy in its operations. Between 1923 and 1929, the institute was directed by Carl Grünberg, who had been professor in law and political economy at the University of Vienna, and now became the first Marxist professor at a German university. He founded and edited the first publication of the institute, the *Archive for the History of Socialism and the Labour Movement*, also known as *Grünberg's Archive*, and he was instrumental in bringing together a number of committed scholars, notably the student of literature and popular culture Leo Lowenthal and the economist and national-planning specialist Friedrich Pollock. As Marxism was the guiding thread of the institute's activities and research, links were also established with the Marx-Engels Institute in Moscow, resulting in the joint publication of the first volume of the complete works of Karl Marx and Friedrich Engels.

The Marxist framework within which the institute would operate was affirmed with Grünberg's inaugural address in 1924, which attacked the way German universities were educating students to think uncritically about the world and instead to act as conduits for the preservation of existing power relations. Marxism as a method of scientific research and a philosophical system was tasked to unmask this process by subjecting social life in all its formations to a thoroughgoing critique. To do so meant deciphering the underlying laws that govern society at any particular time and recognizing that the categories used to understand them are not universal truths but fluid conceptions that can be used to comprehend the dynamic and varying forms of economy and society. To some extent, therefore, Grünberg was implicitly criticizing the determinism of the Marxism of the Second International. This criticism of orthodox Marxism along with the use of Marx's political economy would become distinctive aspects of the school's development, emphasizing historically based empirical research. In emphasizing economic causality and in positing a natural progression for social institutions to actualize themselves, Grünberg sometimes slipped back into a form of determinism. Despite his vital role, it

was with the advent of Horkheimer's directorship in 1930 that the school came into its own.

Further Developments

Horkheimer helped give the Frankfurt school its distinctive identity by the introduction of new scholars to the institute, such as the psychoanalyst and social psychologist Erich Fromm; the philosopher and literary critic Walter Benjamin; the philosopher, sociologist, and musicologist Theodor Adorno; and the philosopher Herbert Marcuse. These are the key theorists of the first generation of the school. The second generation is exemplified by the philosopher and sociologist Jürgen Habermas and the philosopher and social theorist Axel Honneth, both of whom carried on the tradition of critical theory but took it in new directions.

Horkheimer's inaugural address, delivered in 1931, *The Present Situation of Social Philosophy and the Tasks of an Institute of Social Research*, attempted to offer an overriding framework within which the research of the school should be undertaken. While continuing to stress the connection of theory and practice, Horkheimer suggested a number of changes to what research the school should become concerned with. In particular, he attacked philosophy for remaining within the abstract realm of theory in its treatment of the individual's relation to society. For Horkheimer, philosophy in general was ahistorical and understood individuals as being abstract and isolated, as in the case of existentialism, or submerged in a hypothetical social totality, as in Hegelian idealism, rather than socially and historically rooted in the life and culture of the society and time they happen to live in. He argued instead for an interdisciplinary approach across the social sciences and the humanities that would dialectically unite theory with practice and reformulate philosophical problems in more precise and empirical ways. On the other hand, Horkheimer also critiqued orthodox Marxism for its overemphasis on economics. He suggested a more complex understanding of the interrelations of economy, society, and psychology. In short, it was necessary to explore all aspects of cultural life and their dynamic interactions.

Under the auspices of this research strategy, the institute developed a number of overriding concerns that had to be investigated for a more critical understanding of society in the hope of its transformation away from oppression and domination. These were developed between 1930 and 1944 against the backdrop of the development of fascism and Nazism, which raised the question of their widespread appeal among the masses and of why had there not been a more coherent response against them by the official labor movements of Europe. Linked to these questions was the need to investigate the general development of authoritarianism present, not just in fascism, but also in the administered world of capitalism with its increasingly bureaucratic institutions and its tendency to fall into crises. Culture had to be analyzed to assess whether it had become primarily a form of ideological manipulation and control. The institute subjected the family to a new critique as a nexus of these psychological, cultural, and political phenomena. Finally, Marxism was reevaluated across a number of themes, most notably regarding what groups could become the most likely agents of social change in light of the Soviet experience. Such broad areas of investigation gave some coherence to the school, despite different emphases by different thinkers. The most prominent theorists within the school, Horkheimer, Adorno, and Marcuse, did touch on all these themes in some way in their work.

Exile

The enforced exile of the institute due to the rise of Nazism, and its relocation first to Geneva and then to the United States, had important implications for the school itself. The research strategy developed by Horkheimer was no longer appropriate to the situation the displaced members of the school now found themselves in, and planned projects had to be abandoned. In addition, Horkheimer's edict on the importance of uniting theory with practice was undermined by a split between works on social theory and philosophy and empirical studies. This split was particularly evident in the contrast between Horkheimer and Adorno's largely theoretical *Dialectic of Enlightenment* and the more empirically based research of the institute in Adorno and colleagues' *The Authoritarian Personality*, which investigated the roots of the psychological appeal of Nazism. Furthermore, the institute's research was being affected by the

academic culture of social science in the United States, which was dominated by uncritical empiricism, ahistoricism, and optimism. However, this difference also had the positive effect, especially for writers such as Adorno, of sharpening the critique of society and the methods with which to analyze it.

A particular challenge of working in the United States was the effect of the conservative political climate on the institute's funding, with threats of harassment and deportation leading the institute to tone down its publications in order to disguise their radical import.

Return

The institute's return to Germany in 1953 saw Horkheimer appointed as rector of the University of Frankfurt and Adorno as a professor before becoming a codirector in 1955. Fromm had left the institute in 1939, and Marcuse elected to remain in the United States. The institute also published a series of publications under the title *Frankfurt Contributions to Sociology* to replace the earlier *Journal for Social Research*. Horkheimer, up to his retirement in 1958 and death in 1973, and more importantly, Adorno, up to his death in 1969, were the main focus of the school's activities. Although the institute continued after their demise, it is generally thought that the school itself did not. However, the importance of the school was reflected in the work of Marcuse and the popularization of the name Frankfurt school during the radicalism of the 1960s and early 1970s. Finally, some have also seen the tradition of the school being carried on by Habermas, who had studied under Adorno and Horkheimer before taking over the latter's chair in 1964. Axel Honneth, who studied under Habermas, took over as director of the institute in 2001.

Main Theorists

As we have seen, Horkheimer was pivotal in giving the school its identity through his role as director and by outlining its overall research strategy. *Dialectic of Enlightenment* ([1944] 1972), which he wrote with Adorno, became the pivotal work of the Frankfurt school with its attack on the

culture industry and the instrumentalism prevalent in the administered world of capitalism and fascism. Horkheimer also highlighted the school's identity in his role as editor for works on anti-Semitism. However, he ultimately rejected his radical adherence to both Marxism and communism because of the tyranny that had occurred under Stalinism. He moved even further away from the radicalism of the school by supporting the Vietnam War and criticizing the student uprisings of the late 1960s.

Fromm is a relatively neglected and controversial figure in the history of the Frankfurt school but still an important one given his emphasis on psychoanalysis and his attempts to link the ideas of Sigmund Freud and Marx. A close friend of Horkheimer's, he was appointed to the institute in 1930 as director of its social psychology section and was tasked to do an empirical social-psychological study of the characteristics and attitudes of the German working class. This project involved distributing a questionnaire to over 3,000 workers, with 1,100 responding, and it was followed up with in-depth interviews. From the survey, Fromm discerned character types of people's personality ranging from authoritarian at one extreme to ambivalent in the middle and to radical revolutionary at the other extreme. He discovered that the German working class was more prone to the authoritarian end of the scale and hence susceptible to fascism, a finding that went against the assumptions of both the Communist Party and the Social Democratic Party. However, the institute decided not to publish Fromm's findings, perhaps, as Marcuse pointed out, because they could be seen as supporting the idea that the workers in Germany had always been fascist anyway. On a more positive note, however, the methodology of the study was utilized by Adorno, despite his hostility toward Fromm, and his associates in the school, for the character type portrayed in the highly influential and massive work *The Authoritarian Personality* (1950). Fromm did publish a major article in the *Journal for Social Research*, "The Method and Function of Social Psychology," that impressed Horkheimer and influenced the school to engage with Freudian analysis and its relation to Marxism. He was also a leading researcher in the institute's work on *Authority and the Family* (1936). However, it was his ultimate rejection of Freud's theory of the instincts in 1938 that led to a split with Horkheimer, Adorno, and Marcuse and was the main cause of his departure from the school in 1939. Nevertheless, his contribution to the

psychoanalytic side of the school's work, linked to his humanistic interpretation of Marx, remains influential.

Walter Benjamin's contribution to the identity of the school, like Fromm's, is shrouded in controversy, as he had long-running disputes with other members, most notably Adorno. His primary contribution came in his sociocultural critique of the arts, broadly conceived, as exemplified in his essay "The Work of Art in the Age of Mechanical Reproduction." There he argued that aura gives the uniqueness and originality to a work of art and so cannot be preserved when the artwork is reproduced. Thereafter, Benjamin's concept of aura became increasingly important in the institute's analysis of culture. Similarly, his analysis of the crowd in mass society from "Certain Motifs in Baudelaire" shaped the institute's work.

In the wake of Benjamin's tragic death while fleeing the Nazis in 1940, his frequent critics Adorno and Horkheimer promoted his work and ensured his lasting legacy, which continues to the present. In fact, an initial mimeographed memorial volume included works by Benjamin, Horkheimer, and Adorno. When the institute returned to Frankfurt, Benjamin's and Adorno's friend Gershom Scholem helped ensure the publication and dissemination of Benjamin's works.

Along with Horkheimer, Adorno is seen as one of the pivotal figures of the Frankfurt school. He joined the institute in 1938 and as we have seen above was coauthor with Horkheimer of *Dialectic of Enlightenment*, a key text of the school and was involved in the projects on authoritarianism. What Adorno also brought to the school was a body of work that very much defined what critical theory was about in relation to philosophy, music, and aesthetics right up until his death. His pivotal works were *Minima Moralia* (1951), *Negative Dialectics* (1966), and the posthumously published *Aesthetic Theory* (1970). *Minima* encapsulated a key aspect of the school's emphasis on human alienation, not simply in relation to production, but in every aspect of human existence in an increasingly administered world. *Negative Dialectics* referred to a process of reflexive questioning that undermines identity theorizing through nonidentity theorizing. Whereas identity theorizing attempts to subordinate particularity under universal concepts, nonidentity theorizing exposes the divergence between these

moments and thus their multiple potentials in a dynamic social world. *Aesthetic Theory* is now seen as a culmination of Adorno's understanding of art in its many forms and his hope for redemption through it. Some, however, view this phase of Adorno's work as a retreat into aesthetics from the fervor and turmoil of the student protests of the 1960s, denting not only his own reputation, but that of the school itself.

It then fell to Marcuse to restore and preserve a more positive impression of the school. Marcuse joined the institute in 1932 to finish his Habilitation, or second dissertation, on *Hegel's Ontology and the Foundation of a Theory of Historicity*. He published a number of articles in the *Journal for Social Research* between 1934 and 1938, covering issues such as the critique of liberalism and the totalitarian state, the development of the notion of essence, philosophical and cultural theory, and an examination of hedonism. Unlike Adorno and Horkheimer, he remained in the United States when they and the institute returned to Germany, but he was still seen as a major figure in the Frankfurt school right up until his death in 1979. One of his key contributions that captures the radicalism of the 1960s was his *One-Dimensional Man* (1964), which exposed how the postwar boom had integrated workers into the capitalist system and nullified their opposition to it through relative affluence and the ability to buy an endless procession of consumer goods. Marcuse instead looked to the student movement and the dispossessed as new agents for bringing about a new society free from domination and oppression.

Habermas is seen as being part of the school because he studied with Adorno and Horkheimer and took over the latter's chair. He is also seen as being pivotal in developing the critical theory tradition, particularly with his theory of communicative action. This arose out of his interest in reason and rationality, discourse ethics, and deliberative democracy. As his work has progressed, he has developed his thought across a wide-ranging number of areas from religion to issues in European politics. Whether in the present time he can still be seen as the bearer of the ethos of the Frankfurt school is open to debate, but his historic place in its history cannot be denied. Similarly, the institute, now under the directorship of Honneth, still engages in a critical theory approach but is generally not seen as a continuation of the Frankfurt school. Rather, it serves to preserve one of the school's

main tenets: the use of the interdisciplinary method to critique existing society. In that sense, and with the continued relevance of the pathbreaking work of its main theorists, the school's spirit lives on.

Freedom of Expression

Freedom of Expression

Freedom of expression is widely regarded as a basic human right. It has found legal expression in various written national, state, and provincial constitutions as well as in international human rights conventions. It was defended by John Milton in the seventeenth century and was constitutionalized as freedom of speech by the United States in 1791.

Despite its near universal acceptance as a basic human right, debates over its justification, scope, and weight abound. With respect to its justification, some regard it as an integral component of democratic governance and hence as justified to the extent democratic governance is justified. Others, most famously John Stuart Mill in *On Liberty* ([1859] 1956), give various consequentialist justifications: freedom of expression promotes the search for truth and thus social betterment, freedom of expression furthers autonomous thought and conduct, and suppression of freedom of expression is generally a sign of improper governmental purposes. Others give a deontological justification for freedom of expression as an inherent right, even if its use causes problems. Still others combine ontology with utility in arguing that government does not show proper respect for its citizens if it presumes they will be persuaded to act improperly merely because they hear certain messages.

Each of these justifications for freedom of expression is subject to criticism. Freedom of expression is believed to be a moral and international legal right even in regimes that are not democratic. Moreover, the scope of the

expression relevant to democratic decision making is indeterminate, potentially as narrow as speech specifically assessing candidates and programs or as broad as speech expressing any idea that might conceivably be politically relevant.

With respect to expressive freedom's contribution to the search for truth, there is no single truth but only various truths of varying degrees of importance and certainty, some of which will be disclosed by expressive freedom and others of which will be distorted or suppressed by it. Moreover, in specific domains in which ascertaining the truth is of paramount importance—for example, legal trials, scientific research—expression is highly regulated by rules of evidence, peer review, and the like.

With respect to promotion of autonomy, although expressive freedom does contribute to autonomy in one sense, it may also impede it through misleading people, inciting violence, disclosing confidential information, and in all sorts of other ways. Moreover, autonomy is promoted (and impeded) by all sorts of regulations that have nothing to do with expression so that with respect to promoting autonomy, there is nothing distinctive about expressive freedom.

Although suppression of expression may be an indication that government is acting improperly, there are many reasons for suppression, including the damage done by hate speech, that are also regarded as quite proper reasons for government to act upon in regulating behavior. And the deontological justification applies only to suppressions of expression on the ground that the expression's audience might act improperly, whereas most governmental reasons for suppression are not of this type. Moreover, even this justification seems too strong, as it would preclude government from forbidding solicitations of crime and publishing of information useful in committing them, such as how to build bombs, hack into computers, or get away with murder.

Laws considered possibly violative of the right of freedom of expression can be divided into those that penalize expressions because of the messages they convey—content-based laws—and those that incidentally affect expression but that are not aimed at messages. (A third category would be

acts of expression by the government itself, or governmental subsidies and encouragements of some messages not accompanied by suppression of opposing messages.) Message regulations can be in turn divided. For some message regulations, the government fears the audience will be persuaded to act improperly and desires to prohibit not only the audience's acts, but also the messages that potentially persuade. Examples are advocacy or solicitations of crime, publication of information useful for criminals, and speech that provokes but does not advocate crime. For other message regulations, the government fears a harm that will occur either upon mere receipt of the message or upon audience acts in response that cannot be controlled or penalized. Examples are laws protecting secrets, confidential communications, privacy, reputation, freedom from deception, freedom from threats, intellectual property, freedom from offense and emotional distress, and the morale of governmental workers.

Laws that incidentally affect expression include not merely laws regulating the time, place, and manner of expression—such as those against yelling fire in a crowded theater—but in reality all laws. For all laws affect, directly or indirectly, what gets said, by whom, to whom, and with what effect.

Beyond state actions affecting freedom of expression, the general social climate of tolerance or intolerance can have similar, or as Mill (1859) argues regarding public opinion, even stronger effects. The global controversy in recent decades over “political correctness and incorrectness,” all across the ideological spectrum, stems in large part from objections by those who feel that their freedom of expression is being unfairly denied, discouraged, or punished (Cummings 2001).

Finally, although one sometimes sees a distinction drawn between speech and symbolic speech, in reality all speech is symbolic. And no matter what symbols are employed—marks, sounds, pictures, dramatization, music, and so on—what is important is whether the government—and/or public opinion as shaped by government—is regulating the message or is instead regulating the medium for reasons that are not message-related.

Freire, Paulo

Freire, Paulo

Freire, Paulo

Paulo Freire Reglus Neves (1921–97) has achieved iconic status among educators and a whole range of cultural workers. Born in Recife (Pernambuco, N-E Brazil), Freire dedicated the best part of his life to combating social injustices. He suffered imprisonment and exile for his efforts in planning what was perceived as being a subversive approach to literacy in Brazil in the early 1960s. He moved briefly to Bolivia and then to Chile, where he was engaged in an educational program connected with the agrarian reform, and later to the United States, where his *Pedagogy of the Oppressed* ([1970a] 1993) was published in English translation. He eventually went to Geneva, where he worked for the World Council of Churches. He was frequently called upon by revolutionary governments, such as those in Guinea-Bissau and Nicaragua, to assist them in developing and evaluating educational projects. He also used his sixteen-year exile to work with different groups in Europe. Following his return to Brazil, he engaged in municipal educational administration in São Paulo. Many of his works were translated into English and other languages.

Freire's celebrated *Pedagogy of the Oppressed* is considered exemplary in its reflections on the various contexts with which he was engaged. In this work, Freire provides rich theoretical formulations and insights from a variety of sources. His work emphasizes the political nature of education: education is politics. For Freire, education cannot be neutral; it can either domesticate or liberate. A liberating education enables learners to engage in a dialectical and empowering relationship with knowledge and society.

A top-down prescriptive process of teacher-student transmission constitutes a domesticating, banking education. Freire advocates an interactive, authentically dialogical approach to knowledge. Although not on an equal footing, teacher and learner learn from each other as they dialectically co-investigate the object of knowledge. The concept involved is praxis, which is central to Freire's educational philosophy. Learners and educators obtain critical distance from the world they know in order to perceive it in a critical light. The community is researched beforehand by a team of educators and project participants through informal meetings with community members and close observation of their speech patterns, ensuring knowledge of the community members' concerns. The insights derived from this research are codified into learning materials to enable learners from the same community to collectively unveil the underlying contradictions of their society.

Freire emphasizes the pedagogy of the question. Knowledge is problematized in a problem-posing rather than a problem-solving approach. Knowledge is, therefore, not something possessed by educators that they transfer to the learner but is explored collectively, culminating in dynamic, created knowledge. The approach is directive, actually codirective, since learning is conceived of as a political act involving both the discovery and the creation of knowledge by students and teachers working together. This partnership must not degenerate into either teacher authoritarianism or student anarchy. The teacher's knowledge and pedagogical expertise should win the students' respect and provide an inspirational platform for their exploration. Only through dialogue does the group learn collectively to unveil personal and societal contradictions. Adult educators are to show tact when promoting dialogical relations. They often alternate dialogue with instruction; people exposed for years to banking education do not engage in dialogue easily. The starting point is the learner's existential reality, which becomes the starting point, not the be-all and end-all of the learning process, lest the quest for authentic knowledge lapse into populism. Educators must have enough humility to relearn, through their dialogic interactions with the learners, what they think they already know.

Freire conceived of the educators and learners as "integral human beings" (Darder 2002, 94) in an educational process based on love and thus

humanizing the relationship between teacher and taught (teacher-student and student-teacher, in Freire's terms). This education process also drives the educator forward in teaching and working for the dismantling of dehumanizing societal structures of all kinds. The entire pedagogical process practiced and articulated by Freire is based on his trust in human beings' ability to create "a world in which it will be easier to love" (Freire [1970a] 1993, 40; see Allman 1998, 9). His concept of love has strong Christian overtones as well as revolutionary ones.

Freire's robust, international influence has extended to such diverse areas as the philosophy and sociology of education, theology, anthropology, communications, theater studies, and health studies. He has influenced teachers, social workers, and social-movement activists such as those working in the Movement of Landless Peasants in Brazil.

French Enlightenment

The Enlightenment was a broad, diffuse movement of reform that swept across the Western world in the eighteenth century. Although it was very much an international phenomenon, it varied in tone and emphasis in different national contexts. In France, the Enlightenment encompassed a somewhat broader range of opinions than in most countries, a breadth that made it particularly diverse and fractious. It was led by a small band of (mostly) Paris-based writers such as Charles-Louis Montesquieu, Francois-Marie Arouet Voltaire, Denis Diderot, Jean-Jacques Rousseau, Jean d'Alembert, the Comte de Buffon, Claude Adrien Helvétius, the Baron d'Holbach, Étienne Bonnot de Condillac, and the Marquis de Condorcet, known collectively as the *philosophes*, a French word that means both a philosopher in the narrow sense and a thinker or intellectual more broadly. Most of the leading proponents of the Enlightenment in France were philosophes in the latter sense. Beneath this high Enlightenment of intellectuals was a broad spectrum of literate individuals who both were affected by Enlightenment ideas and influenced its character, including many people who met regularly, shared knowledge, and debated ideas in an informal public sphere of salons, coffeehouses, and lodges across France, particularly in the second half of the eighteenth century. Some of those who belonged to the so-called low Enlightenment popularized the ideas of the philosophes for an even wider audience and engaged in lively polemics in the Grub Street world of hack writers and disreputable publishers. All were united by a common faith in science and reason as the best means gradually

to improve the condition of humanity and promote progress, although there were sharp disagreements among them over specific questions such as the nature and existence of God and the ideal form of government by which to advance the cause of popular enlightenment.

Around the middle of the eighteenth century, an influential group of writers in France formed themselves into a loose society of men of letters with broadly shared values, tastes, and beliefs. It was not until then that the philosophes in France actually started to think of themselves as an informal party—the party of humanity—devoted to the promotion of enlightenment and progress. From about this time, they came to regard themselves as the self-appointed leaders of an unofficial opposition to the religious, political, and philosophical establishment in ancien régime France with a mission to legislate for the rest of the nation in matters of philosophy and taste. Their preferred habitat was the salon, the most prominent of which in Paris after 1750 was that of the atheist Baron d’Holbach (1723–89), whose biweekly dinners at his large home in the center of the city earned him the title of maître d’Hotel de la Philosophie. The salon of Mademoiselle de Lespinasse (1732–76)—the muse of the *Encyclopédie*—was also popular with leading philosophes, regularly attracting luminaries such as d’Alembert, Chastellux, Marmontel, Turgot, Morellet, Saint-Lambert, La Harpe, Suard, abbé Arnaud, Malesherbes, Diderot, Grimm, Condillac, Duclos, Raynal, Damilaville, and Bernardin de Saint-Pierre. This salon served as a kind of unofficial headquarters of the French Enlightenment, whereas d’Holbach’s salon in the rue Royale tended to be popular with the more radical philosophes.

The supporters of the Enlightenment in France were committed to the emancipatory project of liberating the mind and power of human beings from what they saw as the fetters of prejudice, intolerance, and tradition so that the individual would be capable of free and independent action. Negatively, this required tearing down the many obstacles to a clear and accurate perception of reality, such as superstition and dogma. The greatest of these obstacles, they thought, was the church, the Enlightenment’s principal target in France. While the Pope himself had little more direct influence in France than he did in many Protestant countries, the eighteenth-century Catholic Church in France continued to enjoy much of

the power and many of the privileges that it had traditionally held: the Crown was still officially based on a divine right theory of monarchy; the church continued to collect tithes and enjoyed special exemption from taxes, despite its enormous wealth; it exercised responsibility for much civil policy (in education, for example); and the eighteenth-century French state enforced, in a very sporadic and inconsistent manner, outward religious conformity through an imperfect regime of censorship, the regulation of public worship, and criminal prosecution. This forced conformity was particularly the case after the assassination attempt on Louis XV in 1757, which fueled the establishment's growing fear and intolerance of radical ideas. A law was then passed in France sanctioning the death penalty for writers and publishers convicted of attacking religion or the state, although it was seldom enforced. In 1759, the *Encyclopédie* was officially suppressed, and the Pope placed it on the Index of Forbidden Books. Prominent philosophes such as Voltaire (1694–1778) and Diderot (1713–84) had been incarcerated for their irreverent opinions, and Helvétius (1715–71) and La Mettrie (1709–51) narrowly escaped the same fate by fleeing into exile, as did the abbé Raynal (1713–96). As a result of this continuing ecclesiastical wealth, power, and persecution, the Enlightenment in France had a markedly anticlerical cast not typically found among the *Aufklärer* in Germany or their kindred spirits in Britain or the United States.

Virtually all of the philosophes were strongly averse to religious dogmatism and clerical authority, and most vigorously criticized established religious institutions and beliefs in favor of a minimalistic and universal natural religion. Voltaire fought against religious persecution in France in *causes célèbres* such as those of Jean Calas (1698–1762) and Jean-François de la Barre (1745–66), who were convicted on trumped up charges, tortured, and executed primarily for being Protestants in a Catholic country. This persecution enraged Voltaire, who campaigned to “écrasez l’infâme” (to crush the infamous thing—the established church).

Although the philosophes have commonly been portrayed as atheists, most were actually deists who believed in the existence of a necessary, eternal, supreme, and intelligent being that was no matter of faith, but of reason, as Voltaire explained it. While there were certainly atheists among the philosophes, most notably La Mettrie, d’Holbach, Helvétius, and

(eventually) Diderot, the vast majority affirmed a belief in a remote deity that did not intervene directly in human affairs. Most believed that the universe was governed by natural laws established by God, and many attacked atheism as both untrue and morally dangerous. Hence Voltaire's declaration, "If God did not exist, it would be necessary to invent him."

The scientific method of Francis Bacon (1561–1626) and Isaac Newton (1642–1727) was taken by the Enlightenment's proponents in eighteenth-century France as the model for the systematic and reliable acquisition of knowledge, in contrast to the obscurity of traditional metaphysics and orthodox religious beliefs, which science had disproved or displaced in the eyes of many. Faith in natural science as the best means for improving human well-being was very widespread, if not universal, during the eighteenth-century Enlightenment. Most of the philosophes believed that universal reason ought to replace arbitrary and irrational beliefs, and those aspects of moral, social, and political life that had previously been accepted unquestioningly should be subject to chronic revision and scrutiny in light of their practical usefulness and new information made available through scientific investigation and discovery. Science, reason, and liberty alone can cure men and make them happier, according to the Baron d'Holbach. Traditional beliefs and prejudices that failed to meet this critical standard ought to be discarded without sentimentality. In the words of Diderot, writing in the *Encyclopédie*, "Everything must be examined, everything must be investigated, without hesitation or exception."

The *Encyclopédie* that Diderot coedited with the French mathematician Jean d'Alembert (1717–83) embodied this outlook perhaps better than any other work of the age and was intended to be a *machine de guerre* of the Enlightenment. It was a hugely ambitious compendium of knowledge published between 1751 and 1772, comprising twenty-eight large volumes, with 71,818 articles and 3,129 illustrations, including contributions by most of the leading philosophes of the day such as Voltaire, Rousseau, Montesquieu (1689–1755), Turgot (1727–81), and d'Holbach. This controversial and influential project was deliberately subversive of many traditional religious and political beliefs, which eventually led its official suppression in France.

Almost all of the philosophes were empiricists, believing that the human mind is a blank slate that acquires knowledge by means of sensory impressions. This view went against the orthodox Christian belief in innate ideas (of God, for example) and original sin, which was still a key article of Christian faith in eighteenth-century France. Enlightenment epistemology was therefore strongly at odds with traditional Catholic teaching about human nature.

On the nature and power of reason the differences between the mainstream Enlightenment view and that of the church was less stark, even if many theologians and clerics thought otherwise. It was commonly thought, particularly by critics of the Enlightenment, that the philosophes had a naïve faith in the power of human reason to guide human affairs. It is undoubtedly true that they valued reason highly. For example, in his *Preliminary Discourse to the Encyclopedia of Diderot*, published in 1751 (1963), d'Alembert outlines a naturalistic and secular method for organizing the vast amount of knowledge that the *Encyclopédie* had assembled, which he divided into three broad categories: history, philosophy, and fine arts, corresponding to the faculties of memory, reason, and imagination in the human mind. He gave pride of place to reason, since it is “in conformity with the natural progress of the operations of the mind.” Although d'Alembert concedes that, once imagination has made its first steps, it moves much faster than reason, which frequently exhausts itself in fruitless investigations. He depicts reason as the glory of the human mind and describes philosophy as the dominant taste of our century. The *Preliminary Discourse* also pays lavish tribute to important innovators such as René Descartes (1596–1650), Newton, Bacon, and John Locke (1632–1704) in the progressive search for a new methodology for acquiring knowledge that he hopes will give mankind the power to independently shape and direct its own destiny.

However, the Catholic Church was far from repudiating reason as such. Instead, it typically defined reason in a way that was consistent with the Christian beliefs that the philosophes rejected. Also, most philosophes had a keen appreciation of the power of the passions and many, such as Diderot, welcomed the liberation of our passionate natures from the constraints imposed on them by orthodox Christian doctrines that traditionally pitted

the sins of the flesh against the purity of the spirit. In other words, the debate between the proponents of the Enlightenment in France and the church tended to be more about the nature of reason and less about whether reason was a good or bad thing per se.

An intense interest in secular history was common among the philosophes, for a variety of reasons. Some wished to provide an alternative account of the past to rival that of the Biblical account and standard church-sanctioned histories, stressing the latter's distortions of the truth, wicked consequences, or irrelevance, as they saw it. For example, Voltaire wrote popular histories such as *Siècle de Louis XIV (The Age of Louis, 1751)* in which the church plays either a villainous or at best, marginal role in human affairs. His *Encyclopédie* article "Histoire" calls for precision, accuracy, and breadth in the study of history and criticizes the traditional historical focus on kings, wars, and religion. In one of the most widely read works of the French Enlightenment, the epic, massive thirty-six-volume *Histoire naturelle* (1749–88), the Comte de Buffon (1707–88) provided a naturalistic history of the world that all but ignores the Bible. This work led the Faculty of Theology at the Sorbonne to condemn the work, which its author retracted (although he carried on writing his magnum opus regardless).

Although the philosophes have often been mocked for what many see as their naïve optimism, this criticism is based on a misconception of the mainstream Enlightenment view of progress in eighteenth-century France. The Marquis de Condorcet's (1743–94) *Esquisse d'un tableau historique des progrès de l'esprit humain (Sketch for a Historical Picture of the Progress of the Human Mind, 1795)*, written just before he died in prison awaiting execution, probably comes the closest to this stereotypical view of the Enlightenment. It will vary in speed, he conceded, but progress "will never be reversed as long as the earth occupies its present place in the system of the universe." However, this work is highly unrepresentative of the philosophes, who tended to be much more skeptical about progress than Condorcet. Voltaire, who was in many ways the quintessential figure of the French Enlightenment, parodied naïve optimism in his mordant tragic-comedy *Candide* (1759), and he wrote to Diderot, "Our age is still quite barbaric." All of the philosophes agreed that progress is at least possible; most thought that it was probable; virtually no one (apart from Condorcet)

believed that it was inevitable. They had a keen appreciation of the many obstacles that stood on the path to progress, above all the church, although few seriously doubted that progress had been made and that the general trajectory of historical development was likely to continue gradually to improve.

One reason for this general—if very cautious and heavily qualified—optimism was the philosophes' rejection of the Christian belief in original sin in favor of a belief in natural human goodness. Not only did most affirm that human beings are untainted by an indelible corruption but given the empiricism of the French Enlightenment, they saw human nature as malleable and therefore, potentially infinitely improvable or perfectible.

There was little consensus among the Enlightenment's proponents in France on the best political means for attaining the common ends they shared. Their views on the best way to promote human well-being covered a broad spectrum, ranging from enlightened despotism to moderate constitutional government and popular democracy, although there were very few who advocated the latter. Voltaire and d'Alembert spoke for many in defending enlightened absolutism as the most effective way to elevate the masses and promote human progress. Voltaire was often contemptuous of *la canaille* (the rabble), as he often called them, believing that progress would stand little chance if left to their whims and preferences. Better to entrust power to enlightened, improving monarchs such as Frederick II of Prussia (1712–86). The democrat Rousseau (1712–78), a bitter rival and critic of Voltaire, disagreed sharply with him on this point, putting his faith in the simple virtue of ordinary people in his book *Du contrat social* (*The Social Contract*, 1762), which was unpopular with most of his fellow philosophes, few of whom were much perturbed when it was banned in Paris and Geneva and placed on the Vatican's Index of Forbidden Books for its subversive defense of the sovereignty of the general will. However, it was both widely read and enormously influential among the later generation of radicals who dominated politics during the French Revolution. For example, Maximilien Robespierre (1758–94) was inspired by Rousseau's case for republicanism and popular sovereignty, a form of which he sought to impose on France (with disastrous results) despite Rousseau's clear assertion in *The Social Contract* that it only applied to small city-states. The only place that the

Genevan thought his political principles had some chance of working in modern Europe was on the island of Corsica, a claim that Robespierre either overlooked or chose to disregard.

Condorcet, who was one of the only philosophes to live until the French Revolution, took a position that was much closer to that of the mainstream Enlightenment when he became a supporter of the moderate Girondist faction of revolutionaries in the Convention. He was arrested by the Jacobins and imprisoned, where he died in 1794. It is doubtful that many of the philosophes would have gone even as far as Condorcet had they lived long enough to see the Revolution, although we will never know. Even Rousseau, who inspired the Jacobins, claimed to have a great aversion to revolutions.

The Enlightenment was tainted by the violent excesses of the French Revolution, which many counterrevolutionary writers such as Joseph de Maistre (1753–1821) and Augustin Barruel (1741–1820) attacked for causing the breakdown of the social and political order that led to the events of the 1790s in France. Barruel's best-selling and enormously influential book *Memoirs Illustrating the History of Jacobinism* (original title *Mémoires pour servir à l'Histoire du Jacobinisme*), which was published in 1797, blamed the Revolution on a conspiracy of philosophes and on German (mostly Bavarian) Illuminati who deliberately plotted to overthrow the ancien régime. The values and consequences of the French Enlightenment have never ceased since to provoke vigorous debate and controversy, with admirers and detractors on all points of the ideological compass, who continue to argue over its legacy.

French Political Thought

Many French political thinkers, from François-Marie Arouet Voltaire to Michel Foucault, have had a profound effect on intellectual life and political events in much of the world. Their ideas, however, were shaped in part by the French cultural environment in which they were developed, and their most profound influence has been felt in France. Accordingly, French political thought is defined here as the contributions of philosophers, essayists, and political figures to the debate and conflicts that have shaped French society. The account of French political thought given here is centered on events and circumstances that have altered the course of French history or that are deemed to portend further transformations of French society. These include, first and foremost, the French Revolution of 1789 and its aftermath, the establishment of the Third Republic in the last quarter of the nineteenth century, the traumatic defeat of 1940, the Vichy regime (1940–44) followed by the Liberation of 1944–47, the colonial wars in Indochina and Algeria in the 1950s, the events of May 1968, European unification, and in more recent times, globalization—French public opinion and the French intellectual elites have reacted to globalization with a degree of pessimism and distrust that is arguably unique in the Western world.

The Long Shadow of the French Revolution

The French Revolution, which began in July 1789, marked the culmination of the intellectual ferment of the preceding three or four decades known as

the Enlightenment. But the political upheavals of the 1790s also brought about divergent interpretations of these ideas. These antagonistic doctrines continue to resonate in French political debates to this day.

The *encyclopédistes*, which is to say the authors of the various entries in the famous encyclopedia edited by the philosopher Denis Diderot and Jean d’Alembert, represented the main current of the French Enlightenment. They advocated using reason—the power of human understanding unsullied by religious dogmas—to make sense of natural phenomena and social situations; they viewed it as the only road to truth. They also proclaimed the existence of inviolable natural rights held in common by all men. Whether the generic term *hommes* (men) was really meant to include women, as it is still common usage in the French language or whether, in fact, it implicitly meant males only, was a contested subject; the Marquis de Condorcet and the early feminist Olympe de Gouges contended that women should be granted all the rights of citizenship, but they stood mostly alone on that point.

While the major figures of the French Enlightenment wished for social and political reforms, they were more confident in the power wisdom of enlightened despots such Frederick II of Prussia, whom Voltaire visited, than in the capacity of democracies to implement them. However, as a result of the American Revolution, in the years immediately preceding 1789, a number of younger writers and liberal aristocrats, such as the Marquis de Lafayette, Condorcet, the Abbé Sieyès, began to advocate an end to absolutism. Their hopes were fulfilled with the adoption of the *Declaration of the Rights of Man and the Citizen* (in August 1789) that then became the preamble of the Constitution of 1791.

The Declaration embodied distinctly liberal principles, rooted in natural law theory, such as protection against arbitrary arrest, and guarantees for the freedom of religion, freedom of expression, as well as the recognition that property rights are inviolable and sacred, suggesting that its drafters were familiar with the ideas of John Locke. But to interpret the Constitution of 1791, it is necessary to revisit the writings of the Baron de Montesquieu.

Montesquieu’s somewhat disjointed political theory (contained in his famous *The Spirit of Laws*) resists simplification, but the need to check

power with power stands out as one of its dominant themes. In a narrow sense, this principle led to constitutional rules that create separate domains for the executive, legislative, and judicial branches of government. Even before the French Constitution of 1791, the American Founding Fathers, who professed admiration for Montesquieu, had entrenched the separation of powers into their 1781 constitution. Since then, that principle has been adopted in varying degrees by all liberal democracies. In a broader sense, Montesquieu defended the ideal of a pluralistic civil society in which there exist many sources of countervailing social, cultural, and political power capable of keeping the central government in check. This vision has inspired many French political thinkers from Alexis de Tocqueville to the early twentieth-century philosopher Emile Chartier Alain, as well as by socialists such as Pierre-Joseph Proudhon and contemporary ecologists. Significant as this tradition is within French political thought, it never became the prevalent one. This lack is perhaps one of the clearest differences between French political thought and Anglo-American political thought; the latter has always been more favorably disposed toward decentralization and pluralism.

The classical liberal principles, albeit mixed with values inherited from neo-Roman republicanism, such as a belief in the rule of law, that guided the early stages of the Revolution were soon to be challenged by a radically different interpretation of republicanism, political rights, and the role of the state. That alternative vision found its expression in the speeches of the revolutionary leaders Maximilien Robespierre and Louis Antoine de Saint-Just and the actions of their followers. Notwithstanding original touches added by these leaders—most notably the idea that a republic could be established in a large nation and not just in a city-state like Rousseau's Geneva—their doctrines were largely derivative. They looked for inspiration in Rousseau's works, which is not to say that they were entirely true to the spirit of their master's vision.

Rousseau's political theory was developed in reaction to the French Enlightenment. It can be described as a two-step process. First, in his two discourses, Rousseau attacked the Enlightenment faith in reason, science, and progress, including what we would today call economic growth that French political economists known as the Physiocrats (to whom we owe the

phrase *laissez-faire*) sought to promote by encouraging the removal of trade barriers. Then follows a second step that was the subject of his celebrated *Of the Social Contract* (1762): by renouncing all their previous rights and forming a new political community on the ruins of the existing order, the citizens of an ideal state would collectively exercise political sovereignty. Their authentic desire to achieve the common good would constitute the general will. Laws that give expression to the general will are legitimate and must be obeyed by all. Statesmen in this ideal state must exercise great care to prevent the formation of what today we would call special interest groups, for the sum total of these narrow interests cannot be regarded as the indivisible general will of a virtuous sovereign people.

Robespierre and his allies, many of whom belonged to the Club des Jacobins, hence the name that is still attached to them, were convinced that they represented the general will of the French nation. This legitimized their short Reign of Terror (1792–94), a term that they themselves used to describe the repressive methods they deployed against all those who in their eyes failed to live up to the standards of virtuous citizenship. The *Terreur* ended with the fall of Robespierre in 1794, but the Jacobin spirit of 1793 lived on. In the late nineteenth century and throughout the twentieth century, Jacobinism was recast in a more reformist and democratic mold. Its central tenets are (a) a centralizing perspective that places great stress on the role of the state in guiding the nation in many areas of public life, from education to economic development; (b) a distrust of organized interests, especially business lobbies, but also of religious ones—neo-Jacobins tend to interpret the separation of church and state as meaning that the state must promote not only religious neutrality but the absence of religious referents (e.g., the word God) in public discourse and political institutions (this is known as the doctrine of *laïcité*, a term that is untranslatable in English); and (c) a preference for the term *equality* in the motto of the French Republic “Liberty, Equality, Fraternity.” In modern France, left-of-center neo-Jacobins (e.g., the dominant current within the French Socialist Party) and right-of-center neo-Jacobins (e.g., the Gaullists, who claim to follow in the political footsteps of General Charles de Gaulle, the first president of the French Fifth Republic, established in 1958) continue to hold these ideas. For example, Rousseau’s condemnation of luxury and commercial mores has given way to an acceptance of economic growth but continues to be

expressed in the form of distrust for market economics that cuts across ideological differences on other issues.

The revolutionary era went through more episodes before Napoleon Bonaparte declared himself Emperor in 1804, but for our purpose here they are not as significant, except to note that they occurred in a climate of political uncertainty that was in part caused by rather disastrous constitutional designs, at least one of which bear the marks of Seyès's preference for complex systems of representation that showed some theoretical merits but proved to be unworkable. (The French tendency to approach constitutional design as an abstract project informed by reason alone has been denounced by a long line of critics in the Anglo-American world, from Edmund Burke to F. A. Hayek.) What matters here is that the Revolution as a whole, but especially the two watersheds of 1789 and 1793, gave rise to three ideological families—a term meant to convey that each one of them includes many tendencies.

Revolutionary Utopianism

Revolutionary utopianism did not disappear from the French political scene with the demise of the Jacobins, nor did it remain synonymous with a radical interpretation of Rousseau's political theory. It evolved toward socialism. At first, French socialists such as Auguste Blanqui advanced their own revolutionary doctrines, but toward the end of the nineteenth century, many of them veered toward Marx's historical materialism and aimed for the dictatorship of the proletariat. After the Russian Revolution of 1917, that current found its home in the French Communist Party, which played a crucial role throughout much of the twentieth century. But other currents continued to challenge the communists and the legacy of at least some of them still lives on.

Proudhon promoted the idea of a peaceful transition to a society organized around workers-managed cooperatives federated into larger units all the way up to national democratic institutions that would deal with questions that could not possibly be handled at a local level. Proudhonism never developed into a powerful political movement, but since 1968 there has been a renewal of interest in self-management and the notion of a solidary

economy that would be neither capitalist nor centrally planned. Besides Proudhon, humanistic socialism's other great apostle was Jean Jaurès who pleaded for a reconciliation of the social classes through the design of appropriate institutions.

A far more violent tendency is associated with Georges Sorel who in his *Reflections on Violence* (1908) advocated constant agitation and an anarchistic conception of the aims of the workers' struggle. Sorel's influence on the French trade unions movement was rather short lived and in fact was more a legitimization of a brief episode of violent protest in the history of that movement than its cause. But his mystique of violence led a few socialist leaders in the direction of fascism during the 1930s, and some went on to support the Vichy regime after 1940. Today's antiglobalization anarchistic groups also evoke Sorel's ideas.

The French Communist Party emerged from World War II with an immense prestige because of its active participation in the French Resistance. It was briefly included in a provisional government (1944–47) that preceded the creation of the Fourth Republic but never regained power after that time. However, its influence and consequently, that of orthodox Marxism on the French cultural scene from 1945 to 1968 cannot be underestimated. Marxism made deep inroads in the disciplines of history (e.g., Georges Lefebvre, Albert Soboul) and philosophy (e.g., Louis Althusser). But the iconic example of the left-wing intellectuals' fascination with Marxism was Jean-Paul Sartre. Although the philosophy of existentialism that Sartre developed in the 1930s and early 1940s was essentially individualistic and relativistic, after 1945 he articulated a synthesis of existentialism and historical materialism. The focal point of this synthesis became the *intellectuel engagé* who freely chooses to devote his or her life to the cause of the proletarian revolution. In his often inflammatory speeches and his controversial political alliances, notably with Stalinists in the French Communist Party, Sartre attempted to become the very model of this concept.

The student rebellion (and the accompanying general strike) in May 1968 bears witness to the survival of this revolutionary tradition (the symbolic meaning of the street barricades erected by the students, replicating the

imagery of the 1848 revolution, was not lost on anyone). But the meaning and effects of these events are complex. On the one hand, they briefly occasioned a burst of radical Marxism that attempted to bypass the French Communist Party on its extreme left. On the other hand, the underlying ideology of 1968 was individualistic and relativistic. It brought about the eventual downfall of orthodox Marxism in France and the rise of postmodernism, which is associated with philosophers such as Foucault, Jean-François Lyotard, Jacques Derrida, Gilles Deleuze, Julie Kristeva, among others. They insisted that besides the class struggle there are equally important arenas of conflict centered on gender inequality, multiculturalism, ecological sustainability, and so on. In brief, there is no totalizing perspective that explains everything. And Foucault popularized the idea that power is dispersed and that multiple forms of resistance to the prevailing dogmas can spontaneously emerge (e.g., among women, the gay community, ecologists, etc.). French feminists, building on Simone de Beauvoir's pioneering works in the postwar years, turned to psychoanalysis in their contributions to third wave feminism. All these departures spelled the end of the messianic vision of a socialist endpoint.

Reactionary Countercurrents

At the opposite end of the political spectrum, the excesses of the French Revolution gave rise to a reactionary conservative movement. Its early defenders were the philosophers Joseph de Maistre and Auguste de Bonald who were acerbic critics of Rousseau and argued the case for a theocratic monarchy, on the model of the pre-1789 ancien régime. The reactionary faction became more diversified toward the end of the nineteenth century, although monarchists influenced by the writer Charles Maurras survived well into the twentieth century.

For much of the period extending from the 1890s to the present, the cause of nationalism was reclaimed by the extreme right. Initially, nationalism had been a progressive cause espoused by revolutionaries such as Georges Danton and the armies of the First Republic who attempted to propagate the ideal of republican self-government by unsettling feudal regimes throughout Europe. Thus, nationalism was conceived as devotion to the cause of not only transforming the kingdom of France into a nation of free

and equal citizens but also leading all European principalities and monarchies onto the same path. (Paradoxically, this stratagem provoked the birth of an ethnically based nationalism in the still not unified German principalities in particular; read in this respect Johann Gottlieb Fichte's *Address to the German Nation* [1808]) However, the civic nationalism of Danton was recast into the defense of the identity of an ethno-cultural nation defined by language, history and even, more ominously, blood lineage. Democracy, in the shape of the intense party politics that plagued the Third Republic, was perceived by many advocates of this brand of nationalism as a source of pernicious divisions that weakened the nation. Two events served as catalysts for this transformation: the loss of Alsace and part of the province of Lorraine to the Germans in 1870 and the Dreyfus affair that became a focus point for a latent anti-Semitism if not in French culture in general, at least among reactionary Catholic circles. The talented and passionate writer Maurice Barrès became the voice of antidemocratic and overtly anti-Semitic nationalism, although toward the end of his life he stepped back from the anti-Semitism of his youth.

With the collapse of the Third Republic in 1940 and the rise to power of Marshall Pétain at the helm of the Vichy regime (after the name of the capital of the so-called nonoccupied zone over which Pétain ruled), many of these right-wing nationalists and monarchists saw an opportunity to rebuild France on the model of an agrarian Catholic nation. Collaboration with the occupying Nazi forces was not their main goal, and they ended up being pushed aside by more avowedly fascist and even more rabidly anti-Semitic ideologues, some of whom were former socialists, who did actively promote collaboration with the occupier (e.g., Pétain's premier, Pierre Laval). Tragically, some of the best writers and journalists of that generation (e.g., Louis Ferdinand Céline, Robert Brasillach) were among them.

The defeat of Nazi Germany and the modernization of France initiated by the Liberation government headed by de Gaulle (himself a rather conservative, albeit not antidemocratic, nationalist) dealt a serious blow to this ideological family. However, in recent years the perceived threats to the integrity of the French nation posed by the combined effects of the presence of a large numbers of Muslim immigrants (most of whom are French

citizens by law) and of economic globalization have revived this current. So far, however, and contrary to the pre-1940 era, it has been rejected by the intellectual and artistic communities, and most of the media, with the notable exception of the philosopher Alain de Benoist who defend the idea that civilizations are inherently unequal.

Liberalism and Its Republican Avatars

Sandwiched between the revolutionary left and the reactionary right, the liberal family has had a difficult existence throughout French modern history, even though it counts some of the most brilliant defenders of liberal principles and values. As a consequence of this uncomfortable position, some of its adherents have at times made opportunistic compromises with parties or ideologies on their right or their left that diluted the liberal identity.

Never in his writings but very often in his political career, Benjamin Constant is a prime example of this dilemma. He was an ardent republican, then he briefly supported Napoleon when the latter reluctantly promised in 1815 to put in place a parliamentary regime; finally, he served as a member of the lower chamber of parliament of the constitutional monarchy established after the fall of the Napoleonic regime. These political contortions should not hide the fact that he remained true to his belief in the value of the principles enounced in the 1789 Declaration and in the virtues of representative government, within a constitutional framework that set limits to the powers of each branches of government, and of the state as a whole. He was equally opposed to the Rousseauian conception of radical democracy (which he denounced as nostalgia for the ancient Greek democracies whose citizens enjoyed the collective freedom of belonging to self-governing cities but enjoyed no individual liberties) and to the authoritarian absolutism of the reactionary monarchists. The zenith of classical liberalism in France occurred between 1830 and 1870 when, with the exception of the authoritarian phase of Napoleon III's reign in the 1850s, the political scene matched their ideal of constitutional representative government and when, in particular, their libertarian views on economic freedom were taken seriously, albeit not always strictly applied. Their organ was the influential *Journal des économistes* in which

political economists such as Frédéric Bastiat and Gustave de Molinari defended strict laissez-faire, free trade, and limited government. And on the more strictly political side of things, Tocqueville brilliantly dissected the differences between radical egalitarianism in French democratic thought and the more re-trained conduct of politics in America. Self-proclaimed liberals never regained that degree of prestige and influence after the fall of the Second Empire whose second constitution, proclaimed in 1869, they had enthusiastically endorsed because it instituted a British-style constitutional parliamentary monarchy in which they formed the first government under Émile Ollivier. From then on the tenets of the liberal doctrine (freedom of expression, limited government, respect for private property, etc.) could only be defended under the umbrella of centrist or moderate republicanism. Some important neo-Kantian political philosophers, Charles Renouvier in particular, explicitly attempted to legitimize this reinvention of republicanism whereby Kantian ethics and respect for the rule of law came to replace Rousseauian radicalism and its revolutionary ethos. Most governments of the Third Republic (1870–1940) governed from the center, as they successfully mobilized support against, first, resurgent monarchists, and then in the 1930s, the up-and-coming fascists on their right, and on their left against a growing socialist and communist threat. But the republicanism creed also justified using the power of the state to protect citizens against perceived injustices and abuses of power at the hands of employers in ways that classical liberals could not endorse, but which they were powerless to resist. These centrist republicans were nudged toward the construction of a modest welfare state by the solidarists. Solidarism is a doctrine elaborated by various social theorists, including Émile Durkheim, who has often been called the founder of modern sociology, and the philosopher Alfred Fouillée; it insists that the more privileged members of society owe a debt of sorts to those who were not able to take full advantage of the opportunities that an industrial society has to offer. The political leader Léon Bourgeois built a reformist political platform on these ideas, with the intention of offering an alternative to revolutionary socialism.

After 1945, however, the central state grew rapidly, and it gained control over a vast array of nationalized firms. A comprehensive welfare state was put in place that continued to grow for several decades afterward. The

social and economic policies of all governments, even those nominally conservative, tilted noticeably to the left. For a while, it seemed as if liberalism had been buried. In fact, there were almost no political philosophers capable of arguing about political issues and priorities insofar as the dominant schools of philosophy at that time, including Sartre's synthesis of Marxism and existentialism, were premised on the notion that politics is entirely conditioned by historical and economic forces beyond the control of bourgeois governments. This is not to say that politicians escaped criticisms at the hands of writers, artists, influential editorialists, academics, and so on. But the criticisms were mostly concerned with the mismanagement of the Algerian war or foreign policy issues related to the conduct of the Cold War.

There were a few exceptions to these trends. One was Albert Camus. Another was the (philosophically well versed) sociologist Raymond Aron. Through his widely read novels, Camus offered a vigorous defense of the ideal of liberty and although he shared with Sartre similar premises about the absurd character of life, criticized Sartre's contradictory merging of existentialism and communism. Aron was closer than Camus to being a political philosopher, but he was not taken seriously by most *engagés* intellectuals and cultural critics. (Today, however, scholarship about Aron is quite extensive.) His audience in the general public and the governing elites was far wider, but the latter focused primarily on his denunciation of orthodox Marxism and Soviet diplomacy. They downplayed his subtle analyses of the importance of a variety of freedoms in the economic, social, and political spheres to which they were more likely to pay lip service to than to embrace.

As a result of a conjunction of events that included the fall of the Soviet bloc, the absence of American entanglement in overseas operations, and domestically, the failure of the economic policies pursued by the Socialist party in power under President Mitterrand between 1980 and 1983 to which Mitterrand himself responded by giving free rein to his ministers to move in the direction of privatization and deregulation (including of the mass media)—there was a brief period during which something akin to an intellectual revolution unfolded. In a word, liberalism returned to the forefront of the intellectual scene. This return was not the doing of right-

wing libertarians, but primarily the result of new departures taken by formerly leftist historians and philosophers who abandoned their antiliberal prejudices.

Two overlapping strands of thought were at work. The first was centered on a revisionist historiography of the French Revolution put forward by François Furet and Mona Ozouf in several carefully researched pieces that emphasized the significance of the liberal element of the original revolutionary impetus and described 1793 as the betrayal of that ideal. This was an attack on the line of thought successfully defended until then by most historians of the Revolution, and notably Soboul, according to which the spirit of 1793 embodied the true meaning of the revolutionary era. The second strand is more properly philosophical and also more multifaceted. In brief, it consisted of efforts by thinkers such as Claude Lefort, Pierre Manent, Alain Renaut, Pierre Rosanvallon, Marcel Gauchet, Blandine Kriegel, Sophie Masure, among others, to rethink politics as something central to the human experience that cannot be reduced to political economy, as it tends to be for Marxists, nor to the manipulation of empty symbols as some postmodernists would have it. In liberal democracies, what politics ought to be most concerned with is the promotion of human rights. Although not prompted by John Rawls's reflections on similar subjects, this program of research naturally led to a belated engagement with American liberal egalitarian political philosophers (e.g., Rawls, Ronald Dworkin, and Michael Waltzer).

While these individualistic currents are still alive in academic circles, their reception in the educated public has encountered renewed obstacles in more recent years—a trend that has accelerated as a result of the economic crisis of 2008 and its ongoing effects. In that context, the popularity of new forms of progressive thinking have surfaced. Most notably, there is renewed interest in Pierre Bourdieu's theses on the significance of the unequal transmission of cultural capital in the structuration of hierarchies of power. Another noteworthy current is the ethics of care promoted by Anglo-American feminists (e.g., Carol Gilligan, Nel Noddings) and adopted by French sociologists and espoused by a few prominent French socialists, notably Marine Aubry.

Political Thought and Political Realities

The long shadow cast by the French Revolution was in part attributable to the manner in which the theories of great thinkers resonated in actual political life. For quite some time it set a pattern that defined the unique character of French politics and French political thought. Philosophers, essayists, and political leaders interacted in a very public way and the public—or at least, the literary public observed these jousts with great interest. This situation has changed, perhaps not radically, but significantly.

French-speaking philosophers and social scientists in France and elsewhere, just as in the English-speaking world, have become more professional and more specialized. They are more likely to correspond with colleagues halfway around the globe than with their nonacademic fellow countrymen. And the trend has been toward the adoption of ways of discussing problems that are analytic rather than holistic and speculative, even though critical approaches (which tend to be more holistic) are firmly rooted in French academia.

Nonetheless, there are at least two areas in which professional thinkers have stepped out of their ivory towers. The first is broadly defined as the set of interrelated questions that bear on immigration, multiculturalism, and religious tolerance; the second has to do with the consequences of globalization for the French model of the welfare state.

On the question of accommodating cultural differences, philosophers (e.g., Pierre-André Taguieff, Vincent Peillon, Luc Ferry) have joined a chorus of editorialists and essayists who, in spite of significant nuances, uphold the uncompromising secularism that has led the French state to ban the Islamic veil in public schools and more recently, wearing the burka in any public venue. The central theme of these interventions is that the republican ideal of citizenship precludes granting special status to any group.

With respect to globalization, the range of publicly expressed views is arguably somewhat wider (the blogosphere offers an impressive diversity of views). But for the most part, intellectuals from different backgrounds tend to support the popular sentiment echoed in the media that ultraliberalism

(i.e., arguments supportive of free markets) must be resisted and that public policy should, by all means, be aimed at the protection of the institutions and practices of the French welfare state.

Two concluding observations are in order. The first is that absent in these debates are the epic clashes of views that earlier generations witnessed (e.g., Sartre versus Aron on communism, Barrès versus Anatole France in the Dreyfus affair). Although French intellectual life continues to be rich in ideas, public intellectuals no longer think of themselves as the standard bearers of antagonistic ideologies and the public no longer expects them to act in that way. The second is that these two issues signal a tendency toward retrenchment, a feeling that French institutions and way of life in general are threatened. French intellectuals have lost the optimism and the conviction that animated thinkers of an earlier age that France had a message for the rest of the world. Sartre was probably the last intellectual cast in that mold.

French Revolution, Political Thought of the

The French Revolution of 1789 and the events that unfolded until Napoleon Bonaparte proclaimed himself emperor in 1804 still occupy an important place in the mythology of Western civilization. While its effect on the course of history faded away gradually, it continues to be an inescapable point of reference in the history of political ideas. What the Revolution means, however, depends very much on the period or actors one singles out. Very different conclusions can be drawn from a reading of the *Declaration of the Rights of Man and the Citizen* or the speeches of Maximilien Robespierre. Iconic figures such as Honoré Riqueti de Mirabeau, George-Jacques Danton, Louis Antoine de Saint-Just, or Napoleon Bonaparte symbolize different episodes and currents whose influence and significance ought to be parsed carefully. Civic republicanism, liberalism, socialism, as well as conservatism, were shaped to a large extent by the ideas that inspired the revolutionaries, by the manner in which they appropriated them, or by the reactions and counterforces they unleashed.

Phases of the Revolution

Roughly speaking, the Revolution went through four phases: the early stages from the events of 1789 to the trial of Louis XVI and the proclamation of the Republic; the Terror (1792–94); the Thermidorian

reaction and the Directory (1794–99); and finally, the Consulate and the rise of Bonaparte (1800–04). In what follows, let us consider the ideas that best characterize these stages, the previous ideas to which they can be traced, their posterity, and the critiques and reaction they evoked. The philosophical views and political-economy doctrine that dominated the first period are embodied in two documents: the already cited *Declaration* and the *loi Le Chapelier*. The former is an interesting amalgam of classical liberal and utilitarian concepts (e.g., the general good or the good of all), but although the style is mostly Lockean, it also includes a few references to ideas usually associated with the works of Jean-Jacques Rousseau (e.g., “law is the expression of the general will”). The preamble states, “The rights of man are natural, unalienable and sacred.” Article 2 declares them to be “liberty, property, security, and resistance to oppression.” It is interesting that the right to property is thereby declared to be sacred in view of how quickly, under the influence of the Jacobin-dominated *Commune de Paris*, the revolutionary government moved toward measures such as price controls and the seizure of the properties of the enemies of the republic. Nonetheless, the 1789 Declaration stands out in this regard; not even the Bill of Rights in the American Constitution elevates property rights to this exalted status, although the Fourth and Fifth Amendments, respectively, provide strong protection against illegal seizure and guarantee compensation for property taken for public use. (And it should be added that James Madison did occasionally use the term *sacred* to describe property rights.) The Declaration also guarantees all the civil liberties that have become the hallmark of liberal democracies: equality before the law, protection against arbitrary imprisonment, freedom of religion, and freedom of expression. Liberties, however, remained largely ignored in several of the regimes that emerged in France a few years after the proclamation of the Declaration until they were finally given a firmer basis under the Third Republic (1870–1940).

By abolishing the medieval guilds, the *loi Le Chapelier* of 1791 created an unregulated labor market and established the conditions for the free exercise of the profession of one’s choice. It also served throughout much of the nineteenth century as the legal foundation for the prohibition of trade unions, which were not granted legal status in France until 1884. But while economic liberalism was less challenged in the succeeding years than

political liberalism, it was briefly threatened during the tumultuous years of the Jacobin Terror.

Had he lived through this era, Rousseau would probably have been horrified by the manner in which his ideas were used to justify the tyrannical regime of the Committee of Public Safety, specifically by Robespierre and Saint-Just. Yet even after these men's defeat, French republicanism, which under a succession of monarchical regimes struggled to hold onto its revolutionary roots, continued to be quite distinct from the Anglo-American republican tradition (from James Harrison in seventeenth-century England to Thomas Jefferson). The republicanism that appealed to French revolutionaries was typically neo-Athenian although a less vocal minority (who arguably became more dominant under the French Third Republic at the end of the nineteenth century) also defended a more neo-Roman vision, to use a typology that is commonly found in the literature on civic republicanism. The former insists on a creative style of politics and glorifies an actively engaged citizenry; the latter places more emphasis on the rule of law and a less active, albeit attentive and civically minded, public. Robespierre and Saint-Just were mostly impressed—even obsessed—by Rousseau's comments on civic virtue and the purity of the general will, which in their eyes justified the persecutions they visited on enemies whom they portrayed as impure.

The Terror came to an end in 1794 when the Jacobins were removed from power by the leaders of the Thermidorian reaction. All of the latter were members of the Convention, that is to say members of the assembly that Robespierre had mesmerized for the two years, but once in power they abandoned much of the Jacobin rhetoric. However, because of their own past as regicides, because of the climate created by the war efforts, and because of a resurgence of monarchist sentiments, they remained firmly committed to republicanism. They innovated, however, by trying to steer an ambiguous political and intellectual course away from the neo-Athenian republicanism of the Jacobins and toward something that resembled more neo-Roman ideals, for example, by adopting the concept of a bicameral legislature as a way to put in place constitutional checks and balances. The Directory enshrined these ideals, being founded on the revised constitution (*Constitution de l'an III*) that the Thermidorians had crafted. It was during

this era that Benjamin Constant began what would become a lifelong defense of classical liberal principles. From these he tried, not always successfully, to derive practical conclusions applicable to the politics of the moment. His first important political work was *De la force du gouvernement actuel et de la nécessité de s'y rallier* (1796) in which he attempted to legitimize the institutions of the Directory.

Paradoxically, it was also during this era, when bourgeois values and mores were well on their way to becoming the new normality, that an early forerunner of communism appeared on the political and intellectual scene. Gracchus (as he liked to call himself) Babeuf had been before 1789 a *feudiste*—that is, a member of the legal profession whose role was to ascertain on behalf of their aristocratic clients claims to contested privileges of nobility. He experienced severe setbacks in exercising this profession, leaving him with a deeply felt contempt for the aristocratic class and probably explaining in some measure his zeal for the pursuit of social equality. Because he spent much of the period prior to the Thermidorian reaction in jail (he had to fight accusations of fraud that had nothing to do with politics), he erupted on the political scene at a time when the egalitarian forces represented by the *sans-culottes* who had supported Robespierre were waning but when, nevertheless, food shortages were creating much resentment among the poor. In the pages of the journal he founded, *Le Tribun du Peuple*, Babeuf defended a conception of equality that went far beyond the rhetoric of equal rights by proposing an equal sharing of land resources. But his political role was short lived; in May of 1796 he joined the conspiracy of equals, which was quickly put down by the police, and after a lengthy trial, he was executed in 1797. Nevertheless, Babeuf was seen as an iconic figure by the revolutionary left and by the early European socialists throughout much of the nineteenth century.

Napoleon and After

The defeat of the Babouvist conspiracy solidified the power of the conservative republicans, but in their efforts to achieve social and political stability, they entered into a Faustian bargain with Napoleon Bonaparte, who proceeded in 1799 to overthrow the Directory and replace it with the Consulate. That regime was only a vehicle for his ambitions, and he

crowned himself Emperor in 1804. The cult of authoritarian leaders that plagued the twentieth century has its roots in the Napoleonic adventure. Nevertheless, it is inappropriate to lump together Napoleon and fascist dictators insofar as Napoleon was still a product of the French Revolution and of the rationalism of the Enlightenment. Although always ready to bend and twist the meaning of the motto “liberty, equality, fraternity,” he never sought to radically subvert these principles. While he reestablished titles of nobility, for example, he adhered to the idea of equality before the law so that such titles were merely honorary. In fact, he took pride in his work drafting the code civil prohibiting privileges based on birth and more generally, establishing a solid foundation for property rights and commercial life. In the final phase of his meteoric career, during the so-called hundred days after his return from Elba in 1815, he even called upon Constant to help him draft the constitution of a liberal parliamentary monarchy. In spite of the parallels evoked by the Napoleonic cult of charismatic leadership, the corporatist ideology and extreme elitist tendencies that defined fascist Italy under Benito Mussolini, Spain under Francisco Franco, and Portugal under António de Oliveira Salazar, owed more to the counterrevolutionary theories of thinkers such as Joseph de Maistre (1753–1821) and Louis de Bonald (1754–1840) than to Napoleon himself. Nevertheless, Napoleon’s conquest of Germany provoked an ethnic nationalism among German philosophers such as Johann Gottfried Herder that ultimately contributed to the idiosyncratic National Socialism of Hitler. In the Anglo-American world, this current of thought took a less virulent form under the pen of Edmund Burke, who condemned the Revolutionaries’ belief that they could reorganize society on the basis of reason alone but did not call for a return to absolutism.

In brief, the legacy of the French Revolution in the domain of ideas is complex and somewhat indeterminate. It includes elements of classical liberalism (the spirit of 1789) and republicanism, but the interpretation of the latter oscillated between Rousseauian or neo-Athenian currents that veered into revolutionary zeal and intolerance and neo-Roman currents that spoke in more restrained tones about constitutional checks and balances and the rule of law. (In his famous *On the Liberty of the Ancients Compared to That of the Moderns*, Constant draws a similar contrast.) The Revolution also planted the seeds of both radical egalitarianism and modern

authoritarianism. Recent historiography, notably in France, has sought to reevaluate the significance of the less revolutionary and more liberal sides of this legacy but the fact remains that the events of both 1789 and of 1793 continue to define this ambiguous period. An indirect legacy of the Revolution took the form of a reactionary political thought that claimed to return to the values of the *ancien régime* while actually introducing into European political philosophy a new form of irrationalist intransigence that rejected all aspects of the liberal faith in individual freedoms and social progress.

Freud And Social Theory

Freud and Social Theory

Sigmund Freud extended psychoanalysis from an individual psychology and therapy to a broad sociopolitical theory that provided a history of civilization and strategies for addressing various social problems besetting Western societies. In a diverse set of writings, ranging from the prevention of war to sexual mores, he offered what he believed were scientific, rational strategies that employed psychoanalytic tenets to reform repressive society. And beyond these therapeutic efforts, he suggested historical accounts of the origin of primitive societies, the role of religion, and the general development of civilization as resulting from the same psycho-dynamics he had discovered in individuals. Freud maintained throughout his cultural and historical works a cautious hope about the future of humankind, if through education and a more tolerant policy toward sexuality, the self-destructive forces of human nature might be turned into constructive cultural enterprises.

Some even find in Freud a modestly utopian vision, based on science as a promoter of the Enlightenment ideals of reason and autonomy. By contrast, postmodern and feminist thinkers, as well as behaviorists such as B. F. Skinner, express skepticism about each of these ideals. Both Freud and many of his critics begin with the fundamental issue of the extent to which neurosis—or self-limiting psychic conflict—arises from inner maladjustment (inadequacies of the individual) versus the repressive role of society, which then becomes the primary culprit in producing neurosis. This debate, framed by Freud himself, involves the possibility of self-exploration

according to psychoanalysis as well as its applications to the betterment of society as a whole. It has dominated much of twentieth-century social theorizing.

Freud's Social Writings

Freud's engagement in explaining social phenomena and their historical origins ranged widely, extending from the origins of religion and morality to the sources of social order and disorder and from the psychodynamics of cultural development to the relationship of human nature and culture. Building upon his insights derived from psychoanalysis, he sought to improve society by reducing psychic conflict, a task that depended on releasing excess repression, both socially and intrapsychically. With successful psychoanalysis, a modified self-image and altered behaviors allowed individuals to become more socially adaptive. Freud's meliorism, extending from the individual to society-at-large, cautiously promoted enhanced freedom and social well-being, balanced against his own understanding that discord and aggression were inextricable from human congress.

Although the later works, notably *Future of an Illusion* (1927) and *Civilization and Its Discontents* (1930), are Freud's most often cited social-theoretical writings, in fact these interests date at least to his university days and persisted throughout his career. His first published foray into social criticism, "Sexuality in the Aetiology of the Neuroses" (1898), a diatribe against bourgeois sexuality, closely coincided with his creative eruption around the writing of *Interpretation of Dreams* (1900). Freud did not offer an extended extrapolation of psychoanalytic theory until ten years later with the publication in 1908 of "'Civilized' Sexual Morality and Modern Nervous Illness" in which he drew together various themes to expressly link sexual repression with neurosis and perversion. The correlation between the tensions of modern life and nervous disorders was hardly a novel insight, but the direct relationship to sexual repression extended Freud's own theory of psycho-sexual development and expression to the larger cultural context.

The other side of the repressive equation was the inability of the subject to adapt to the demands of reality—that is, the weakness of the ego became

the decisive factor. Once Freud shifted from focusing on sexual theory to the beginnings of an ego psychology with “On Narcissism” (1914), he was led to a more complex social psychology, which dominated much of his thought for the next twenty-five years.

The mechanisms Freud invoked in the writings prior to *Totem and Taboo* (1913) reflected the push-and-pull of Newtonian mechanics that characterized his instinctual theory, which was framed by the exclusive focus upon sexual frustration. However, in *Taboo* Freud began to move toward an ego-oriented psychology. With this inflection in his theory, he argued that the social instincts are not primary, but emerge as the product of a combination of egoistic and erotic components contextualized and expressed within the social context. Rooted in the primal crime (or fantasy) of killing the father, the social bond among the murderous brothers is in precarious balance with the aggression of self-assertion.

A “solution” is offered in *Group Psychology and the Analysis of the Ego* (1921), albeit with highly mixed results: Only love can overcome the individual narcissism and hatred that divide people, and thus, the adored leader not only unites the nation under a collective identity, but marshals aggression to release a collective need. Within the context of fascism, Freud hoped that the lessons derived from psychoanalytic theory would free the individual from this group bondage and build an individualized, free psychology. Thus, whether led by Jesus or Adolf Hitler, the individual must be freed by unmasking the infantile nature of passion for authority.

The Future of an Illusion (1927) may fairly be regarded as the most optimistic of Freud’s social writings. He begins with the bald assertion that every individual is an enemy of civilization because human nature is instinctively destructive. Society, of course, must impose socially integrative behavior, but then Freud states the central challenge that organizes all of his reform efforts. As he first stated in 1898, and now continued thirty years later, Freud condemns society for its excessive controls, and more specifically, he bewails the psychic imprisonment imposed by excessive repression, not only for the price extracted on individual human happiness, but for the inevitable failure of that repression. The toll ranges from emotional disquiet, to neurosis, to self-destructive and

antisocial behaviors, and most catastrophically, to war. A core philosophical point organizes this reformist and arguably utopian vision—the triumph of science and reason:

The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. (Freud 1953–74, 20:53)

Indeed, “There is no appeal to a court above that of reason” (ibid., 28), and from that position, Freud mused about a reformist-utopian psychology, whereby, as suggested later by Frankfurt school critical theorists, a liberation politics might emerge from psychoanalytic insight (see Moss 2005).

Freud’s assertions were bold. His social theory followed a basic template: by applying a therapy that worked on his patients (and thereby also validated his theory), he then extrapolated the individual drives to the selfsame forces that operate in the collective aggregate. In the simplest scenario, repression of the erotic caused psychic conflict, instinctual imbalance, misplaced objects of emotional investment, and ultimately self-destructive effects. On this view, the very structure of psychoanalytic thinking potentially embeds a utopian revision of Western culture, inasmuch as individuals might shepherd their destructive drives to a better balance with the erotic, with the result that individuals could flourish in a transformed society organized around a proper balance of work and pleasure, as opposed to repressive control based on what Herbert Marcuse later called the performance principle. So at least Freud thought at the time. Three years later, he seems to have become more pessimistic.

Civilization and Its Discontents (1930) addresses the psychic dynamics of human aggression, which, beginning with *Beyond the Pleasure Principle* (1920), Freud came to depict as the displacement onto others of the death instinct, perpetually at war with the libidinal and egoistic life instincts.

Conversely, humans build relationships and culture in service to Eros, and thus, a fundamental conflict characterizes civilized life. Inasmuch as Eros and Thanatos, or the death instinct from which the aggressive drives derive, are pitted against each other, the psychoanalytic story of civilization is the history of erotically enlisted constructive forces in chronic battle with the destructive death instincts. The work ends with a famous (or infamous) nonconclusion:

The fateful question for the human species seems to me to be whether and to what extent cultural development will succeed in mastering . . . the human instinct of aggression and self-destruction. . . . Eros will make an effort to assert himself in the struggle with his equally immortal adversary. But who can see with what success and with what result? (Freud 1953–74, 21:145)

Within this complex play of forces, humans must find their own way—that is, no universal, general formula exists as two vectors must be accounted for, namely, (1) the restrictions on individual freedom imposed by the strictures of society, and (2) the successful deployment of sublimation, a culturally approved form of displacement that not only redirects libidinal energies for individual satisfaction, but becomes the crucial element in forging the collective into a cohesive social whole. Simply, sublimation and its accompanying work ethic push individual interests into synchrony with the group's own welfare.

The Ethics of Freudian Social Theory

The success Freud witnessed through analysis convinced him that an alternate mode of acculturation was possible based on the insights psychoanalysis offered. Despite Freud's well-known pessimism about the effective control of the instincts, in particular the destructive death instinct, he suggested that the complex dialectic of their interplay and the implicit balance that must be attained for individual and social health remained a therapeutic and societal possibility. Indeed, as Abraham Drassinower (2003) observes, the acceptance and integration of the death instinct are

both an ethical and existential task, which if denied (in Freudian terms) leads not only to a thwarted life, but also to neurosis. On this view, Freud's theory of culture is an inquiry into the viability of the species, which then becomes a fateful and ethical task.

Freud's theory embraces two partially conflicting metaphysical positions: one derived from Freud's scientific training: the causation witnessed in the natural world, coupled to his naturalism, made him substantially a determinist. The other stance, derived from his humanistic metaphysics, regarded humans as endowed with a consciousness that is inspired by hope and that employs reason to navigate the world—psychologically, socially, and biologically. Because significantly deterministic unconscious forces comprise the central tenet of psychoanalytic theory, wherever in his writings Freud discusses free will, he cautions that such freedom is limited. The promise of psychoanalysis builds upon the ability of reason, albeit with emotional recognition and reconciliation, to reveal the secrets of unconscious drives and thereby better live with them. Freud's central therapeutic insight, that the self-understanding gained by free association in analysis can be curative of self-limiting psychic conflicts, offered a degree of potential freedom and psychic health to the individual, as well as hope for a less repressive and less conflictual society. Thus, psychoanalytic theory is based both on a central paradox—we are determined, yet free—and on a therapeutic method for at least partially resolving the paradox.

Broad philosophical issues emerge from this position, for beyond the epistemology bequeathed by Freudianism, a powerful metaphysical challenge has also been offered, namely, the precarious status of human autonomy (mediated and constituted by the faculty of reason) raised by uncovering unconscious processes that are nonrational. To the extent that the ego as a monitoring system feels free, it does so as a consequence of its epistemological location and function as an observer of deeper mental functions. In some sense, this so-called freedom is required to fulfill its judgmental role. Yet according to Freudian tenets, deterministic unconscious forces often trump the ego's conceit.

Regarding the larger metastructure of Freud's thought, he was committed to the Enlightenment ideals of reason's power, the improvability of

humankind, and, from the vantage of a physician, the therapeutic promise of analysis. The essential feature of these projects rests upon the central paradox underlying psychoanalysis—we are determined yet free: “Analysis does not set out to make pathological reactions impossible, but to give the patient’s ego the *freedom* to decide one way or the other” (Freud 1953–74, 19:50; emphasis in original). The powerful unconscious, whose demands will not easily be denied by “the proud superstructure of the mind” (Freud 1953–74, 17:260), of course, is a central tenet of psychoanalysis, so Freud leaves a perpetual conflict at the base of his theory.

Freud’s therapeutic ethos offered the possibility of rational self-understanding and thereby of psychological health and improvement. By extrapolation of individual psychology to the social group, Freud also envisioned the possibility of transforming society for the better. What was required, he argued in *The Future of an Illusion*, was the replacement of illusionary individual and collective defense mechanisms such as religion with the curative potential of scientific understanding. On this view, Freud can be read as both a child of the Enlightenment and a futuristic apostle of humanism.

Conclusion

In *The Future of an Illusion*, Freud both took note of and remained agnostic about the future of the socialist experiment then ongoing in the Soviet Union. His low opinion of the masses and his circumspect view of the prospects for utopian change nevertheless were offset by glimmers of hope. The Freudian prescription, based on analytic insight, modeled social reform on psychoanalytic success: identify the unhealthy repression and free it to allow a healthy expression of the erotic. For those who have accepted the Freudian theory of psychic dynamics, the lessons learned provide an important orientation for social reform. How, in fact, better psychic balance and healthy release of unrequited desire would be achieved and how such a massive reformation of obstructive social forces might be accomplished, Freud did not predict. However, Freud’s fundamental teachings inspired later political theorists such as Michel Foucault, Gilles Deleuze, and Herbert Marcuse to develop their own philosophies in response to our era’s dominant theoretician of human nature and society.

Friedman, Milton

Although he is primarily thought of as an economist, Milton Friedman (1912–2006) had a considerable impact on political thought and political practice in the latter half of the twentieth century. He was a prolific writer, and his output ranged from technical and specialist pieces on economics to writings targeted for popular appeal. His most notable work is *Capitalism and Freedom* (1962), while *Free to Choose* (1980, written with Rose Friedman), and *The Tyranny of the Status Quo* (1984, written with Rose Friedman) are also books for a general audience that espouse Friedman's political and economic ideas. In addition, *A Monetary History of the United States, 1867–1960* (1963, written with Anna J. Schwartz), although ostensibly a work of economic history, had a significant bearing on monetarist political economy.

Friedman was born in Brooklyn, New York, and his family relocated to Rahway, New Jersey, when he was just one year old. His parents were Jewish immigrants to the United States and were not well off financially. Friedman attended Rutgers University on a scholarship to study mathematics and graduated in 1932. He then completed an MA in economics at the University of Chicago, an institution that he would come to be most associated with, in 1933, and it was there that he met his future wife, Rose Director. Friedman went to work for the National Resources Committee before being hired by the National Bureau of Economic Research in 1937, a position that afforded him the financial security to marry Rose in 1938. During World War II, he was employed by the

Treasury Department and created the withholding tax system in the United States before being awarded a PhD from Columbia University in 1946, capped by his dissertation, *Incomes from Independent Professional Practice*.

Friedman returned to Chicago in 1948 as Professor of Economics and would remain there until 1977, during which time he received the 1967 Nobel Prize in Economics and became the influential leading light of the Chicago school of economics. He worked as an economic advisor to Ronald Reagan during his 1980 presidential candidacy and went on to serve on the President's Economic Policy Advisory Board following Reagan's election. The 1980s were the height of Friedman's fame, and his economic ideas held considerable stock among a number of right-of-center governments across the world, especially the Reagan administration in the United States and Margaret Thatcher's government in the United Kingdom, although many conservatives balked at Friedman's libertarian attitude to social questions such as drug control. Friedman died in San Francisco, California, in 2006 at the age of 94.

Friedman's political thought and his economic philosophy are intricately linked, and it is not feasible to discuss one without the other. As Friedman wrote in *Capitalism and Freedom*, the view that politics and economics are separate and unconnected is a delusion, and only a few combinations of economic and political arrangements are possible. Simply put, his conviction was that capitalism promotes freedom while socialism suppresses it. Moreover, he opposed the Keynesian consensus that dominated political economy between the end of World War II and the close of the 1970s. In its place, he advocated a macroeconomic policy known as monetarism that argued for the role of the state to be reduced to little more than the regulation of the money supply to ensure that monetary supply and demand were in equilibrium. In Friedman's ideal, a body free from political interference should undertake this role.

Friedman's economic view had political ramifications beyond the technical realm of money supply. By favoring a less regulated approach to capitalism, Friedman argued for a less interventionist role for government in the economy. In particular, he argued that legally enforced monopolies, such as

that of the U.S. Postal Service, should be opened up to private competition. Friedman did not, however, oppose a public monopoly in all cases, acknowledging that technical monopolies may exist and that in such a case economic freedom is not necessarily harmed. He also proposed state funding for some private schools to supplement the education system, argued that a negative income tax (i.e., an income subsidy for the poor) would be more equitable than other forms of welfare redistribution, supported the relaxation of drug controls, and vociferously criticized the idea of a conscript military. The common thread throughout Friedman's political thought was the goal of freedom of choice.

The most obvious influences on Friedman's thought were Frank Knight, Jacob Viner, and Henry Simons, all prominent economists associated with the Chicago school. The impact of the Austrian school on Friedman is also readily apparent, especially the work of Ludwig von Mises and Friedrich Hayek. Friedman's own influence has been wide-ranging and can be observed both in politics and economics. Among the most notable followers of aspects of Friedman's thought are Thatcher, Reagan, and Ben Bernanke, alongside the Chicago school's adherents.

Game Theory

Game Theory

Game theory is the mathematical analysis of strategic-decision problems in which at least two decision makers (or players) choose alternatives that produce an outcome that affects all decision makers involved in the problem (or game). The analysis of a game hinges on knowing (and assuming that the players all know) how the players' choices lead to the possible outcomes of the game and how each player values the possible outcomes relative to one another (i.e., their preferences). The main assumption is that the decision makers are purposive, choosing actions that are most likely to get them to their objective given the structure of the game and understanding that the other decision makers are pursuing their own objectives. This assumption is known as the *economic rationality* (not to be confused with other notions of rationality in political theory).

Game theory is actually a set of tools and not a theory in its own right. The theorist needs to insert the objective whose consequences she or he wishes to explore. In economics, this objective is usually profit maximization. In politics, two common objectives are office seeking and policy goals; these may even inform each other in that an office-seeking politician may choose particular policy goals in her or his drive to gain or retain office. In international relations, many objectives have been credited to states: power, security, national wealth, and survival.

The political application of game theory has its earliest roots in the works of Thomas Hobbes, John Locke, and Jean-Jacques Rousseau. Hobbes, in

particular, may be read (cf. Gauthier 1969; Kavka 1986; Skyrms 1990; Binmore 1995) as having postulated a world in which individuals faced what modern game theorists would call a prisoner's dilemma. In its simplest form, two individuals choose between cooperating with or defecting against one another. Each is assumed to be best off by defecting if and only if the other chooses cooperation; mutual cooperation is next best; mutual defection is third best; cooperating when the other defects is worst. It is a dilemma in the sense that thinking about only shortterm, economic rationality leads both individuals to defect, but each individual logically prefers mutual cooperation over mutual defection.

A game-theoretic solution to the prisoner's dilemma is to recognize that most social interactions are not short-term, but are repeated frequently (cf. Taylor 1976; Axelrod 1984). When individuals put sufficient weight on future interactions, mutual cooperation becomes possible (even for narrowly egoistic decision makers) without requiring an outside enforcing actor. While cooperation under this anarchic condition becomes possible, it is by no means assured. Actors putting insufficient weight on future interactions or seeking short-term gains may continue to defect. If this segment of the population becomes sufficiently large, it can have a cascading effect such that cooperation in society breaks down. In this way, Hobbes was quite right to recognize that entering into a covenant may be easier than maintaining it over time.

Game theory, through social-choice theory, raises issues for democracy as well. Kenneth Arrow (1951; cf. Black 1948) proved that a voting system could not be both fair (applying ideas of social-preference desirability derived in part from Condorcet) and nonmanipulable. As many of the voting systems used by nations and by legislatures can be manipulated by a minority of actors (leading William Riker [1986] to argue that politics is really about heresthetics, or the art of political manipulation); this impossibility theorem questions the value of democracy. The selectorate theory of Bruce Bueno de Mesquita and colleagues (2003) provides a defense of democracy. Building on the observations of David Hume (from his essay "Of the First Principles of Government" 1748) that even the "soldan of Egypt, or the emperor of Rome, might drive his harmless subjects, like brute beasts, against their sentiments and inclination: But he

must, at least, have led his mamalukes, or praetorian bands, like men, by their opinion,” they argue that all leaders care about their political survival. Depending on the institutional rules they find themselves in, they go about achieving their political survival in different ways. Most basically, authoritarian leaders (like the soldan of Egypt or the emperor of Rome) provide private benefits to their closest supporters to maintain the supporters’ favorable opinion. Democratic leaders, according to their argument, have too many such supporters to provide meaningful private benefits; therefore, they provide public goods that benefit not only their supporters, but also the country as a whole.

It is important to remember that the “good” outcome or society is still defined by the theorist. While we may generally want people to cooperate to have a harmonious society, we may equally, for the benefit of the larger society, wish for prisoners and malcontents to be prevented from cooperating with each other.

Gandhi, Mohandas (Mahatma)

Mohandas Karamchand Gandhi (1869–1948) became, from 1919 to 1947, the most prominent leader of the Indian movement for national independence from British imperial rule. He is renowned for having developed a theory and practice of nonviolent thought and action that he called *satyagraha*. This term, coined by Gandhi as early as 1907, combined two words from ancient Sanskrit: *satya* (truth) with *agraha* (adhering to firmly). He translated *satyagraha* into English as the nonviolent force of truth and love when these qualities were fully realized and applied to the transformation of politics and society.

The Essence of Gandhi's Thought

Gandhi distinguished his method of action from passive resistance, a term used by the suffragettes that he deemed misleading because it failed to convey the intensely active power of nonviolence. Gandhi insisted that *satyagraha* was so powerful that it could and must “exclude every form of violence, direct or indirect, and whether in thought, word or deed” (Gandhi 1996, 29). If the leader and the people do not have a belief in nonviolence as both a creedal and pragmatic imperative, violence might seem like the only way to resolve conflict. Martin Luther King Jr. who adopted Gandhi's methods in America, correctly emphasized that to understand nonviolent methods of social change, it is essential to start with a study of Gandhi's philosophy of *satyagraha*.

This point about grasping the unity of Gandhi's theory and practice was underscored by Howard Gardner (1993), in *Creating Minds*, when he compared Gandhi with Sigmund Freud, Albert Einstein, and Pablo Picasso and contended, "Gandhi was a thinker of the highest order. The conception of *satyagraha* was worked out as carefully as a philosophical system, with every step and its possible consequences carefully calibrated" (355).

India, and eventually the world, knew him as the "Mahatma" or "Great Soul" because outstanding among political leaders, he represented high moral or spiritual virtues as well as an effective use of political power. Gandhi expressed his ideal of nonviolence when he said, "Be the change you wish to see in the world." He believed that social transformation must come from within each individual: violence emanates from internal hatred or insecurity. Purging negative thoughts associated with anger or hatred is necessary because such sentiments undermine our capacities for peaceful conduct. The value of this insight has been developed by the psychologist Barbara Fredrickson in her work *Positivity* (2009). Her work, along with that of Gardner and Martin Seligman, offers a focus on positive emotions, which parallels Gandhi's reinforcement of nonviolent attitudes.

The only way for nonviolent power to be waged is through love, love of oneself, of others, and of peaceful change. Gandhi wrote that *ahimsa* "means the largest love, greatest charity. If I am a follower of *ahimsa*, I must love my enemy" (Gandhi 1996, 40). Gandhi taught that love was ultimately more powerful than hate, but in order to love one another, one must first love oneself, a quality often missing in people who have been victimized and oppressed. Gandhi's first step in advocating nonviolent resistance, therefore, was to heighten Indian self-esteem. The British Empire had dominated India for over a hundred years and had derided Indians as cowardly, passive, and weak. Gandhi told them that they possessed loving and compassionate attitudes that embodied the highest form of strength. Weak people exploded in anger and sought self-protection in weaponry; it takes superior strength to arm oneself instead with restraint and empathy. Indians, if they could transform their anger toward the British colonizer into empathy, would become more disciplined for *satyagraha*.

Gandhi's central justification of nonviolence was that all humans are made of the same infinite spirit that we are all interconnected, and by extension, one cannot harm another without harming oneself. Gandhi believed that once we see the unity of all beings, violence is impermissible because we are all part of one another, and thus to harm a person means inflicting injury on oneself. This verse from the *Bhagavad Gita*, the supreme sacred text of Hinduism, captured Gandhi's ultimate sanction for nonviolence:

Arming himself with discipline, seeing everything with an equal eye, he (the sage) sees the self in all creatures and all creatures in the self. (vi. 29)

Aware of this passage from his favorite text, Gandhi wrote in *Young India: A Weekly Journal*,

I do not believe that an individual may gain spiritually and those that surround him suffer. I believe in the essential unity of man and for that matter of all that lives. Therefore I believe that if one man gains spiritually, the whole world gains with him, and if one man falls, the whole world falls to that extent. (December 4, 1924, 398)

The goal of a political movement is to attain liberation: freedom from grievances imposed by an oppressive government. Through nonviolent action or civil disobedience, a people can attain liberation both internally and internationally, by learning to see the essential truth that is the unity of humanity. It is this realization that brings freedom in the fullest sense. Gandhi's accomplishment of liberating India from British colonial rule showed that there is power in nonviolent action and that civil disobedience to obtain change can be expressed in the most peaceful of means without harming the physical or mental integrity of another human being. In fact, Gandhi believed that nonviolence was more effective than violence. He wrote, "Power is of two kinds. One is obtained by the fear of punishment and the other by acts of love. Power based on love is a thousand times more effective" (Gandhi 1996, 29).

Gandhi's Personal Development

Gandhi was born on October 2, 1869, into an affluent Hindu family in the city of Porbandar on the west coast of India. He was the youngest of five children. His father, Kaba Gandhi, was an influential political figure, having served in several public positions. Gandhi described him as “truthful, brave and generous, but short-tempered.” Being quick to anger is a severe judgment in Gandhian terms, especially when he contrasts his father’s behavior with the flawless patience and unconditional love expressed by his mother. She is portrayed as faultless: “deeply religious” to the point of “saintliness,” shown especially in her limitless spirit of self-sacrifice for her family. He makes clear that the decisive influence on his life came from his mother.

In his *Autobiography*, Gandhi conveys his early youth as fraught with shyness, academic mediocrity, and betrayal even by his closest friends. He recalls feelings of acute guilt toward his father combined with intense jealousy of his child bride, Kasturbai, as they struggled through an arranged marriage beginning when they were both only thirteen years old. Worst of all were his inner fears: “I was a coward. I used to be haunted by the fear of thieves, ghosts and serpents. I did not dare to stir out of doors at night. Darkness was a terror to me” (Gandhi 1996, 5). Courage and fearlessness became hard sought virtues that he would first acquire as an adult and then embody as a national leader.

Yet his extraordinary journey of the mind took him first to London, where he studied law from 1888 to 1891. Here he developed not resistance to British rule of India, but to the contrary, complete infatuation with everything English. He started at age nineteen in London by entering awkwardly into English society, determined to “be clumsy no more, but to try to become polished” (Gandhi 1996, 7). Twenty years later, he would reject emphatically this early obsessive emulation of English values, but in his twenties, as a prosperous lawyer, his career flourished at first by imitating and practicing what he had learned in England.

In 1893, London law degree in hand, Gandhi went to South Africa to pursue a legal career by representing members of the Indian community there. No

one then could have predicted that he would spend twenty-one years in South Africa, much less the extent to which that long experience would transform his whole life.

The first big change came from his disillusionment with the British rule there, whose empire then included South Africa. Gandhi had encountered racist abuse from the first days of his arrival in Durban, where he was assaulted on a train by offending the iron laws of apartheid. His emulation of the British, though, went very deep, and for years he excused such abuses as unrepresentative of the real spirit of British civilization, which he characterized as intrinsically just and fair. As late as 1905, after having practiced law in South Africa for twelve years, Gandhi urged his Indian community, “We should not envy Britain, but emulate its example” (Gandhi 1996, 8). By 1909, at age forty, a giant leap of consciousness had occurred and with it a dramatic clarion call to resisting British rule: “If India copies England,” he declared, “it is my firm conviction that she will be ruined.”

What explains this drastic about-face? Gandhi’s rebel spirit emerged first in the summer of 1906, with the British response to the Zulu rebellion, an uprising that British soldiers suppressed with shocking brutality. Gandhi entered that summer so loyal to his colonial rulers that he volunteered to serve as a medic with the English troops. He soon discovered that what the British had characterized as a rebellion was really a massacre, often of innocent African civilians. He initially consoled himself by attending to wounded Zulus, but soon his assumptions about English civilization, fixed for decades, completely collapsed. As he was forced to witness the wanton cruelty of the oppressor, rationalized by the uncompromising doctrine of apartheid, Gandhi recoiled in agony against all modes of imperial domination. He had been radicalized by military violence into a detestation of all that it manifested, and soon only a creed of nonviolent action against it would satisfy his spirit.

The Conceptual Relationship Between Power and Freedom

Gandhi's thought is especially distinctive in its subtle conceptual relationship between his theories of nonviolent power and freedom. The idea of freedom he called *swaraj*, a term that he again had derived from an ancient Sanskrit concept that conflated personal and political liberation. An inward sense of psychological or spiritual freedom attained by each person through self-examination became, Gandhi claimed, an absolute prerequisite to the collective political independence that the nationalist movement sought. Freedom as *swaraj*, then, acquired deep philosophical roots.

Swaraj, too, came out of Gandhi's early South African experience, and like *satyagraha*, it was adapted to eventually revolutionize India. These two concepts, *satyagraha* and *swaraj*, the power of nonviolence and a freedom both external and internal, became the twin ideological pillars of Gandhi's Indian nationalist movement. Together they meant that the end of India's independence could be attained only through nonviolent means. Violence would necessarily corrupt the struggle because it violated the central truth of our human connectedness. The movement would teach this lesson through ingenious applications of *satyagraha*, a process that alone could produce *swaraj*.

Gandhi explained that not only is nonviolence ethically superior to violence, but also it can be stronger: unless its force is diluted or contaminated by anger or enmity. "*Satyagraha* is gentle, it never wounds. It must not be the result of anger or malice. It was conceived as a complete substitute for violence." It must probe the inner consciousness of its practitioner to rid the mind and spirit of hatred. *Swaraj*, therefore, had both internal and external aspects. "The outward freedom," Gandhi declared, "that we shall attain will only be in exact proportion to the inward freedom to which we may have grown at a given moment. And if this is the correct view of freedom, our chief energy must be concentrated upon achieving reform from within" (Gandhi 1996, 97–98). Not every political leader will insist that "true freedom" requires "an improvement of the self" and that the oppressed are responsible for liberating not only themselves but also their oppressors in the process of nonviolent action.

Campaigns of Mass Civil Disobedience

Nonviolent action is expressed most clearly, dramatically, and effectively in the form of civil disobedience or noncooperation with an unjust authority. After Gandhi's return to India from South Africa, he gained control of the nationalist movement by 1919 and launched not only the nation's, but also the world's first mass political movement of nonviolent action. Significant elements of the British administration in India were paralyzed, and independence from colonial rule seemed possible. But the mere departure of the British would not, in Gandhi's mind, fulfill the essentials of *swaraj*. *Swaraj* could come only when the Indian people had gained the self-discipline and spirit of humanity that his goal of true freedom demanded. Thus, when a small but fierce outbreak of violence occurred in early 1922, Gandhi stopped the entire national campaign. It would not resume until he believed that his country was ready for a purer form of disciplined civil disobedience.

This second *satyagraha* came in 1930, and for India and the world, it was certainly worth waiting for: a mass drama of nonviolent action entirely unprecedented in history. It became known as the salt march because of its ingenious choice of issue and its leadership style of enactment. Its specific object was to protest against the tax that the British government had placed on salt, which was an enforced official monopoly on the manufacture of salt, restricting its handling to government controlled salt depots and levying a tax on all purchases. Gandhi argued that if the government could tax a basic commodity and necessity like salt, then next there would be a tax on "the water that we drink from our wells or the air that we breathe in our own country" (quoted in Dalton 2012, 101).

He proceeded to defy the salt monopoly and break the law by marching 240 miles to the sea, and there, he simply collected natural salt from the seashore near the village of Dandi on the western coast. Gandhi not only announced this outright defiance beforehand to the press, but also wrote ten days before the salt march would begin a personal letter to Lord Edward Irwin, the Viceroy or chief representative of the Empire in India. These announcements gave the government ample opportunity to arrest him. To the public, there was a fearless quality to Gandhi's openness, announcing with calm and determined forcefulness that he did believe that he had a duty toward the government, the duty to disobey.

Both the government and its subjects soon perceived that Gandhi intended not merely to gather illegally a handful of salt, but rather to summon a tide of mass civil disobedience. This is precisely what he did. On March 12, 1930, Gandhi, age sixty years, left his ashram near the city of Ahmedabad with seventy-eight followers, bound for the shores of Dandi. Gathering thousands of sympathizers along the way, he was watched by news reporters from around the world over the twenty-four days he marched. When he swept into Dandi on April 5th and picked up a few grams of salt early the next morning, his declaration to all nations came loud and clear: “Join me in this struggle of right against might.”

Gandhi’s theory and practice of *satyagraha* were more clearly demonstrated and achieved in the salt march than at any other time in his long career. First, he not only mobilized millions of Indian participants, but also significantly included sympathizers from around the world. For example, he chose a young English Quaker named Reginald Reynolds to hand deliver his historic letter to Lord Irwin, so personifying the inclusion of Britons in the struggle. American supporters were equally present, among them reporters such as Webb Miller, who published compelling graphic accounts of the march in U.S. newspapers. For those who argue, then and now, that only violence is newsworthy, Gandhi proved the contrary, even being named “Man of the Year” by *Time* magazine for “creating history in 1930.”

To his own people above all, he gave the clarion call of “come, march with me.” The vast peasantry, backbone of the movement, heard him beckon them with his consistent emphasis on issues or methods meant to have mass appeal: from the choice of the central issue, the salt tax, a grievance felt especially by the poor; to the means of the march extending twenty-four days, thus giving peasants time to join him as he walked the long distance to the sea; the simplicity of his clothing (homespun cotton cloth called *khadi*) and daily diet, all symbolic of a leader who could be trusted because he was one of them.

Then there were other large groups such as the students who left their schools, flooding into the campaign; yet, there was also the phenomenon of thousands of women, not previously politicized, especially who sought arrest for buying contraband salt that appeared everywhere in markets. By

the end of 1930, over a hundred thousand from all these groups had followed Gandhi to prison, whom the British government, torn by ambivalence in the face of world opinion, finally arrested on May 5.

Gandhi's Fasts Against Religious Violence After Indian Independence

India at last achieved independence from Britain on August 15, 1947, a full twenty-eight years after Gandhi had assumed leadership of the nationalist movement; evidence that when nonviolent struggle against an entrenched authoritarian regime does work, it may require decades of persistence. While India's freedom began a long process of decolonization throughout the world, the subcontinent itself became submerged in mass violence.

As early as 1921, Gandhi had warned, "Let the Hindus and Muslims understand firmly that the cornerstone of *swaraj*, the cornerstone of the freedom of India, is Hindu and Muslim unity" (quoted in Dalton 2012, 139). Yet in the end, his appeals went unheard, and at the time of independence, as religious war consumed his country, Gandhi confessed his failure. He acknowledged the grim truth that Indian culture had at least as much capability for civil violence as any other, that this could occur despite all the emphasis given to nonviolence since 1919, and that although India had gained independence, it certainly had not achieved *swaraj*.

The civil war and consequent partition of British India into the separate states of India and Pakistan was surely the worst period of Gandhi's life. He took partition as a verdict of failure: not that the principle of *satyagraha* had failed, but that he had fallen short in his practice of it. Yet it was then, when this verdict seemed so clear, that he proceeded to demonstrate for one last time the power of his method when tested in the midst of crisis. He reached for what he called his "ultimate weapon in his arsenal," the use of the fast.

The first striking aspect of Gandhi's fasts following independence is that he was now employing *satyagraha* not to combat alien rule, but rather against his own people, to bring them to their senses in the cause of peace. The next feature of his action is that, as an old man shaken to the core, he undertook

to resolve this monumental conflict in areas of violence such as he had never tested his method before. Much of northern India, from small villages to large urban areas, had plunged into civil, or what the Indians called communal, warfare, but no cities were worse than Calcutta and Delhi, and it was there that Gandhi chose to apply his remedy of nonviolence. Finally, even though Gandhi had long since established an international reputation as a renowned champion of peace, many prominent figures in India seriously doubted that his fasts could succeed. *The Statesman*, the leading newspaper of Calcutta, summed up the general skepticism by editorializing that Gandhi's action had no more possibility of bringing peace to the riot-torn city "than of curing a rabid dog of his madness by talking gently" (quoted in Dalton 2012, 150).

Gandhi chose for the site of his fast the home of a Calcutta Muslim friend, a widow who had lost family and property and now lived in a devastated dwelling. The eloquent inclusiveness in his desperate attempt was evident from the time he began his experiment with peace. Attacked by crowds who accused him of taking the cause of Muslims, Gandhi presented himself as a Hindu of Hindus, embodying a religion of tolerance and *ahimsa*. The mob's response was to throw bricks at him, and he very narrowly escaped serious injury. A volunteer squad of Muslim friends and admirers sprang to his rescue, surrounding him from further danger. But it was then, on the evening of September 1, 1947, thirteen months after the civil war had first commenced in Calcutta, twelve days after Indian independence, that Gandhi began his fast.

Gandhi's theory of fasting centered on the premise that it could function as a last resort to elicit the "better angels" in human nature and that the assumption that the "rabid dogs" of war need not prevail. Fasting for a public cause might, even when violence flared everywhere, spark a spirit of civic responsibility, making people pause and reflect, to realize that mutual slaughter was not in their own self-interests.

If ever a fast demonstrated the validity of each of these highly optimistic assumptions, then what historians call "the miracle of Calcutta" serves best. In only 72 hours of fasting, short by standards of many previous fasts, the people of this devastated city responded positively, and the same press that

had rejected Gandhi's methods, now proclaimed the fast an unqualified success. Equally remarkable, he was able to repeat his vindication of nonviolence four months later in Delhi when he again fasted for religious harmony. If there is a judgment of history on the ethics and efficacy of Gandhi's life thought, then the most favorable evidence comes from his use of the march, in his mass civil disobedience campaign of 1930, and of his two fasts for communal unity during the final five months of his life.

Summary of Gandhi's Core Values

Satyagraha was translated literally by Gandhi as truth-force, meaning the power that truth in politics could exercise. This interpretation of truth implied more than acting in a truthful or honest manner. It meant being true to the values of humanity, civility, humility, and nonviolence. When a leader conveys authenticity to a community, it is because he or she acts true to these values. From this action flows a kind of power and trust that can liberate both a self and a system. Freedom in this sense must involve equality because a free society cannot exist if even one person is enslaved. This connectedness resolves the classic problem of freedom versus equality as it does the question of how means relate to ends. When Gandhi wrote in his first treatise titled *Hind Swaraj* ([1909] 1997) that there is an inviolable connection between means and end, that people should never be treated as means but cherished for their sanctity and dignity, he asserted principles that resided at the magnetic center of his thought and experience.

Garibaldi, Giuseppe

The Italian soldier and freedom fighter Giuseppe Garibaldi (1807–82) was born in Nice, France, in 1807 into a family of seafarers. He received little formal education, but was heavily influenced as a young man by Italian patriotic literature and poetry. In 1834, he became involved with Giuseppe Mazzini and his revolutionary organization, Giovane Italia, which had recently been created to work for the unification of Italy, and was sentenced to death for his part in a failed insurrection in Genoa. Forced into exile, he spent more than ten years in South America fighting on behalf of the republican rebels of the Rio Grande and Uruguay and gained an enormous reputation for fearlessness and military skill as commander of the red-shirted Italian Legion. With the outbreak of revolution in Europe in 1848, he returned to Italy and fought alongside the Piedmontese army against the Austrians. In the early summer of 1849, he orchestrated a brilliant defense of the Roman Republic against the besieging forces of the French army.

Garibaldi's achievements in South America and in Italy in 1848 to 1849, together with his romantic lifestyle, simplicity of character, and striking looks (which invited pictorial comparison with conventional images of Christ) gave him an enormous popular appeal, and during the 1850s (much of which he spent traveling in America and Asia before settling down in 1857 on the small island of Caprera off the northern coast of Sardinia), he was regarded by many Italian patriots as critical for winning mass support for the cause of Italian unity. Though his instincts were republican, his relations with Mazzini grew increasingly strained, and when war broke out

in the north of Italy against the Austrians in 1859, he offered his services to Victor Emmanuel II, King of Piedmont-Sardinia. He was given the rank of general and successfully commanded a corps of volunteers.

The abrupt end of the war and the cession by the Piedmontese Prime Minister Count Cavour of Nice to Emperor Napoleon III infuriated Garibaldi. In response to approaches from followers of Mazzini, he agreed to lead an expedition of a thousand volunteers to Sicily in an attempt to seize the initiative from Cavour and complete the unification of Italy. The campaign that he conducted in southern Italy between May and October 1860 was an extraordinary military and political feat and stirred the imagination of liberals and nationalists everywhere. It ended with the intervention of the Piedmontese army (which many saw as an attempt by Cavour to stop Garibaldi and his radical followers from reaching Rome) and the handing over of southern Italy by Garibaldi to Victor Emmanuel II. Italy, with the exception of Rome and Venice, was as a result unified under Piedmontese dominance.

Garibaldi quickly became disenchanted with the new Italian government, sensing that Cavour and his liberal followers had in reality been more interested in extending the power of Piedmont than in creating a truly unified new nation-state. He was especially angered by the way in which many of his followers in the campaign of 1860 were mistrusted by the new government and by the severely repressive policies pursued by Cavour in the south of the country. In April 1861, he entered parliament (an institution for which he had little regard—he preferred benevolent dictatorships), flamboyantly dressed in a South American poncho, and accused the prime minister of waging a civil war.

Garibaldi spent much of the last twenty years of his life away from Italian politics on his island of Caprera. He was increasingly racked by arthritis and general poor health. He made two abortive attempts to capture Rome—the first in 1862, which ended with his followers being fired upon by Italian forces on the slopes of Aspromonte in Calabria and himself receiving a serious bullet wound in the ankle, and the second in 1867, which was halted by French garrison troops. In 1870, he fought for the French Republic against Prussia. An international celebrity (the crowds that greeted him on a

visit to England in 1864 were unprecedented), he lent his name to many left-wing causes in the 1860s and 1870s, including that of international peace. He wrote no theoretical works, but his *Memoirs* (1872) consolidated his image as the quintessential romantic revolutionary. He died in 1882. In the decades after his death, he was extensively celebrated throughout Italy as a symbol of Italian unification and patriotism, and numerous statues and monuments were erected in his memory.

General Will

Coined by French theologians, secularized by French political theorists, and appropriated by revolutionaries and counterrevolutionaries in the French Revolution, the phrase “general will” belongs unmistakably to Jean-Jacques Rousseau. For Rousseau, the general will was the most fundamental of the “principles of political right” referenced in the subtitle to *The Social Contract*, his most systematic work of political theory. Though it is a complex idea, Rousseau’s general will can be summarized as the set of decisions made by a sovereign body, composed of all persons subject to those decisions, with respect to their true interests, which are identical to the interests they hold in common. In other words, it is a true common good that all who understand their own legitimate interests would voluntarily will—thus, Rousseau’s choice of general will, rather than mere general or common good. Confusion about the exact meaning of Rousseau’s general will arises from his varying attributions in *The Social Contract* of sovereignty to the people, the majority, the common good, and even the general will itself.

Rousseau was drawn to the general will as a synthesis of republican virtue and personal liberty. It is a fraught term, presenting many theoretical challenges, but it is also a fertile term, as evinced by the debates it has inspired in democratic theory and practice since Rousseau made it famous.

The term general will originates in the writings of seventeenth-century French theologians such as Blaise Pascal and Nicholas Malebranche. Is

God's will general, they wondered, or does God make decisions on a case-by-case basis? On the one hand, according to St. Paul, God wills that "all men be saved"; on the other hand, according to influential, Jansenist doctrine, salvation depends on grace, conferred on some but not all: "Many are called but few are chosen" (Matthew 22:14). The general will enabled seventeenth-century theologians to distinguish an antecedent general will that everyone be saved from a consequent particular will that only some will be.

In the eighteenth century, French political theorists secularized the general will, transforming it from a divine will into a political one. In this process, much was discarded, but the essential principle was preserved: legitimate power is deployed not on a case-by-case basis but in accordance with general laws. Charles-Louis Montesquieu emphasized the need for a general spirit in republican societies and assigned legislatures the job of expressing the general will of the state. Montesquieu's secularization of the general will applied only to application of laws, not to their formulation. Denis Diderot, a contemporary, colleague, and sometime friend of Rousseau, theorized a general will of humankind, a universal morality or sense of justice, which could govern not only the application but also the formulation of civil law. Unlike Montesquieu's formulation of the general will, which applied to particular societies, Diderot's was a universal will of humankind.

To Diderot's cosmopolitan sense of justice, Rousseau reacted adversely, arguing that it existed only in the minds of philosophers and could neither unite a people nor inspire civic action. Rousseau used the general will to capture his belief that sovereign power is legitimate only when it is based on a shared interest as opposed to an aggregation of particular wills, which he referred to as the will of all. This generality occurs, Rousseau argued, when two conditions are met: first, all citizens must participate in the formulation of the law, and second, they must do so on the basis of the set of interests they hold in common. The general will, therefore, has both a procedural and a substantive component. Not only must citizens participate, but their participation must also be enlightened.

A long history of criticism of Rousseau's general will stems from the possibility that, even under conditions of universal participation, the people could be mistaken about the general will, a point explicitly granted by Rousseau: "There is often a great difference between the will of all and the general will" (quoted in Ritter and Bondanella 1988, "On Social Contract," 100). Rousseau leaves no doubt that the general will is a special kind of common good, not a mere plebiscite: "What makes the will general is not so much the number of voters as the common interest uniting them" (quoted in Ritter and Bondanella 1988, 103). He addresses the possibility of a misguided majority in a way that leaves many critics dissatisfied. Admitting that his preference for direct democracy—with the people making all laws in person—has presupposed "that all the characteristics of the general will are still in the majority," he concludes that when they are not, "whatever side one takes, liberty no longer exists" (quoted in Ritter and Bondanella 1988, 151–52). Although mistakes will happen, he implies, it is better to go with the mistakes of a majority than with those of a minority. Unlike the Americans, or John Stuart Mill (*On Liberty*, 1859), Rousseau never considers the possibility of a Bill of Rights that would protect minorities and individuals from an errant majority.

This lack of legal protections, along with Rousseau's famous dictum that misguided individuals must be "forced to be free," has led critics such as J. L. Talmon ([1952] 1960) to accuse Rousseau of favoring "totalitarian democracy." Talmon and other critics argue that the general will risks being arrogated to an ostensibly enlightened elite, as during the French Revolution, when revolutionaries appealed to the general will to legitimize their harsh rule in the name of the people. Friendlier readers have invoked the general will as a heuristic for thinking about some of the most fundamental problems in political theory. John Rawls and Jürgen Habermas, for example, have drawn on the general will as a model of rational, equitable deliberation. Others, such as Richard Dagger and Philip Pettit, have invoked the general will in describing the importance of republican virtue to democratic politics. For those interested in the conditions for, constraints on, or outcomes of effective public deliberation, the general will continues to be a useful concept.

Genocide

Since the 1994 Rwandan genocide and the more recent murderous events in Darfur, genocide has once again made its appearance on the world stage. The cry of “never again” after the Holocaust apparently fell on deaf ears. Because of the intimate connection between political events and the onset of genocide, political scientists have been increasingly concerned with its explanation.

Earlier Approaches

Initially, however, the preponderance of research in the field of genocide studies had been by professional historians, almost always on a single case of genocide, most frequently the Holocaust. Even the Holocaust, as by far the most extensive genocide of the twentieth century, had received very little attention from historians until the Eichmann trial in Israel and the virtually simultaneous publication of Raul Hilberg’s magisterial study of the Holocaust in the early 1960s. Only then, and with the gradual disappearance of the generation of Nazi perpetrators as well as the even more recent end of the Cold War, did historians, especially German ones, take a serious interest in the Holocaust. The passing of the survivors also has quickened the pace of Holocaust research, before their oral testimony and the writing of their memoirs will no longer be added to the store of evidence.

That literature emphasized explanations ranging from Adolf Hitler's intention to destroy Europe's Jews (the intentionalist approach) to a functionalist argument suggesting that once excluded from Europe's economy by the Nazis, the Jews became an economic burden that needed to be liquidated. More recently, the concept of redemptive anti-Semitism was developed by Saul Friedländer to help understand the Nazi need to kill incessantly and wantonly, even when it served no useful purpose.

Definitions and the Role of Democracy

When examining genocides beyond the Holocaust, the concept required a definition. Building on the sociologist Rafael Lemkin's earlier conception, the United Nations defined genocide as an act "committed with the intent to destroy, in whole or *in part*, a national, ethnical, racial or religious group" (UN Convention on the Prevention and Punishment of the Crime of Genocide; emphasis added). Thus, any systematic slaughter, even if only a small part of a larger ethnoreligious body, constituted genocide. The 1995 mass murder of 8,000 Muslim males in Srebrenica, therefore, qualifies as a case of genocide. A more restrictive definition has been offered by Manus Midlarsky in which genocide is understood to be the state-sponsored systematic mass murder of innocent and helpless men, women, and children denoted by a particular ethnoreligious identity with the purpose of eradicating that group from a given territory. As a consequence, only more thoroughgoing mass murders such as the Holocaust and the eradication of the Armenians from the Ottoman Empire and the Tutsi from Rwanda are treated as genocides. These definitions lead to different research emphases, as is discussed later in this entry.

Among the first efforts at studying genocide beyond the Holocaust by the sociologist Leo Kuper yielded recognition that plural societies are most prone to genocidal activity. The role of political upheaval as a source of genocide, especially in the form of revolution, was then examined by the political scientist, Robert Melson. Both the Holocaust and the Armenian genocide of 1915 to 1916 were preceded by revolutions yielding respectively the Nazi and Young Turk governments.

Interstate war has been recognized as an antecedent of genocide by the sociologist Martin Shaw. And the role of civil war as a facilitator of genocide has been emphasized by the political scientist Matthew Krain. The anthropologist Alexander Hinton's study revealed that Pol Pot's genocidal activity in Cambodia was stimulated in part by both types of warfare. As a consequence of the search for a terrestrial utopia, genocide in four cases is the subject of work by the historian Eric Weitz. Strategic choice and the contingent nature of genocide as an ultimate outcome of societal conflict are emphasized respectively by the political scientists Benjamin Valentino and Scott Straus.

Studies using definitions influenced by that of the United Nations—the less restrictive approach—have yielded findings by the political scientist Barbara Harff, suggesting the role of political upheaval, extraconstitutional change, and civil and interstate war as progenitors of genocide. The importance of democracy as an inhibitor of genocide also emerged from these studies as has the role of immunity from external restraint as a facilitator of genocide.

However, focusing on the most extensive mass murders, yielding 66 to 70 percent death rates, have generated a somewhat different perspective on democracy. While fully realized stable democracy protects the citizens of the democratic state, it can be impervious to the needs of threatened populations in other states. Failures of the democratic governments of the United States, the United Kingdom, Canada, Australia, and New Zealand to permit more than a small number of Jewish refugees and expellees to find refuge in these democracies are salient cases in point. The U.S. immigration quotas for Germany and Austria were never even close to being filled during most of the period leading up to World War II. At the conference on immigration held at Evian-les-Bains in 1938, only the Dominican Republic, a thoroughgoing autocracy under Rafael Trujillo, agreed to accept European Jewish refugees. Without the need to defer to public opinion that might harbor anti-Semitic sentiments as in the Australian case (“As we have no real racial problem, we are not desirous of importing one” [quoted in Wyman 1985, 50]), autocracies could accept Jewish immigrants.

The reluctance of President Bill Clinton to intervene militarily or even support UN intervention in the 1994 Rwandan genocide stemmed from such considerations. Desirous of being reelected in 1996 and having witnessed the negative reaction of the American public to the deaths of American marines in Somalia in 1993, he was strongly averse to another intervention on the African continent. A cynical realpolitik is manifested in which state requirements, as interpreted by the democratic leader, trump the humanitarian needs of noncitizens. Thus, despite the inhibiting effect of democracy, Native Americans were subject to extensive mass killing during the formative period of the United States.

Indeed democratization as a process may be considered as another source of genocidal activity. Revolutionary regimes such as Nazi Germany rose to power as the result of an incomplete democratization in which even the legitimacy of democratic procedures is questioned as in the Weimar Republic. Rwanda, too, was in the process of an incipient democratization, as was the Ottoman Empire prior to their respective genocides.

The Importance of Loss

Loss, especially territorial loss (or the expectation of its imminent occurrence), was found by Midlarsky to be critically important in the onset of the Holocaust and the Armenian and Rwandan genocides. It also was found in the cases of the mass murders of Muslim males in Srebrenica in 1995 and of ethnic Vietnamese in Cambodia during the murderous rampage of the Khmer Rouge during 1975 to 1979. These findings suggest that a focus on the most thoroughgoing genocides can yield explanations of other cases of systematic mass slaughter, whether or not they are defined as genocide.

At least five analytically distinct perspectives inform the consequences of loss. First, as socioeconomic space contracts, the presence of considerable numbers of refugees may lead to an emotional reaction that in turn can result in brutality or even murder. This conclusion is based on recent findings that decisions having moral import are far more likely to be based on emotional reactions than on reasoned deliberation. Identification with the downtrodden because of ethnoreligious commonality may lead to brutal

actions against those, often of a different ethnicity, who are perceived to be at fault in generating the refugee influx.

Additional evidence is found in studies indicating that anger, in contrast to sadness or a neutral emotion, increases the probability of negative reactions to people of a different ethnicity. External threat can stimulate anger, which in turn is most frequently directed against members of a group different from one's own.

Second, the placing of blame for perceived or actual injury to ethnoreligious kin suggests that revenge—a kind of loss compensation—can be exacted. And recent neural findings by Brian Knutson indicate that the experience of actual or anticipated revenge activates regions of the brain associated with feeling good. Thus, revenge can be pleasurable.

Third, if those perceived to be at fault also arrive as refugees or are viewed as comfortable and wealthy, they can be targeted for massacre or ultimately genocide. The intersection of migration, ethnoreligious identity, and social class is combustible. Refugees sharpen an existential contrast with the other; Jews as the anti-German, Armenians as the anti-Turk, or Tutsi as the anti-Hutu, especially if the victims are, on the whole, wealthier and/or more visible than the majority. Competing for the same resources in a shrunken environment, refugees and native populations can come to see each other as inevitable opponents in a contracting socioeconomic space.

Fourth, according to the social psychologists Daniel Kahneman and Amos Tversky, prospect theory also tells us that losses are valued more highly than gains. Experimental evidence has consistently demonstrated the asymmetry between losses and gains, even to the extent that in contrast to gains, losses can generate extreme responses. Losses as the result of a shrinking spatial environment, therefore, may have a magnified role in the public consciousness out of all proportion to the real-world consequences of loss. Again, brutality may be justified in the mind of the observer.

Fifth, the importance of territoriality in its own right should not be minimized, especially if the presence of refugees serves as a continual reminder of the territorial loss. Territory is so fundamental to state security that massive brutalities may be justified in the name of the state. According

to the political scientist John Vasquez, when compared with general foreign policy disputes and those involving contrasting regime types, territorial disputes have a higher probability of escalating to war than either. This tendency suggests the fundamental importance of territoriality, even in comparison with other issues that are typically thought to be critical in fomenting conflict.

A contributing element to the importance of territoriality stems from the signaling of state weakness associated with territorial loss in time of war. Territory can be used to protect the state as in a buffer zone between the state core and its enemies. When that territory is lost, state weakness can be perceived by both defenders of the state and its external opponents. Under certain conditions, that weakness can lead to elimination of internal enemies to buttress the newly vulnerable state.

In each of the cases of genocide discussed in this entry, the socioeconomic space was contracted. By socioeconomic space, I mean the context within which groups live their lives spatially (meaning physical territory), economically, and in their hierarchical relations with each other. This shrinkage, especially if it occurs on all three dimensions, is the single most important long-term progenitor of genocide.

In two of the cases of genocide—Germany and the Ottoman Empire—the empires were contracted as the result of defeats in war. German territorial loss in World War I was not confined to relatively small colonial areas (relative to the British and French holdings), principally in Africa, or former Polish lands in the east. At the time of the armistice, Germany was still occupying large swaths of territory in Belgium and in France, and especially in Russia. By the start of World War I in 1914, the Ottoman Empire had already experienced a contraction beginning in 1774. Economic catastrophe, as in the disasters of post–World War I German inflation, or the extreme indebtedness of the Ottoman state, was an important factor that further magnified that insecurity. In the third case, Rwanda, state insecurity was amplified by ongoing conflict that began with the virtual inception of the modern state, followed by territorial losses to the invading Rwandese Patriotic Front after 1990, and entailed serious economic weakness as well. Further, the recent Hutu political dominance over the Tutsi was threatening

to revert to the earlier, more enduring governance of Hutu by Tutsi. If political subordination exists prior to societal gains that preceded the recent losses, then political extremism and mass violence are more probable.

In addition to these principal cases, there exists variation in genocidal behavior by Germany's allies in World War II. Midlarsky found that while Vichy France, Romania, and Italy experienced territorial losses at some point during the war and thereafter commenced their collaboration with the Nazi genocide of Jews, Bulgaria and Finland gained territory and saved all of their Jewish citizens from the Holocaust.

Genocide of the Vietnamese in Cambodia accelerated rapidly as the Khmer Rouge was being decisively defeated in the quickening border war with Vietnam. So, too, was the genocide of Muslim males at Srebrenica made far more probable by recognition of the impending nearly certain loss of the krajina by Bosnian Serbs such as Ratko Mladi, former commander of the Serb garrison at Knin in the krajina and later the officer in charge of the genocide at Srebrenica.

Genocide Prevention

Lost territory or the threat of its imminent occurrence is an important early warning indicator. The experience of loss and the importance of loss compensation (a form of revenge) in effecting genocide suggest a potential preventive measure. Instead of loss compensation taking the form of genocide, as it has in the three principal cases (and in the instances of Srebrenica and the ethnic Vietnamese in Cambodia, as well as German allies during World War II), it can be introduced much earlier in relations between states or communities, as it was not in the case of Germany after World War I, yielding an important source of Nazi support. Equally to the point, the Sudanese government's fear of the future secession of its southern territories as the result of the 2002 to 2005 Naivasha Accords signaled that crimes against humanity, even genocide as loss compensation, could occur in Darfur, another dissident region of Sudan. International institutions, not limited to criminal tribunals, could identify potential victimizers even before the onset of genocide and engage them in efforts to peacefully compensate them for their past losses or those of the near future.

George, Henry

Henry George was born in Philadelphia on September 2, 1839, and died in New York in October 29, 1897, having spent most of his early life in San Francisco. A chance visit to New York drew his attention to its extremes of wealth and poverty, which did not exist in California. He then set about searching for an explanation.

Back in California in 1869, he witnessed the coming of the railroad, and from this change, he drew the conclusion that the progress of population and industry tended to be absorbed by rising land prices, leaving ordinary people little better off.

That conclusion drew him to the study of the classical economists. The result was *Progress and Poverty* ([1879] 2005). In this book, George rejected the explanations of poverty given by Thomas Malthus, by which the tendency toward over-population always brought wages down to the subsistence level, as well as the wages-fund theory, which assumed that only a fixed sum was available to pay wages at any given point. Instead, to explain poverty in an industrial society, he adopted and developed the Ricardian concept of rent. He argued that if rent continued to be appropriated privately, a growing gap would develop between those who owned valuable land (in which he included resources) and the rest of society. This relative poverty, if unchecked, would in time become absolute poverty in which real wages or the purchasing power of most would decline.

Progress and Poverty also aimed to explain recurring economic depressions (recessions). George argued that, while other causes undoubtedly existed, their initiatory cause was speculation in land, which always followed expanding economic activity. The ever-larger returns to one factor of production, land, was at the expense of labor (in which he included capital as stored labor used to produce more wealth). The resulting discouragement to production manifested first in lagging new construction (in houses and factories). This failure of supply then initiated a failure of demand in a widening vicious cycle. The news of this failure of the economy to expand brought speculation to a sudden halt, leaving many with large interest payments that could not be discharged by the further sale of property. The rapid spread of indebtedness brought a paralysis of credit and severe social disturbance in the form of mounting unemployment, bankruptcies, and foreclosures. The resulting fall in wages, interest, and rents prepared the way for recovery, and the process began all over again.

George's basic philosophic and economic principles, which are set out concisely in Part I, Chapters 4 and 5 of *A Perplexed Philosopher* (1892), are developed from John Locke, Thomas Jefferson, and David Ricardo. Following Locke and Ricardo, George argued that exchange (or market) value came from the input of labor. Land itself, being unproduced, was not wealth and without cost. Rent or land value represented the excess return to the same application of labor and capital due to a superior location. The price of a good was set by its marginal production where production was most difficult. Rent arose on better sites where production (in which George included distribution) was easier. In other words, value lay not in land but in its location or surroundings. Thus, it was a value produced not by the landholder but by the community.

From Jefferson, George drew the concept of natural rights and natural law. The right to use land, he argued, was a natural right, stemming from human need, a right that existed before government. It was a right limited only by the equal right of others, and it was a primary duty of government to guarantee this equal right. In the case of land possessed privately, this equal right could be achieved by a single tax on rent. Rent taken as public revenue would reduce the private value of all land to the same level, to that of marginal or rentless land. Social problems for George came solely from the

denial of the natural rights to “life, liberty, and the pursuit of happiness” and might only be resolved by their restoration.

In the book *Social Problems* ([1883] 1966), George argued that natural monopolies (where competition was impossible) lay properly within the sphere of government. The supply of water, electricity, telecommunications, roads, and public transportation at least cost to the users would enhance the value of adjacent land so that their cost could be recouped from the public collection of rent.

The proposal for the abolition of all forms of taxation in favor of rent collection won George an international reputation, and *Progress and Poverty* sold over two and a half million copies in its first twenty-five years of publication, making it easily the most widely circulating book on economics in history.

Its message was essentially an argument for free trade and an attack on monopoly, especially land (value) monopoly. Markets in labor and capital could only operate optimally if the land market were freed from the private ownership of rent.

In the latter part of *Progress and Poverty*, George prophesied that, if this were not done, progress would revert to barbarism brought about by increasing social inequality.

German Enlightenment

The most important German Enlightenment thinker was undoubtedly Immanuel Kant (1724–1804). In his essay *Beantwortung der Frage: Was ist Aufklärung?* (An Answer to the Question: What Is Enlightenment? 1784), he defined Enlightenment as “the human being’s emergence from his self-incurred minority.” In this sense, Enlightenment aimed at the autonomy of the rational subject—in political terms, at freedom to be understood as the freedom to make public use of one’s reason. Kant’s definition implied not only a philosophical claim, but also an essentially political one, which was realized in human beings’ real liberation from political tutelage and dependence—in historical terms, in the French Revolution or in a comprehensive sense: in the free self-regulation of all political and economic processes.

Natural Law, Reform Absolutism, Political Eudaemonism

Enlightenment as a discourse of political philosophy with the intention of justifying and criticizing social and political realities continued in the tradition of natural law, which at the end of the seventeenth century replaced the Aristotelian-Scholastic triad of ethics, economics, and politics within the academic canon of disciplines. Thanks to the influence of

Christian Thomasius (1655–1728) and Christian Wolff (1679–1754) natural law assumed the leading role in practical philosophy.

Protestant Enlightenment

The contribution of Wolffian scholasticism to Protestant natural law consisted in popularizing and systematizing a jurisprudence based on philosophy and in establishing a conceptually precise terminology. Paradigmatic in this respect was the *Systema elementare universae iurisprudentiae naturalis* (Elementary System of the Universal Natural Jurisprudence, 1749) of Wolff's disciple Daniel Nettelbladt (1719–91), who taught for nearly fifty years at the University of Halle. Aside from pure imitation of his master, Nettelbladt also developed teachings that differed in nuances from those of Wolff, implying concepts of civil freedom, the principle of separation of powers, and even the theory of the right of resistance. This thread was taken up by Gottfried Achenwall (1719–72), who taught at the Göttingen Faculties of Law and Philosophy. In his *Elementa iuris naturae in usum auditorum* (Elements of Natural Law for the Use by His Auditors, 1750), he anticipated Kant's practical imperative as the base of inalienable human rights, and he developed libertarian conceptions of government. The *Elementa*, which appeared in eight editions, were among the most influential handbooks of political philosophy in the second half of the eighteenth century; many natural law teachers relied on this work and even Kant used it for his lectures. Disengagement from Wolff was articulated specifically in Achenwall's empirical politics on the basis of statistical methods, developed in his *Abriß der neuesten Staatswissenschaft* (Compendium of the Newest Political Science, 1749). The most remarkable exponent of Protestant natural law was the Marburg philosopher Hermann Friedrich Kahrel (1719–87). In his *Das Recht der Natur* (The Law of Nature, 1746), he developed a conception of civil liberties and rights and above all, anticipated the essential ideas of Jean-Jacques Rousseau's contractualism, which in his *Völcker-Recht* (Law of Nations, 1750), he applied to the great world government.

Catholic Enlightenment

The Catholic Enlightenment thinkers developed their own conceptions of political philosophy, providing each in their own way answers to the prevailing political challenges. Johann Adam von Ickstatt (1702–71), who had attended Wolff's lectures in Marburg and who became the leading Enlightenment figure in Franconia and Bavaria, introduced Wolffianism into the curricula of the universities of Würzburg and Ingolstadt. In his *Oratio de eurhythmia politica* (Oration on Political Eurhythmic, 1736), he developed a eurhythmic conception of government, the central idea of which was harmony, comprising religious, moral, economic, and legal uniformity. Ickstatt's political thinking was joined to a manifest affection for Protestantism. His *Untersuchung der Frage: Warum ist der Wohlstand der protestantischen Länder so gar viel größer als der catholischen?* (An Examination of the Question: Why is the Wealth of Protestant Countries so Much Greater Compared with the Catholic Ones? 1772) saw the main reason for the prosperity of the Protestant territories in the absence of monasteries: this avoided tying up capital, allowed money to remain in circulation, and resulted in an increase in population and wealth. A similar position was advocated by Karl Anton von Martini (1726–1800), professor of natural law in Vienna, tutor at the imperial court, and statesman, in his *Lehrbegriff des Natur- Staats- und Völkerrechts* (Theory of Natural, National and International Law, 4 vols., 1783–84). He is generally regarded as a theorist of Josephinism—that is, he pleaded for far-reaching rights of regents in religious matters and for the absolute primacy of civil authorities: ecclesiastical property was to be the property of the government, and clergymen were to be the government's subjects. He supported the idea of a civil religion, criticized external constraints in religious matters, and argued for an unrestricted freedom of conscience. One of the most dazzling but also dubious personages of the German Enlightenment was Adam Weishaupt (1748–1830), founder of the Order of Illuminati. Inspired by Wolff's moral and political ideas and by the French Enlightenment thinkers, Weishaupt pursued the goals of morally perfecting humans by means of an educational program and by social and political reforms promoted by the Illuminati through their infiltration of governments.

Reform Absolutism and Empire Patriotism

The advocates of reform absolutism developed programs for preventing a revolution. They agreed with many natural-law thinkers, but unlike those academic theorists, they were statesmen in princely services: Friedrich Carl von Moser (1723–98) was minister of the Landgrave (Count) of Hessen-Darmstadt; the popular philosopher Thomas Abbt (1738–66) gave up his academic career in favor of employment at the Court of Schaumburg-Lippe; and Johann Georg Schlosser (1739–99) realized reform projects as the chief official of a county in southwest Germany.

Moser developed his conception of political reform in his *Ueber Regenten, Regierung und Ministers* (On Regents, Government, and Ministers, 1784). At first sight, his patriotic idea of freedom in his *Von dem deutschen national-Geist* (On German National Spirit, 1765) and in his *Patriotische Briefe* (Patriotic Letters, 1767) seems to disagree with the clear preference he voiced for a monarchy by the grace of God. Monarchy was perceived, however, as a constitutional government whose purpose consisted in the guarantee of freedom. He supported a civil and libertarian constitutional patriotism that also included cosmopolitanism, and he clearly disapproved of any doctrine of racial blood and soil. He differed from Abbt, who in his *Vom Tode für das Vaterland* (On Death for the Fatherland, 1761) advocated an irrational and heroically idealized patriotism along with reverence for the person of the absolute monarch. However, Abbt repudiated this antirepublicanism in his later treatise *Vom Verdienste* (On Merit, 1765) by introducing merit as a moral and political category of republican thinking. Schlosser was in many respects congenial to Moser. The pillars of his idea of civil society, developed for example in his *Vorschlag und Versuch einer Verbesserung des deutschen bürgerlichen Rechts* (Proposal for and Attempt at the Improvement of German Civil Law, 1777) or in his *Briefe über die Gesetzgebung* (Letters on Legislation, 1789), are freedom, human rights, the reign of law, and a hedonistic eudaemonism.

Political Eudaemonism

Eudaemonism was a phenomenon of Enlightenment political philosophy that detached from natural law arguments and found its theoretical grounding in the so-called police science (*Polizeywissenschaft*). Its subject matter was the internal order of the polity, and it comprised the practice of

state administration, social politics, and economics as well as the surveillance of education, morals, and religion. These theoretical systems of police and cameral sciences presupposed an absolutistic government, and they developed comprehensive programs of modernization “from above,” based on a eudaemonistic theory of the purpose of government. They included suggestions for promoting the growth of population and wealth as well as projects of public welfare. In a process of increasing theoretical differentiation, police and cameral sciences became detached from philosophical discourse and turned into special programs of applied social, economic, and financial politics. They concentrated on offering practical advice on agriculture, forestry, mining, and technologies of industrial production in manufactures and factories, while their theoretical substance hardly ever went beyond the basics of business, household, and accountancy. Political philosophy thus degenerated into moralizing cameral instruction, becoming confined to well-meaning admonitions to observe the cameral virtues of probity, loyalty, diligence, orderliness, and cautiousness.

The Berlin Protestant Minister Johann Peter Süßmilch (1708–67), who was influenced by John Graunt (*Natural and Political Observations Made upon the Bills of Mortality*, 1662), William Petty (*Political Arithmetic*, 1690), and William Derham (*Physico-Theology*, 1713), developed a physicotheologically based theory of population that was supposed to serve—together with his empirical method of demographic statistics—as an instrument of welfare politics. His main work was *Die göttliche Ordnung* (The Divine Order). Süßmilch spent much of the period between the first edition of the book (1741 in one volume) and the second one (1765–76 in three volumes) on carrying out thorough research. This research led not only to an enormous increase in the size of the book, but also to a new theoretical orientation: the theodicy of 1741 mutated into a political and economic work based on empirical data of astonishing completeness. Süßmilch maintained a theory of population growth that found a pendant in the theory of state expansion such as it was advanced by the Berlin Police Director Johann Albrecht Philippi (1721–91) in his *Die wahren Mittel zur Vergrößerung eines Staats* (The True Means for the Enlargement of the State, 1753) and *Der Vergrößerte Staat* (The Enlarged State, 1759); both works argued for an absolutistic police and welfare state. The climax of German police sciences is represented by Johann Heinrich Gottlieb von

Justi (1717–71), who ultimately became chief inspector of the Prussian mines and steel industry and by Joseph von Sonnenfels (1733–1817), professor of police and cameral sciences at Vienna—a fruit of his teaching was, among other books, his *Sätze aus der Polizey, Handlungs- und Finanz-Wissenschaft* (Principles of Police, Trade and Finance Science, 3 vols., 1765–76, with eight editions)—and political counselor of Empress Maria Theresa. Justi developed in his numerous writings, for example, in his *Die Grundfeste zu der Macht und Glückseeligkeit der Staaten; oder ausführliche Vorstellung der gesamten Policey-Wissenschaft* (The Groundwork for the Power and Happiness of Countries; or an Ample Presentation of the Entire Police Science, 2 vols., 1760–61), a comprehensive system of political science based on a eudaemonistic theory of the purpose of government. He supported moderately libertarian ideas of government and economics: while the government may continue to superintend the political and financial system, it should allow for the sake of public welfare a far-reaching freedom of trade. Sonnenfels dissociated himself from Justi's eudaemonism and advanced the system of a police government that would guarantee security and an efficient administration; his conception, though sometimes tending to totalitarianism, included a comprehensive program of social politics.

Kant

Dignity of Man, Human Rights, and Civilization

The fundamental notion of Kant's political philosophy, which he developed in his *Grundlegung zur Metaphysik der Sitten* (Groundwork of the Metaphysics of Morals, 1785), his *Kritik der praktischen Vernunft* (Critique of Practical Reason, 1788), and his *Metaphysik der Sitten* (The Metaphysics of Morals, 1797), was his ban on the instrumental use of a human being. This absolute interdiction was derived from the practical imperative: a person must never become an object or a means to an end. A human being is rather an end in itself, the subject of moral law through the autonomy of his will. The basis of human rights is the prejudicial idea of the dignity of humans. In his *Muthmaßlicher Anfang der Menschengeschichte* (Conjectures on the Beginning of Human History, 1786), Kant discussed

the intrinsic contradiction of humankind—that is, the conflict between its genus as animals and its true destination as a moral genus. However, as the civil man always remains a natural one, mankind runs the risk of falling back into barbarism. Nature gave us freedom—natural freedom, but at the same time, nature gave us reason to civilize freedom through autonomous legislation and to secure it on the level of morality. The autonomous act of legislation generated civil law and thus constitutional government as the guarantor of the human right of freedom. The genesis of civil freedom was for Kant a historical process in which human beings rise above the roughness of their natural disposition.

Freedom, Happiness, and Equality

In his *Über den Gemeinspruch: Das mag in der Theorie richtig sein, taugt aber nicht für die Praxis* (On the Common Saying: That May be Correct in Theory, But It Is of No Use in Practice, 1793), Kant criticized Thomas Hobbes's contract of subjection, contrasting it with Rousseau's theory of social contract conceived as a contract of civil union. The purpose of this latter contract is freedom, which is the only true subject matter of human right. This right is a priori; it precedes every empirical purpose so that the happiness everybody is striving for does not belong to the fundamental rights. The contradiction between original freedom and law—to be understood as a limitation of individual freedom so that it agrees with the freedom of all citizens—can be resolved by an argument of reason: reason wishes the social contract. Thus, human rights are principles a priori on which civil society and constitutional government are founded. Kant's essential idea is the a priori nature of human rights; these are not laws enacted by the government but pure principles of reason that may then serve as the basis for constitutional rule. So human rights conceived as the law of reason form the condition of the possibility of constituting civil society as well as—in its function as an authority respected by reason—the condition of the possibility of conserving it and protecting it from relapsing into barbarism and arbitrary rule.

Freedom is the fundamental a priori right of humans. The striving for happiness cannot be brought under an a priori principle in the same way as freedom of the will so that the definition of happiness is left to free

discretion. Nobody can compel me to be happy, but everybody is free to pursue their happiness in any way they desire, as long as they do not infringe on another person's freedom. Kant rejected the view that happiness could be the purpose of government because this would conflict with the fundamental right of freedom. A government prescribing to its subjects how they should be happy would be treating them as minors, a treatment that implied for Kant the worst kind of despotism.

Human beings as subjects are equal under law. Nobody can force another person to any action except by means of public law. Therefore, the principle of equality conceived as an a priori one is not contradicted by factual inequality, for instance, in physical or intellectual abilities or in wealth. The inalienability of equality and of freedom implies that neither equality nor freedom can ever be abolished by contract. Humans can only break away from this legal constitution by criminal, illegal action—that is, they are free to lose their freedom only by abusing it.

Cosmopolitan Law

In his *Zum ewigen Frieden* (Toward Perpetual Peace, 1795), Kant reflected on the universal validity of human rights in a globalized world. In regard to the final aim of perpetual peace, he pleaded for extending human rights into cosmopolitan law. He thus marked the culminating point of a process that started with the pregovernment claims of modern natural law and that led to the universal postgovernment claims of human rights. The idea that peace cannot be realized without human rights is the result of Enlightenment debates on natural law and human rights. The latter form the legitimating base of modern government as a civil and constitutional one and of the maxim of global law and justice.

The Post-Kantian and Post-Revolutionary Era

The French Revolution as well as the revolution of ideas that emerged as a response to the critical philosophy of Kant undoubtedly exerted a strong influence on political thinking and led to a new conception of natural law. This historical break is reflected in the historiographic distinction between

the so-called earlier and later natural law. The earlier natural law was the political theory of absolutism and stood in the tradition of Samuel Pufendorf, Christian Thomasius, and Christian Wolff. It was based on a normatively, theologically, morally, rationally, historically, or empirically based concept of human nature, while the later, Kantian natural law started from legal concepts a priori and presupposed only man's autonomy, thus setting the ground for political libertarianism.

Freedom, Republicanism, Empirical Politics

In his *StatsGelartheit* (Teachings on Government, 2 vols., 1793–1804), August Ludwig Schlözer (1735–1809), professor at Göttingen, established politics as an independent discipline, which in clear opposition to Wolff, he detached from natural law. The latter was to be replaced by a so-called metapolitics that comprised philosophical reflection on the elements of politics as well as arguments for universal human rights, which explicitly included the equality of men and women. Ernst Ferdinand Klein (1744–1810), professor of law at Halle and later the Prussian minister of justice, was strongly influenced by Kant. Klein criticized Wolff's moral foundation of natural law and his political eudaemonism; instead, freedom was to be the starting point of an argument that included a detailed discussion of the relation between freedom and property (*Freyheit und Eigenthum*, Freedom and Property, 1790). Christian Ulrich Detlev Freiherr von Eggers (1758–1813), who was employed by the Danish Crown and who for several years taught politics and economics at Copenhagen, relied in his *Lehrbuch des Natur- und allgemeinen Privatrechts und gemeinen Preussischen Rechts* (Textbook of Natural and General Private Law and Common Prussian Law, 4 vols., 1797) likewise on Wolff and Kant. He downplayed the sharp antagonism between the two notions of the purpose of government as the promotion of happiness or as the promotion of freedom and advanced a theory in which both concepts were conceived—together with enlightenment and perfection—in a mutual and dialectical relationship. He developed his political philosophy within a conception of history as a history of the progress of freedom. Traces of the same Wolff-Kantian eclecticism are to be found in Gottlieb Hufeland (1760–1817), professor in Jena and Würzburg. With his *Versuch über den Grundsatz des Naturrechts* (Essay on the Principle of Natural Law, 1785) and his *Lehrsätze des*

Naturrechts (Theorems of Natural Law, 1790), he was not only one of the earliest, but also one of the most influential law theorists inspired by Kant. The categorical imperative as a formal principle is flanked by Wolff's imperative of perfection as a material principle. Influenced by Kant and Johann Gottlieb Fichte and rejecting the earlier, empirically based natural law, Johann Christian Gottlieb Schaumann (1768–1821), professor of philosophy at Gießen, deduced natural law—starting with the self that posits itself—from pure reason. In his *Wissenschaftliches Naturrecht* (Scientific Natural Law, 1792), his *Versuch über Aufklärung, Freyheit und Gleichheit* (Essay on Enlightenment, Freedom, and Equality, 1793), his *Kritische Abhandlungen zur philosophischen Rechtslehre* (Critical Treatises on the Philosophical Doctrine of Law, 1795), and his *Versuch eines neuen Systems des natürlichen Rechts* (Essay of a New System of Natural Law, 1796), he worked out his arguments for human rights and for republicanism, but he categorically rejected revolution. He was the founder of criminal psychology (*Ideen zu einer Kriminalpsychologie*, Ideas for a Criminal Psychology, 1792); he claimed that women should be judged only by women, and he argued against Kant's support of the death penalty.

This position connected him with the author of best sellers Johann Adam Bergk (1769–1834)—such as Schaumann a Kantian, an opponent of the death penalty, and a proponent of the legal equality of women. In his *Untersuchungen aus dem Natur- Staats- und Völkerrechte* (Examinations of Natural, National, and International Law, 1796) and his *Philopatros: Entwurf zu einer Verfassung für das teutsche Reich* (Philopatros: An Outline of a Constitution for the German Empire, 1796), Bergk argued for an uncompromising republicanism. In a subtle critique of Kant's arguments against the right of resistance (*Briefe über Immanuel Kant's Metaphysische Anfangsgründe der Rechtslehre*, Letters on Immanuel Kant's Metaphysical First Principles of the Doctrine of Law, 1797), he attempted to prove that revolutions were democratically justified.

Conservatism

Conservatism was not only a prerevolutionary, but also a postrevolutionary phenomenon of German Enlightenment political theory. A representative of the former was Justus Möser (1720–94), who as the guardian of the minor

Frederic Duke of York (1763–1827) governed the city-state of Osnabrück for nearly twenty years. He maintained an anti-civil, anti-republican, and anti-libertarian conservatism, the background of which formed the apology of early medieval feudal society. He made the capability of entering into social contract dependent on land property (*Der Bauerhof als eine Aktie betrachtet*, The Farm Considered as Stock, 1774), and he argued for a differentiated hierarchal model of government and society that he illustrated with the metaphor of a pyramid (*Der Staat mit einer Pyramide verglichen*, Society Compared with a Pyramid, 1773). Later, conservatism was distinguished by a strict rejection of the French Revolution—its theoretical foundation, political claims, and historical consequences. Typical of the postrevolutionary conservatism was the Leipzig professor of philosophy Georg Niklaus Brehm (1753–1811), author of *Über den politischen Naturalismus* (On Political Naturalism, 1793) and *Über die natürliche Gleichheit der Menschen* (On the Natural Equality of Men, 1794). On the level of the revolutionary arguments for human and civil rights, Brehm pointed out the antagonism between the claims for equality and for freedom. His critique of a naturalistically distorted egalitarianism argued from the standpoint of the normative authority of positive law. Revolution would lead to the dissolution of the natural and reasonable order, to chaos and anarchy, to a relapse into a prelegal state of the war of all against all.

Political Economy

Eighteenth-century political economy had its theoretical roots in early modern natural law: the subject matters of self-conservation and freedom were economically specified. The absolutistic phenomenon of political eudaemonism obviously disagreed with natural-law claims for freedom: in practice, it amounted to a governmental technique for making its subjects happy by means of extensive authoritarian welfare politics that kept the people on a leash, and it included far-reaching interventions in social and economic processes. These practices were countered by libertarian political economics. However, although Adam Smith's *Wealth of Nations* was immediately translated by Johann Friedrich Schiller (*Untersuchung der Natur und Ursachen von Nationalreichthümern*, I-II, 1776–77) and later by Christian Garve (*Untersuchung über die Natur und die Ursachen des Nationalreichthums*, I-II, 1794–96), libertarian notions could not easily

prevail against the predominant police and cameral conceptions such as those advanced by Justi or Sonnenfels. The lane on which Smith would invade Germany had been undoubtedly paved by Kant—the affinity between moral autonomy and libertarian economics is evident.

One of the earliest German readers of Smith was Johann Friedrich von Pfeiffer (1718–87), who can also be considered as one of his forerunners. Pfeiffer was a high Prussian official who later failed as an entrepreneur of coke production and starch fabrication before being appointed professor of cameral sciences at Mainz. Notwithstanding Pfeiffer’s obvious sympathy for Smith, his economic thinking was also marked by a receptiveness toward theories advocating a planned economy in the sense of an absolutistic eudaemonism (*Grundsätze der Universal-Cameral-Wissenschaft*, Principles of the Universal Cameral Science, 1783). A precursor to economic libertarianism was physiocracy—in Germany propounded by Johann August Schlettwein (1731–1802), who was involved in political and economic reforms in southwestern Germany before becoming professor at the newly founded Faculty of Economics at Gießen. His major works were *Die wichtigste Angelegenheit für das ganze Publicum: oder die natürliche Ordnung in der Politik* (The Most Important Matter for the Whole Public: or the Natural Order in Politics, 2 vols., 1772–73) and *Grundfeste der Staaten oder die politische Oekonomie* (Groundwork of the States or Political Economy, 1779). The best known German followers of Smith were—besides August Ferdinand Lueder (1760–1819), professor in Brunswick and Göttingen and author of *Ueber Nationalindustrie und Staatswirthschaft* (On National Industry and Public Economics, 3 vols., 1800–04)—Georg Sartorius (1765–1828) in Göttingen and Christian Jakob Kraus (1753–1807) in Königsberg, who both adhered to Smith very closely, as well as the above mentioned Kantian Gottlieb Hufeland. The affinity between Smith and Kant is manifest in the transcendental economics of the Heidelberg professor Johann Adam Völlingers (1756–99). He developed an economics that claimed to be a priori and that was conceived as a “daughter science” of Kant’s critical philosophy. In his *Grundriß einer Allgemeinen kritisch-philosophischen Wirtschafts-Lehre* (Outline of a General Critical Philosophical Doctrine of Economics, 1796), he started with the question how economics as a science was possible and then deduced the concept of economy from need.

Christian Daniel Voß (1761–1821), who taught at Halle, was also influenced both by Kant's philosophy and by Smith's economics. In his *Handbuch der allgemeinen Staatswissenschaft* (Handbook of the General Political Science, 6 vols., 1796–1802), which comprised more than 3,000 pages, he embedded economics in a comprehensive system of political philosophy. His libertarian conception advocated a system of free trade and industry based on the notion of a restless human mind striving constantly for advancement and progress. The main requirements for economic growth and increase of national wealth were the free exercise of one's will and the free development of productive powers. Governmental compulsion, artificial steering, and supporting measures would hinder economic development.

German Political Thought

This entry is an attempt to elucidate the main lineages of post-1789 political reflection in Germany by identifying influential theories in terms of their position within a left-right spectrum of political opinion. It aims to account for the dominant patterns of political argument that broadly characterize German liberalism, German conservatism, and German radicalism.

German Liberalism

At the origins of the development of liberal thought in Germany stands the practical philosophy of Immanuel Kant. Kant's mature political thought was formulated as a response to the revolutionary transformation of France between 1789 and 1795. It endorsed the basic constructs of political legitimacy that influenced the French Revolution, and it reflected in a cautiously affirmative manner on the achievements of the revolution itself. Proceeding from a rationalistically distilled variant on Jean-Jacques Rousseau's theory of the general will, on one hand, Kant argued that a state becomes legitimate if it is separated from all patrimonial authority, if its laws are applied without variation of status through society, and if it enshrines laws that can be recognized by rationally reflexive subjects as preconditions for the exercise of freedoms appreciable equally by all members of society. Deviating somewhat from Rousseau's skeptical attitude to antecedent rights and pure theories of natural law, however, Kant also claimed that legitimate statehood is defined by the fact that the state

recognizes all those subject to its power as bearers of inviolable rights, such that freedoms protected by a legitimate state are anterior to, and they subject to prior constraint, any institution utilizing politically coercive force. Kant's liberalism thus approved certain principles of the radical republicanism generated in revolutionary France. However, his doctrine of legitimacy remained closer to the liberal monarchism of 1791 than to the Jacobin republicanism of 1793 to 1794, and it provided a model for government under the rule of law in a rights-based constitutional monarchy. Vital to Kant's thinking was the claim that in a legitimate political system, the law originates exclusively in the exercise of autonomy by pure rational beings, separated from historical and cultural context and elevated above material and sensory experience. For Kant, the law of the legitimate state is the law in which autonomous rational agents project a condition of ideal liberty, whose founding principles can be universalized across all historical and geographical locations. Underlying the legitimate state is thus, for Kant, the pure personality of the rationally free and autonomous human agent.

Like the French Revolution itself, Kantian liberalism became a touchstone for the formation of ideological movements throughout the nineteenth century. Subsequent ideological positions—liberal, conservative, and radical—tended to organize their arguments in critical response to the perceived antinomies of Kantian thought, and in particular, the apparent historical and experiential vacuity of Kantian ideals of autonomy became a focus of critique across the political spectrum. In the liberal canon, to be sure, Kantian ideas retained influence throughout the nineteenth century. For example, the major popular liberal theorists of the national-revolutionary era leading up to 1848, Karl von Rotteck and Karl Theodor Welcker, reinvigorated Kantian principles of rights-based legitimacy. Toward 1900, the Marburg school, centered around Paul Natorp and Hermann Cohen, promoted an influential fusion of ethical socialism and progressive liberalism, based in a reconstruction of Kantian thought as a doctrine of moral community. After 1945, Kantian thought witnessed a dramatic and still enduring resurgence. This resurgence was visible first in the existentially inflected Kantian ethics set out by Karl Jaspers, and it persisted in the works of Jürgen Habermas. Habermas's early writings combined republicanism and Marxism, but his work acquired greatest impact through its reconfiguration of Kantian universalism to define rights-

based communicative consensus as the prerequisite for legitimate government. Even in the liberal canon, however, post-Kantian German political theory evolved, not primarily as an affirmative reception, but as a rejection of Kantian liberal ideas in their pure form.

The liberal reaction against Kant became evident, first, in the works of Georg Wilhelm Friedrich Hegel. Standing at the conservative perimeter of liberal reflection, Hegel argued that the achievements of the revolutionary era—personal rights, limited parliamentary representation, abolition of patrimonial authority, rational legal order, formal economic autonomy—needed to be separated from pure rational individualism, and they had to be comprehended as produced forms by society, reliant for their stable realization on complexly embedded relations of recognition, objective order, and enlightened education.

Slightly later, the consolidation of liberal theory through critical engagement with Kant was also a feature of the rise of positivism, in many respects the defining and most distinctive strand of German liberal thought. Positivism was initially promoted in the nineteenth century, in particular by Georg Friedrich Puchta, Rudolf Jhering, Karl von Gerber, and Paul Laband, as a body of cautiously reformist legal and political theory. On one hand, positivism revolved around the claim that all legitimate order is subject to legal constraint. On the other hand, however, it argued that the legal limits of public authority arise, not from any ethical presumptions in the Kantian sense, but from the general, uniform, and positive order of law itself, whose origins reside in the sovereign power of the state, and which is closed against externalistic ethical or utilitarian considerations. Distinctively, positivism viewed the concepts of Roman private law, especially the Roman concept of legal personality, as the most adequate terms for expressing the conditions in which political coercion could be legitimately enforced. Positivism was in fact often characterized as Romanism. To a greater extent even than Kantianism, in consequence, early positivism expressed a cautious, formalistic theory of legal order, and it provided a model for a constitutional monarchy in which monarchical power was subject to clear yet weak counterweights. After 1900, however, positivism moved more decisively in the direction of republican constitutionalism. This move was expressed in the writings of Hans Kelsen, who helped to write the Austrian

Constitution of 1920. Close to liberal socialist ideals, Kelsen followed the general positivist impulse in asserting that law needed to be viewed as fully separate from moral imperatives. Yet he argued that public-legal norms formed an incontrovertible constitutional framework for state power and that power and law could not legitimately be applied as distinct resources. Dualistic constructions of state authority—that is, ideas of authority separating state power from the law—were derided by Kelsen as corruptly metaphysical representations of statehood.

The most far-reaching critique of Kant within the liberal movement can be identified on the historicist wing of German liberalism. Liberal historicism can itself be divided into two rather distinct groups. On one hand, the period connecting the failed constitutional revolutions of 1848 and the consolidation of Bismarck's imperial state after 1870 to 1871 witnessed a rise in the influence of organic liberalism or Germanism. This tendency became manifest, first, in the works of Otto von Gierke and second, in the writings and political interventions of Hugo Preuß, who played a significant role in writing first democratic German Constitution in 1919. Organic liberalism argued that German history provided the foundation for a specifically Germanic construction of government founded in associational life, and it stressed that legitimate statehood should be construed, in quasi-sociological terms, as an organic order, formed and legitimized through the active integration and reconciliation of the plural associations existing in civil society. Central to the liberalism of the Germanist school were a rejection of positivistic, Roman-legal constructions of the state as a volitional order detached from society more widely, and accordingly, an insistence that, as a center of pluralistic integration intersecting deeply with social organizations, the state was obliged to allocate rights to social agents both as bearers of singular-private rights and of collective-material or associational rights. In this respect, organic theory promoted social-liberal perspectives, and it at times coalesced with social-democratic ideals. Both Gierke and Preuß were critical of the classical liberal acceptance of capitalist private law as a formal constraint on public or constitutional law.

At the same time, German liberalism also promoted a more clearly nationalist school of historicist theory, which centered on a strict rejection of Kant's rational purism. This line of theory argued against static notions

of legitimacy derived from the natural legalism of the Enlightenment, and it was based in the broad sense that the conditions for the exercise of legitimate public power were ingrained in the conventions of national culture. Such assumptions were perfectly commensurable with liberal standpoints. This alignment is clear in the case of Johann Gustav Droysen, a strong supporter of national constitutionalism in 1848, and Wilhelm Dilthey, who viewed the interpretation of national culture as a source of personal freedom and self-enrichment. However, such historicism assumed its defining political expression in the national-liberal movement of imperial Germany, exemplified by Heinrich von Treitschke. Treitschke asserted that national freedom and personal freedom are closely connected, and he observed the powerful national state as a personality able legitimately to incorporate the freedoms of, and so demand obedience from, all members of national society. A final echo of national historicism is discernable in the writings of Max Weber, the most notable liberal theorist of the later Imperial era. Weber's political work was founded in the assumption that human freedoms are underpinned by visceral experiences of national affiliation, and he defined a legitimate state as an institution able to integrate the pluralistically divided sectors of mass society by appealing to social agents as constituent parts of a national collective. On this basis, Weber proposed a two-sided theory of the late liberal state. He argued that the state is legitimized, externally, by its pursuit of national economic prerogatives, and it is legitimized, internally, by its ability to integrate different social groups through the affectual appeals of elite politicians and through the partitioning of national goods for the sake of national integration and equilibrium.

German Conservatism

As in other European countries, early German conservatism was originally defined by opposition to the rationalistic objectives of the Kantian Enlightenment and the French Revolution. In the first instance, German conservatism was marked by a spirit of nostalgic romanticism, which looked back to estate-based premodern society in which religion, local power, and the authority of the Holy Roman Empire formed the bedrock of social order. The more overtly reactionary examples of early German conservatism, exemplified after 1815 by Friedrich Wilhelm Joseph von

Schelling and Friedrich Julius Stahl, moved close to classical theorists of the restoration such as Joseph de Maistre and contended that legitimate authority could only be based in religion. More moderate lines of conservatism, exemplified by Karl Friedrich von Savigny, tended to reflect Burkeian ideals, and while rejecting rationalistic constitutional ideals, they were prepared to accept sociopolitical transformation if it occurred as an organic or gradualistic process. In these respects, different lines of early German conservatism paralleled typical patterns of conservative thinking in other post-1789 European societies.

More distinctive patterns of conservatism began to evolve in Germany through the course of the nineteenth century. In many cases, German conservatism was defined by its renunciation of classical conservative interests such as religious piety, inherited status, and local authority, and it began instead to galvanize more typically liberal outlooks into identifiably reactionary form. In fact, it was a characteristic of German conservatism in the later nineteenth and earlier twentieth centuries that rightist perspectives, culminating in the ideological stances broadly linked to National Socialism (the German variant on European fascism), were elaborated on the foundation of originally liberal doctrines.

As illustration, first, by the later nineteenth-century Hegel's conservative liberalism had been subject to highly reactionary reinterpretation, and the historicist aspects of Hegelian thinking had been transformed into a doctrine of culturally embedded authoritarianism. This transformation continued into the Weimar Republic, during which time a line of extremely reactionary post-Hegelian idealism became influential. Similarly, by the 1920s positivism had hardened into a set of deeply antiliberal stances. This reactionary intensification of positivism gained clearest expression in the thought of Carl Schmitt. At one level, Schmitt perceived himself as an antipositivist: he was full of invective for the liberal positivism of Kelsen, which he saw as an empty ideological formalism, threatening to destroy the power of the state by conflating state power with neutral legal norms. At times, Schmitt ridiculed the basic positivist idea that the law could be observed as an internally closed system of norms: he squarely opposed positivism by claiming that law needed to be explained sociologically and that public law only assumed value as the expression of the will of a

historically unified people. On this basis, Schmitt proposed a theory of political dictatorship, which argued that the constituent will of the people transmitted through the institutions of state should be viewed as higher-order law, which under some circumstances could be better defended by a commissar or dictator than by an elected parliament, defined by a formal constitutional order. Nonetheless, Schmitt remained close to positivism in that he defined state legitimacy, in Hobbesian categories, as the expression of political volition, he claimed that all law has its foundation in positive acts of state, and he concluded that the law formed by the will of the state forms a coercive order that cannot be challenged by extralegal or normative principles. After 1933, Schmitt concluded that national law should be perceived as an unquestionably valid concrete order, and he proposed a doctrine of political authority that fused positivist principles with a technocratic conception of state power as a function of positive administrative steering. This reactionary positivist aspect of Schmitt's thought became foundational for post-1945 conservative thinking, and it was assimilated in the works of Ernst Forsthoff, Arnold Gehlen, and to some degree, Niklas Luhmann.

By the 1920s, likewise, liberal historicist thinking was largely aligned to reactionary attitudes, and opponents of the democratic experiment in the Weimar Republic typically argued that parliamentarism was irreconcilable with the political customs arising from German historical life. In many cases, conservative historicism was linked to the Lutheran milieu, which identified German national culture as secularized Lutheranism, intrinsically sympathetic to authoritarianism and hostile to democratic aspirations. The most prominent example of ultrareactionary historicism is the political philosophy of Martin Heidegger, who examined national history as the horizon of all human life and self-interpretation. In a radical historicist response to neo-Kantianism, Heidegger claimed that obedience to directives arising from national culture (i.e., ordained by the state) should be acknowledged and resolutely accepted as shared fate by all members of a national collective. Analogously, by the 1930s, organic theory was also appropriated by reactionary movements. Although less susceptible than positivism or historicism to reactionary misconstruction, organic theory, especially in its hostility to formal statism and its insistence on the complex linkage between state and society, became the basis for the national

corporatism that underpinned economic outlooks in both Germany and Austria in the earlier part of the 1930s. Othmar Spann can be cited as the most striking example of this outlook.

Across the spectrum of reactionary thinking, in short, modern German conservatism evolved in a terrain that had been cleared by liberal thinkers. National Socialism itself was an ultrareactionary ideology that turned against the principles of classical conservatism and manufactured its outlooks through a selective absorption of liberal and to a lesser degree, Marxist concepts. Numerous historical reasons can be cited to explain the close relation between liberalism and extreme conservatism in Germany. One reason for this similarity was simply that the unified German state was formed in 1870, after the age of high liberalism had passed: as a result, liberalism never emerged as a persuasive response to pressing societal exigencies in the united Germany, and it lacked the overarching integrative force possessed by liberalism in Britain, France, or the United States. A further reason was that the unified German state was formed at a time when, across Europe, liberalism was deeply (and usually sympathetically) shaped by the experience of imperialism so that liberal reformism and enthusiasm for national strength and expansion were often inseparable. One additional reason was that, whereas in most European countries the construction of a central state was the accomplishment of liberals or even of revolutionaries, in Germany the state-making endeavors of liberals (culminating in 1848) were a failure, and the unified state under Bismarck, although not without some liberal conventions, possessed a strongly authoritarian character. Of greatest importance in this respect, however, is the fact that in Germany liberalism was not firmly established as an ideology when Marxism began to figure as a powerful mobilizing force; this lack meant that the ability of liberalism to integrate sectors of the moderate left, so typical of British liberalism, was limited, and liberalism tended to gravitate to the right and to legitimize itself through appeals to social groups alarmed by the rise of Marxism and the trade-union movement. Of course, the convergence of liberal and reactionary views was not exclusive to Germany. This can in fact be observed in most European societies. Nonetheless, it remains striking that in Germany liberalism lacked an encompassing appeal, it could easily be discredited, and it offered conceptual foundations for highly reactionary attitudes.

The most striking example of this phenomenon is again provided by Weber. Although by affiliation liberal, Weber's political thought was centered in the claim that Marx's account of modern society as defined by class conflict over socioeconomic goods had to be supplanted by an account of modern society as defined by political conflict over national interests: he extracted a theory of social conflict from Marxism, and he inserted this concept into a doctrine of national antagonism in which nation superseded class as the primary source of collective political motivation. In this respect, Weber's political sociology reflected a wider tendency to combine conflict theory and nationalism, which became widespread in the course of World War I and eventually assumed central status in fascist ideology. Weber, we can speculate, would doubtless have been implacably hostile to the fascist regime that eventually emerged in Germany. However, his work shows quite strikingly how liberalism contributed to the ideological basis of German conservatism, and it illuminates the ideological predicaments faced by German liberalism, which was forced to solidify a liberal-democratic creed at a point when the tenets of liberalism had lost their motivational force. Tellingly, Schmitt himself classified the most extreme example of German conservatism—National Socialism—as authoritarian liberalism.

German Radicalism

Modern German political radicalism had its origins in the anthropological materialism of Ludwig Feuerbach. Proceeding from a humanistic reconstruction of Hegelian philosophy, Feuerbach argued that human life suffers from intense alienation as a result of Christian belief, which in projecting human essence (species-being) onto the deity, subordinates humanity to a falsely externalized image of its own innermost attributes and estranges it from its intrinsic capacities for shared freedom and sensory enjoyment. The concept of alienation was already implicit in Hegel's phenomenological account of social polarization. Yet it was Feuerbach who placed this concept at the center of a theory of human society and historical experience. Subsequently, Marx developed his early theory as a microanalysis of alienation, which redefined alienation, not as the consequence of religious projection, but as the result of material exploitation under conditions of early capitalism. After Marx, the discovery of alienation impacted across all lines of political thinking, and deep

concern with this concept connected Marxism, Weberian liberalism, Schmitt's theory of dictatorship, and Heidegger's fascist historicism.

In the wake of Marx's writings, German radicalism first produced a distinct orthodoxy in the course of the revisionist controversy, which defined debate in the Social Democratic Party (SPD) before 1900. Owing to the rise of the SPD as a powerful and highly organized movement in the 1890s, German socialist theory, expressed in particular by Eduard Bernstein, began to veer away from its revolutionary beginnings, and it proposed a revisionist doctrine of working-class organization, which stressed the importance of parliamentary democracy, centralized state authority, and regular political representation as essential to the successful amelioration of conditions of labor. Although contested within the SPD, by 1914 the revisionist stance became effective orthodoxy for the German labor movement. This position absorbed important impulses from Austro-Marxism in the works of Karl Renner, Rudolf Hilferding, and Otto Bauer, who argued, diversely, that cross-class collaboration, concentration of economic authority in the national state, and progressive revision of private-legal relations were vital devices for establishing a socialist economy. The Weimar Republic itself was in fact initially an experiment in an early system of welfare democracy in which state control of select industrial sectors and workers' codetermination of employment relations were accorded constitutional standing.

Ultimately, however, German radical theory assumed its greatest influence by establishing a framework in which Marxist analysis could be reincorporated into philosophical discourse. In so doing, it provided enduring foundations for the different tendencies within what became known as Western Marxism more broadly. This redirection of Marxist inquiry resulted in part from a reappropriation of the concept of alienation originally elaborated by Marx, and moreover, it drew impetus from a deep critical engagement with Kantian philosophy.

First, in the early 1920s, György Lukács proposed an analysis of capitalist society that argued that capitalism needed to be comprehended, not solely as a material-economic reality, but as a cognitive-epistemological condition, shaped by a total (i.e., material, cognitive, and historical) experience of

human alienation. The overthrow of capitalism presupposed, for Lukács, a reconfiguration of human rationality itself: it could only occur if human rationality divested itself of its Kantian self-constructions, which Lukács characterized as bourgeois reason, and if it recognized itself as historically mediated through the socially constructed reality of exchange relations. Such material-historical self-analysis of reason, Lukács claimed, would provide the epistemological basis for a revolutionary transformation of the historical conditions that had caused the alienation of human consciousness. Together with the almost simultaneous writings of Antonio Gramsci, Lukács's account of capitalism established the premise for the subsequent orientation of Western Marxism away from traditional questions of party organization toward analysis of capitalism as a hegemonic cultural condition.

Under the pervasive influence of Lukács, then, during the 1930s and in particular, after 1945, German Marxism intensified its cultural-epistemological emphasis. This emphasis was expressed especially in the Critical Theory of the Frankfurt school, which combined Marxist political economy, Lukácsian theories of rationality, and quasi-existential analysis of cultural alienation. Expressed primarily in the works of Theodor Adorno and Max Horkheimer, the Frankfurt school argued that modern capitalism needed to be appreciated as a condition of extreme and dehumanizing alienation in which the instrumental or taxonomic dimensions of human reason (in its Kantian self-construction) had eradicated capacities for nonoppressive recognition, natural experience, and sensory gratification, which were also intrinsic to human life. This argument resulted in a theory of the dialectic of Enlightenment, which examined the modern economy and the modern state as distillations of the violently instrumental emphases of rational subjectivity. It was closely shaped by an account of National Socialism, and in particular of the regimented genocide that occurred in the German concentration camps, as intensified reflections of the intrinsically violating potentials of the models of reason promoted in the Enlightenment.

Although it played a fundamental role in shaping the political culture of the 1960s, in its first generation, the Frankfurt school scarcely produced a coherent body of political theory. However, some ideas resulting from the Frankfurt school were transformed into a more coherent political doctrine

by Habermas. Habermas tied the theory of alienation to a concept of communicative rationality, which claimed that undistorted communication between free participants in rational discourse might establish general conditions for nonalienated (and thus legitimate) political existence. Indeed, Habermas's thought assumed the distinction in the broader context of German political thought that it assimilated classically anti-Kantian impulses such as concern with historicity, singular existential experience, and material alienation into a basically Kantian insistence on legal universalism as the foundation of legitimacy. In this respect, Habermas's work can be seen as drawing together the antinomies of German theoretical reflection first engendered through the anti-Kantian trajectory of German liberal theory, and it proposes a rescue of the Kantian Enlightenment through a doctrine of communicative interaction and lived solidarity.

Global Civil Society

The concept of global civil society first came to prominence in the 1990s in response to the increasingly deterritorialized nature of political activism after the end of the Cold War. Users of the concept sought to capture the upsurge of transnational civic—as opposed to state—activity from human rights activism to global popular movements against state actors (e.g., the battle in Seattle protests during the 1999 World Trade Organization ministerial conference). The mood reflected by the concept was one of global popular agency—of a revolution from below to counter the deleterious effects of a neoliberal form of economic globalization that had been imposed from above. Global civil society, on this reading, was the driver of a fundamental shift from the politics of states to the politics of peoples—that is, from the politics of narrow state self-interest to the politics of global shared values and from the politics of state sovereignty and nonintervention, behind which tyrants hid, to the politics of human rights.

Global civil society projected globally a longstanding concept—civil society. The citizen self-organization referred to by this latter concept, traditionally held to be a counterweight to state power in liberal societies, also seemed central to the third wave of democratizations that toppled authoritarian states around the world in the 1980s and 1990s. Civil society actors from Manila to Prague were seen as having more in common with each other (commitment to human rights and democracy) than with their own states. It seemed a logical step to include in the concept of civil society recognition of the fact that activists were increasingly no respecters of

borders, agitating for the rights of citizens in countries other than their own. Where Cold War realists had seen little if any role for actors other than states in the international arena, the 1990s seemed to inaugurate a poststatist and postnational form of politics in which civic, rather than state actors and values, rather than interests, had begun to predominate.

Thus, global civil society is at once a normative and descriptive concept. Descriptively, it focuses on transnational civic activism, on citizens without borders. Normatively, it emphasizes the role of such activism in undermining what is seen to be the largely self-serving and amoral behavior of states in the international system. Global civil society holds out the hope of a world order defined less by self-interested states operating under conditions of anarchy and more by a rule-based international system in which states are increasingly constrained by human rights and democratic norms. In this sense, global civil society has been seen as the agent of the domestication of the international and as such, as an answer to war.

Critics of the concept of global civil society have pointed to the questionable democratic credentials of transnational civic actors, who can neither claim to represent, nor to be accountable to, fixed constituencies in the way of territorialized political actors. On this critique, transnational activism is an expression, ironically, more of the atomization of political struggle than its reformation at the global level. Easy identification with global good causes is held to be a poor substitute for the political engagement characteristic of territorialized politics, which forces political actors either to convince others or to compromise. It has also been argued that transnational actors are just as likely to be noncivic (international terrorism, the mafia, etc.), such that it sometimes seems like definitional fiat to include only groups that conform to the liberal values alluded to by the concept.

Neo-Foucauldians have also suggested that global civil society actors, especially international nongovernmental organizations, are central to the spread of biopolitical forms of control in which populations are seen as in need of, and amenable to, interventions designed to secure the needs of life itself. From this perspective, global civil society, reflecting Michel Foucault's earlier account of civil society in liberal states, is the product of,

rather than the cause of, liberal governance. In an attempted update of Foucault's thesis, liberal governance is read as a global phenomenon, with the associated shift from civil to global civil society that accompanies this extension of liberal governmentality. Thus, a concept associated with unambiguously positive change in the 1990s is now taken to be more ideological than it had first seemed.

Globalization

Globalization is the increasing integration of the world and greater interconnection of various states and societies. It covers a number of different fields—including culture, politics, and economics—and is best understood as a development stemming from the metaphorical compression of distance in the world as a result of technological advances. In other words, innovations such as ships, the telegraph, and aircraft have allowed information, people, and commodities to move from place to place increasingly more quickly. The economic ramifications of globalization have been especially accentuated in discussions of the process.

As a term, *globalization* is more often than not effectively used as a synonym for other processes, such as the pursuit of free-market policies across the world or for Westernization (i.e., the increase of the dominance of Western, and especially American, values in political, economic, and cultural life across the globe). The conflation of globalization with other phenomena is undesirable insofar as it strips the term of its own distinct meaning. Nevertheless, there is considerable overlap between globalization and other modern trends in world politics and international relations. In particular, it has become bound up with the development of capitalism, especially from the post-1945 period onward, and there is debate as to whether globalization is a discrete stage in the history of capitalism or if it instead belongs to a longer-term process. Therefore, satisfactorily establishing the meaning and relevance of globalization requires the use of a historical approach.

History of Globalization

Andre Gunder Frank, among others, contends that globalization should be traced back to the ancient world and the earliest emergence of cities connected to trading networks. Frank argues that history has been characterized by a single, evolving, world system and that the division of history into stages of feudalism, capitalism, and so on is a fallacy. This view has, however, been criticized on a number of grounds, most notably by Immanuel Wallerstein, who instead posits that capitalism is a modern and distinctive mode of production and that any concept of a world system can only be dated back to the sixteenth century when capital accumulation began to promote commercial development. Janet Abu-Lughod has revised Wallerstein's argument by advancing the idea that a premodern world system, centered on Eurasia and consolidated by the Mongol Empire, existed in the thirteenth century and that its collapse precipitated the rise of the European system. Thus, Abu-Lughod's theory complements rather than replaces Wallerstein's, while the latter's has become recognized as the starting point for the majority of discussions on globalization and world-systems theory.

The period from the sixteenth century to the nineteenth century can be described as one of proto-globalization led by the expansion of European empires. The discovery of the New World played a key role in this development, as did the complementary growth of European trading posts in Africa and Asia. This discovery allowed commodities and people to flow across the globe, with profits promoting the further accumulation of capital and greater investment. Almost the entire world became connected in a single, Eurocentric, system of trade while the migration of people—and especially the establishment of settler societies in other parts of the globe—meant that cultural exchange also began to play a more prominent role in international relations. Although Europe was at the core of this new system, there were also multilateral exchanges, including the introduction of flora and fauna to new areas and the infamous triangular trade of African slaves to the West Indies in exchange for goods then traded in Europe. It must be acknowledged that this period was distinct from the later phases of globalization in as much as it was both preindustrial and largely dependent on a system of mercantilism (i.e., the involvement of the state in

mechanisms of trade through the creation of chartered companies and similar devices).

With the emergence of industrialization in the nineteenth century, the pace of globalization increased significantly. A demographic revolution had preceded the industrial one, and the vast increase in population growth further fuelled the migration of Europeans overseas, especially to the New World and the United States in particular, increasing the level of cultural exchange. Similarly, the development of modern industry, facilitated by technological advances, created economies of scale and enabled the beginning of mass production. Manufactured products were sold internationally, and Britain, the first industrialized country, became the workshop of the world. The advent of railways and the steamship compressed journey times and aided both trade and the movement of individuals. Innovation in transport also played a key role in promoting the expansion of modern cities, which in turn became organs of further globalization. Meanwhile, financial institutions became increasingly sophisticated and international in focus. Overseas investment of capital became relatively commonplace, furthering the integration of the global economy. Imperialism remained a major force, although the new imperialism of the late nineteenth century took on a different character than earlier forms.

In the twentieth century, the path of globalization was far from smooth. World War I (1914–18) undermined globalization, and its progress seemed to halt, and even turn backward, during the interwar years. The Great Depression of the late 1920s and early 1930s led to a breakdown in international trade as countries increasingly adopted beggarthy-neighbor policies of protective tariff barriers and competitive devaluations. This trend was itself reversed after World War II, and the pace of globalization increased rapidly. This increase was especially apparent in economic terms, and the 1944 Bretton Woods conference laid the groundwork for the liberalization of trade regimes, a goal furthered by the 1946 General Agreement on Tariffs and Trade and the subsequent establishment of the World Trade Organization in 1995. International organizations such as the United Nations, military alliances such as the North Atlantic Treaty Organization, and supranational bodies such as the European Union had,

and continue to have, an impact on political integration in the world. The decline of colonial empires in the period also disconnected globalization from formal imperialism, although cultural ties, especially those predicated on linguistic factors, remain. Moreover, the advance of communications technology, especially television and the Internet, has enhanced these cultural exchanges. A particular feature of this postwar period, especially in the Western world, is the rise of multinational companies alongside the relative shift away from trade in physical goods toward the intangible trade of services and finance and the greater integration that this brought. Michael Bordo, Barry Eichengreen, and Douglas Irwin contend that this recent phase of globalization has produced a far more integrated global economy than was the case in the nineteenth century; a manifestation of this being that the 2008 financial crisis had worldwide repercussions on the economy. The late twentieth century also saw increasing resistance to globalization as movements emerged calling for the embrace of traditional culture while anticapitalist organizations critiqued globalization as a process that, by moving economic power beyond the limits of state boundaries, placed too much influence in the hands of unaccountable businesses, concerns that have continued to be heard in the twenty-first century.

Notable Theorists of Globalization

Globalization has become something of a buzzword in modern political discourse and as mentioned above, has often been used as a synonym for other issues. There are, however, a number of thinkers to whom we can turn for a more sophisticated account of globalization and its impact on the world today.

Anthony Giddens

Anthony Giddens, an architect of Third Way political thinking, considers globalization in many of his works, especially *The Consequences of Modernity* (1990). He makes an important contribution to our understanding of globalization by expressing it as a four-dimensional idea that incorporates the world capitalist economy, the nation-state system, international division of labor, and world military order. In doing so,

Giddens provides a conception of globalization that goes beyond the reductivist and commonplace interpretation that sees the phenomenon as simply a corollary of capitalism. He also sees globalization as an aspect of the modern world, one that is both dependent upon modernity and helps to shape it. The existence of such a dialogue between modernity and globalization is incompatible with, for example, the arguments of Frank on the ancient origins of globalization.

Thomas Friedman

Thomas Friedman is one of the most notable commentators on globalization working outside of academia. His work accentuates the tension in the modern world between the economic and cultural ramifications of globalization and the desire of many people to retain a distinct sense of tradition and local culture. Unlike a number of other popular commentators, he also attempts to demarcate globalization as a distinct system rather than use the term simply as a buzzword. He is also an advocate of globalization, which he sees as “flattening” the world and providing enhanced opportunities for free and fair commerce. Unlike the majority of thinkers, he sees globalization as a recent issue that emerged after the Cold War, with the fall of the Berlin Wall having special symbolic significance rather than having long-term roots.

Michael Hardt and Antonio Negri

Michael Hardt and Antonio Negri are best known for their coauthored work *Empire* (2000), in which they put forward a Marxist-derived interpretation of globalization in the modern age. Like Wallerstein, they cut across traditional disciplinary boundaries in their analysis and portray the modern world as a transitory period from old imperialism to a postmodern construct of empire where the nation-state’s role is diminished and sovereignty has been passed to a transnational and deterritorialized entity.

Joseph Stiglitz

Joseph Stiglitz's two main works on globalization are *Making Globalization Work* (2006) and *Globalization and Its Discontents* (2002). He belongs to a reformist tradition, and in both works, Stiglitz is critical of globalization as it has occurred in practice, but he expresses hope that the process can be improved through active management and better utilization of international governance in particular. Much of his argument is predicated upon his own Nobel Prize winning work in information economics, alongside that of others working in the same field. He is especially critical of the International Monetary Fund and its tendency to levy too many restrictive conditions on states in return for aid, limiting their ability to intervene in the economy and preventing development from taking place in underdeveloped countries. Reducing inequality and dispelling the idea that free markets inevitably benefit everyone are key themes in his work.

Immanuel Wallerstein

Wallerstein's world-systems theory has made him perhaps the most famous theorist of the history of globalization. Besides his historical explanation, which has already been outlined, Wallerstein believes that the world today is typified by one global system of capitalism; at the same time, he acknowledges that this system does not provide a homogenous experience. Wallerstein describes the world in terms of multiple centers of political power in the form of states that may be divided into a core and a periphery. In the periphery, there are fundamentally lower levels of social development, and this divide shows no signs of closing significantly, leading Wallerstein to conclude that this division is inherent to the capitalist system and is caused by inequalities in trade relations. In analyzing globalization and the world system, Wallerstein has been influential in pushing disciplinary boundaries in the social sciences, arguing that the study of an integrating process requires a holistic method of interpretation.

Political Ideology and Globalization

Because globalization is such a broad concept, it is very difficult to make generalizations as to how any one ideology regards it. This scope is partly a result of differing interpretations and partly a consequence that because of

its breadth, it is possible to find both positive and negative aspects within it. In general, liberalism has been the major ideological force most optimistic about globalization, subject to a number of caveats concerning the need to ensure pluralism and differing arguments as to how far the state needs to be able to intervene in the economy. Conservatives have tended to criticize globalization for undermining national culture and traditions, although many holding neoliberal economic views continue to emphasize the importance of global free markets. Socialism has provoked perhaps the most nuanced and diverse responses to globalization. While Marxists have been critical of the process, seeing it as an extension of capitalism, social democrats have had more diverse responses to the issue, often favoring its potential for harmonization but expressing concern over the limits it places on states to control their own economies. More recently, neorevisionists of the Third Way vein have been more positive toward globalization and of its cosmopolitan potential in particular, with some seeing it as an irresistible force in any case. Green political theory, although a broad church of opinion, has shown some pragmatic support for using international and supranational bodies to further environmental goals in spite of general opposition to economic globalization. Of all major ideologies, it is perhaps fascism that has been most unambiguous in its rejection of globalization, with fascists seeing the process of global integration as damaging to national integrity and the strength of the state.

Gobineau, Joseph-Arthur De

Joseph-Arthur de Gobineau (1816–82), French novelist, man of letters, and diplomat, is a relatively obscure thinker today. He is best known for his work *An Essay on the Inequality of Human Races* (1853–55), in which he developed the theory of the Aryan master race and racial hierarchy. Gobineau was convinced that contemporary European society was being consumed by a terminal degeneration. This fear was hardly a unique position at the time—degeneracy was a ubiquitous theme in nineteenth-century French letters—but it was Gobineau's explanation that distinguished him: his deterministic conception of race as the key to understanding the human condition and the entirety of human history. All other factors conventionally cited to explain degeneration—immorality, bad government, materialism, irreligiosity—were irrelevant. In the *Essay*, Gobineau created a world history that accounted for the decline of civilization as a result of degeneracy defined as the contamination of the blood-purity of so-called higher races through mixing with lower races, the universal cause of the decline and fall of civilizations. "The racial question overshadows all other problems of history," Gobineau (1967, 41) argued. His views on morality, government, intellectual movements, and the role of the individual in history, all related to his racial determinism. Gobineau's racial thought cannot be separated from his attitude toward contemporary society. His aristocratic pretensions, royalist inclinations—the son of a pro-Bourbon royalist, he added "Comte" to his name as an adult—and his disillusionment with contemporary society bred his belief that France, and

Europe, were gripped by a profound, irreversible decline. As an adult, he was familiar with his contemporary Alexis de Tocqueville, serving as *chef de cabinet* to him when Tocqueville was foreign minister and corresponding with him extensively, and he served as a diplomat under the Second Empire. He also wrote novels, *Les Pleiades* (1874) and *La Renaissance* (1877), which expressed his reactionary sentiments and hatred of democratic mass politics.

Gobineau's racial theory has three essential elements: racial particularity, racial miscegenation, and degeneration. He asserted the existence of natural and immutable inequalities among the human races from which arise intellectual and cultural inequalities. The contradiction in Gobineau's thesis is his belief that despite natural human instincts that are repulsed by race mixing, civilization can only be created through an overcoming of this repulsion through a combination of "higher" with "lower" blood—the different races representing different capabilities and potentialities. Even so, civilization of any kind is impossible without Aryan domination. Gobineau is enamored of his conception of the Aryans, who represent beauty, heroism, strength, and dignity and who are alone capable of attaining high culture and civilization. The defining characteristics Gobineau attributed to lower races were perhaps reflected in those he despised in modern man: the "yellows" represented the materialistic, mediocre bourgeoisie; the "blacks," the destructive plebeian mobs. Gobineau denies the notion of continuous human progress in *An Essay on the Inequality of Human Races*, but in his fashion, he goes to the extreme of asserting that modern man has not made any meaningful progress beyond what the ancients achieved and that all modern knowledge is merely derivative. In foreshadowing later racist worldviews, Gobineau rejected principles of universal morality, individual free will, and conventional notions of good and evil in favor of racially rooted "elite morality." Any ethical system not based on race, not conceptualizing morality and intellect in their racial context, was inconsistent with his theory. Thus, the absence of any discussion of rights and obligations in the *Essay*: this would simply have been superfluous.

The *Essay* was written to support previously held positions, so the work is highly tendentious. Gobineau was fundamentally a thinker of his time, but his political and social thought has had some enduring impact, particularly

in the interwar period, though it would undoubtedly be a bitter irony for Gobineau to know that his ideas had their greatest impact (in adulterated form) among the demagogues of the vulgar masses he despised. An adulterated version of the *Essay* titled *The Moral and Intellectual Diversity of Races* appeared in the contemporary United States (1856), and a German edition in 1897. Future racist movements, not least Nazism, selectively borrowed from but extensively manipulated his work, making it possible to exaggerate his actual influence on German racial thought, given that his ideas were often misconstrued. Nevertheless, it was through the efforts of his German devotees that Gobineau's greatest following—posthumous, as little notice was taken of him in his own lifetime—was in Germany rather than his native France. While it may be that, as Michael Biddiss puts it, Gobineau's racial philosophy of history “surpasses in scope and sinister grandeur even the pages of *Mein Kampf*” (Biddiss 1970a, 3) it is the latter work that assumes today a far greater infamy, with Gobineau now largely forgotten.

Godwin, William

William Godwin (1756–1836) is a major figure in the development of liberal and radical political thought. He is the founding father of philosophical anarchism, but his intellectual contribution is also of significance for the development of utilitarianism as a moral theory, for the development of a secular defense of the sanctity of the right of private judgment, and for the diverse ways in which he sought to convey his ideas to a mass audience. Although he is best known for his work at the time of the French Revolution, he had a long and productive life and contributed widely in literature, history, and political controversy throughout his life.

Early Life and Writings

William Godwin was born in Wisbech, Cambridgeshire, to John Godwin, a Dissenting minister, and his wife Anne. He was an intellectually precocious child and strongly influenced by his family's Dissenting beliefs: his childhood memories include the composition of a poem titled "I Wish to Be a Minister," delivering sermons to his family from a kitchen chair, and haranguing his contemporaries from the pulpit of the meetinghouse.

At eleven, having persuaded his family of his calling, Godwin was sent as a boarding pupil to Samuel Newton, an independent minister in Norwich whose theological leanings were to Sandemanianism, an extreme form of Calvinism demanding uniformity of opinion among the elect. Godwin hated

Newton for his use of corporal punishment but retained his vocation, and in 1773, he sought to complete his education at a Dissenting Academy. He was turned down by Homerton Academy on suspicion of Sandemanianism but was admitted to Hoxton, a more liberal establishment. The young scholar fully embraced the opportunity afforded him, getting up at five and reading till midnight to allow sufficient time for study.

Godwin graduated in 1778 and after some time in London and Ware, was appointed to a position in Stowmarket, Suffolk, in 1780. Here, he read French Enlightenment thinkers who profoundly shook his faith. Godwin, now moving toward deism, left his post after a dispute with his congregation and moved to London in 1782 to pursue a career as a writer.

His first published work was the *Life of Lord Chatham* (1783), intended to be the first in a series of English biographies. Thereafter, he secured a modest income by reviewing for the *English Review*; by publishing *The Herald of Literature* (1783), a collection of spoof reviews; by writing political pamphlets largely supportive of the Whigs; and in 1784, moving into literature by publishing three novellas. A regular income was not secured until 1784 when his old tutor Andrew Kippis recommended him to the publisher George Robinson to write the British and foreign sections of the Whiggish *New Annual Register*, a position that paid a stipend of sixty guineas and that he held for seven years.

Godwin's talent and intellectual precocity brought him to the attention of London's literary and political worlds, and during the 1780s, he met a wide range of political and literary figures such as Richard Brinsley Sheridan, George Canning, Hester Piozzi, and Thomas Holcroft. Holcroft was a particularly important figure in Godwin's life, and their intimacy influenced his politics and literary efforts throughout the most prolific period of his career. In 1788, he also began a diary, which he kept meticulously until his death and which reveals the wide extent of his political, literary, and artistic circles.

Peak of Godwin's Career

Godwin spent 1790 writing *St Dunstan*, a blank verse tragedy that was a thinly disguised call for the repeal of the Test and Corporation Acts, legislation that excluded Dissenters from certain civil rights. Dissatisfied with the limitations of the dramatic form and believing a more comprehensive treatment of the relationship between individual, society, and government was required, in the summer of 1791 he negotiated an arrangement by which Robinson would support him financially while he composed a treatise on political principles. The work was initially conceived as a corrective to Charles-Louis Montesquieu's *L'esprit des lois* (1748) but grew in scope and ambition in its composition, influenced by the intellectual and political controversy that surrounded Edmund Burke's *Reflections on the Revolution in France* (1790) and Thomas Paine's *Rights of Man* (1791–92). *An Enquiry Concerning Political Justice* was published in February 1793, and its importance in the war of ideas that followed the French Revolution was immediately recognized.

The treatise argues that the developing powers of the human mind will allow the gradual dismantling of institutions such as government, the judiciary, and the monarchy. This utopian future will emerge through the full and free exercise of individual private judgment and public discussion. Conversation is presented as a central mechanism through which society could advance knowledge in a measured and methodical fashion. The work combines the necessarianism of David Hartley and Joseph Priestley with the view that mind is itself a real cause and that no additional motive for our recognition of the truth of normative proposition is in itself sufficient to motivate our compliance. It develops an ideal form of utilitarianism in which the pleasures of the mind and of benevolence are qualitatively higher than those of the senses. Government and religious institutions have only served to fetter the development of mind through imposition and fraudulent assertions of authority, but the advance of knowledge is irresistible, and political and moral truth will eventually triumph. The result is a complex position in which the perfectionist doctrine of the development of the exercise of private judgment constrains the application of the principle of utility maximization.

In the final section of the work, Godwin assumes a still more speculative agenda and countenances the abolition of private property and marriage,

alongside the development of an increasingly cerebral world in which the exercise of mind supersedes the lower sensual pleasures and comes increasingly to control the processes of aging and physiological deterioration so that man may, indeed, become immortal. Two subsequent editions followed in November 1795 and December 1797, with manifold revisions, toning down the concluding sentiments, rendering the language more consistently utilitarian, weakening Godwin's earlier Platonism with regard to truth, introducing a more skeptical tone under the influence of David Hume, and refining in various ways many parts of the original work. There is also a shift toward acknowledging the importance of private affections, which had earlier been consigned to the sphere of irrational obstacles to the exercise of universal benevolence, and the more speculative parts of the final book are considerably toned down. Nonetheless, Godwin felt he could proclaim that the essential outlines of the work remained unchanged.

Godwin's concern with how knowledge could best be disseminated and society ameliorated is demonstrated in his persistent fictional and dramatic efforts over the next decade and beyond, the most successful example being his novel *Caleb Williams* ([1794] 2009), a powerful indictment of the corrupting effects of power written specifically as a platform for the ideas of *Political Justice* for those "persons whom books of philosophy and science are never likely to reach" (312).

The mid-1790s saw Godwin at the height of his fame. William Hazlitt, in his essay on Godwin in *Spirit of the Age*, wrote that Godwin

blazed as a sun in the firmament of reputation; no one was more talked of, more looked up to, more sought after, and wherever liberty, truth, justice was the theme, his name was not far off; no work in our time gave such a blow to the philosophical mind of the country as the celebrated *Enquiry Concerning Political Justice*. (Hazlitt 1915, 23)

Although Godwin disassociated himself from popular political societies such as the London Corresponding Society, he remained close to several of their members. When the government moved, in May 1794, to arrest the

leaders of the Society for Constitutional Information and the London Corresponding Society on charges of high treason for having planned a British Convention along lines suggested by Thomas Paine to test the opinion of the nation on reform, Godwin leapt to their defense in his *Cursory Strictures on the Charge Delivered by Lord Chief Justice Eyre to the Grand Jury*. It was a resounding success, and the most prominent accused, John Horne Tooke, credited his acquittal to its arguments.

In 1796, Godwin was reintroduced to Mary Wollstonecraft, whom he had first met but not warmed to at a dinner with Thomas Paine in 1791. This time things went more smoothly. They became lovers in August 1796, and Wollstonecraft subsequently became pregnant in December that year. The two initially lived their lives separately in accordance with their political principles but eventually bowed to convention and married in March 1797 to the delight of conservative critics. Their daughter Mary (later Mary Shelley) was born on August 30, 1797, and Wollstonecraft died from complications ten days later. Godwin was devastated and threw himself into the writing of her memoirs, a frank account of her life that exposed her to the ridicule of their political opponents and marked a decline in Godwin's own reputation that he never reversed.

Later Years

He continued to write novels—*St Leon* (1799), *Fleetwood* (1805)—and plays—*Antonio* (1800), *Abbas, King of Persia* (1801)—but the former had limited success while the latter had none whatsoever. In 1801, he married Mary Jane Clairmont whose children Charles and Jane were added to his own household. Money became an increasing problem. In 1805, with the help of some friends, Godwin opened a bookshop on Hanway Street in central London and established a juvenile library of publications. To avoid the opprobrium associated with his own name, it operated as M. J. Godwin & Co., but it was only a moderate success. Godwin contributed a number of historical and pedagogical texts for children, but the shop is best known for publishing Charles and Mary Lamb's *Tales from Shakespeare* and the first English edition of *Swiss Family Robinson*.

In 1812, Percy Shelley wrote to Godwin expressing rapt admiration for the author of *Political Justice*. The devotion and the potential financial assistance the wealthy young aristocrat offered seemed too good to be true, and indeed, it was. The relationship began well but foundered rapidly on the rocks of Godwin's curmudgeonly ways, Shelley's obstinacy, and Mary Jane Godwin's temper. The fact that Shelley's father kept a tight rein on his son's income did not help, either. When Shelley fell in love with Godwin's daughter, Mary, and eloped with her in 1814, the relationship was irrevocably damaged.

Despite his personal turmoil, Godwin began to write in earnest again. He published his *Lives of the Phillipses*, a history of John Milton's nephews in 1815 and added a fourth major novel, *Mandeville*, in 1817. His *Of Population*, a lengthy rebuttal of Malthus (whose *Essay on the Principle of Population* of 1798 had taken Godwin as its central target), appeared in 1820. Godwin's republican and historical interests resulted in a four-volume *History of the Commonwealth of England* (1824–28); there were two further novels; and a set of philosophical essays appeared in 1831 under the title *Thoughts on Man*. A modern reader may find the spark of his earlier works absent, but Godwin's meticulous research, patient writing, and his measured prose ensured his position as a significant citizen of the republic of letters of the early nineteenth century. His business went bankrupt in 1825, and he remained plagued by financial worries. When the Whigs finally came to power, he lobbied Earl Grey and Lord Melbourne, and in 1833, he was appointed to the post of office keeper and yeoman usher of the receipt of the exchequer, a sinecure offered by the "brute engine" (as he had referred to government in *Political Justice*) that ensured that his final years were relatively comfortable. He died on April 7, 1836, and was buried close to Wollstonecraft in the cemetery of St Pancras Old Church, London.

Conclusion

Godwin occupies an important place in the history of political philosophy. He is the first philosophical anarchist and influenced later generations of writers in that tradition; it is difficult to read John Stuart Mill's *On Liberty* without thinking that their meeting in the 1830s must have had some influence on Mill's own ideals; his version of utilitarianism is in many

respects dramatically more appealing than that advanced by Jeremy Bentham and his followers; and he represents a major figure in a decade that saw some of the most intense political controversy and intellectual experimentation, involving a wide public audience, in the history of Britain. His other writings, which are either ignored or studied only by literary scholars, are central to understanding his developing views on the two objects that absorbed him throughout his life—the nature of political, moral, and religious truth, and the means by which those in the vanguard of its discovery can communicate their findings to others so as to promote the full development of our capacities as rational beings.

Goldman, Emma

Emma Goldman (1869–1940) was born in Lithuania to a Jewish family of lower middle-class status. She achieved the equivalent of an 8th-grade education before being pulled from school to work in support of her family. As a young girl, she developed a fascination with the shadowy world of Russian revolutionaries, especially the women radicals who overthrew bourgeois convention to live sexually free, politically rebellious lives. Arriving in the United States from Russia in 1885 with the first big wave of Eastern-European Jewish immigrants, Goldman soon made her political home in the anarchist movement. For over fifty years, she worked tirelessly to create and publicize the anarchist vision of liberated individuals living cooperatively within a free society. Anarchism, she declared, envisioned a world in which strong, self-creating women and men could be free from the economic shackles of capitalism, the moral confinement of organized religion, the personal and economic constraints of conventional marriage, and the political straitjacket of the state. She saw no contradiction between the twin goals of fostering creative, autonomous individuals within free and egalitarian political communities, seeing independent individuals and supportive communities as mutually creating one another.

Much of Goldman's education took place within the anarchist movement, where radical politics mixed readily with the intellectual heritage of European radicalism, progressive theater, and American individualism. Goldman's most profound influences came from Peter A. Kropotkin and Michael Bakunin, nineteenth-century Russian anarchists from whom she

drew the broad strokes of her vision of revolutionary struggle toward a classless society. She was also affected by the more spiritual approach to politics in the writings of German anarchist Gustav Landauer, the iconoclastic rebellion of Friedrich Nietzsche and Max Stirner, the erotic poetry of Walt Whitman, and the stirring dramas of oppression and resistance by Henrik Ibsen and Gerhard Hauptman. Fellow anarchist Alexander Berkman was her teacher and co-organizer as well as lifelong comrade.

Goldman wrote five books: *Anarchism and Other Essays* (1910) collected some of her strongest lectures and essays from her monthly journal *Mother Earth*; *The Social Significance of Modern Drama* (1914) collected her lectures on the political lessons and inspirations she found in selected European and American plays; *My Disillusionment in Russia* (1922) told the story of her initial enthusiasm and ultimate radical opposition to the Bolsheviks, who, in her view, had killed the authentic Russian revolution and replaced it with a new and even more exploitative state; *Foremost Russian Dramatist* (1926) was unpublished but served as the ground for her lectures on Russian theater; and her autobiography, *Living My Life* ([1931] 2006), was widely read in progressive circles. From 1906 to 1917, she edited and published the monthly anarchist journal *Mother Earth*. A popular and effective orator, she gave over 10,000 speeches in her lifetime to many thousands of listeners in the United States, Canada, and Europe. Also an irrepressible letter writer, she wrote over 200,000 letters to several hundred different correspondents.

While, from the point of view of the authorities, Goldman and her fellow anarchists were dangerous terrorists and lunatics, Goldman was a key actor in U.S. and European progressive politics. She forged alliances with a variety of liberals and socialists to address a plethora of issues. She called for sexual freedom and the decriminalization of prostitution as part of her critique of patriarchal marriage and the sexual double standard; she defended prostitutes as exploited workers and worked to make practical information about birth control available to working-class women. She worked tirelessly for freedom of speech, which was the backbone of political organizing, including union organizing. She opposed war and militarism, appealing to the international working class to eschew national

loyalties in favor of global class liberation. She supported radical labor actions against capitalists and the state, as well as anticolonial rebellions around the world. She participated in both the Russian and the Spanish revolutions.

Goldman was arrested countless times and served three prison terms in the United States: the first for encouraging unemployed workers to “take bread”; the second for breaking laws about obscenity by circulating information on birth control; and the third for opposing conscription during World War I. After her third prison term, she was deported to the Soviet Union; fleeing the growing Bolshevik tyranny, she eventually settled in the south of France, acquired British citizenship, and resumed her practice of traveling lecturer. She died of complications following a stroke in Montreal in 1940 while working for the release of anarchists who, if returned to their native Italy, would have been executed by the fascists.

Gorz, André

Hailed by Nicolas Sarkozy as a “major intellectual figure of the French and European Left,” André Gorz (1923–2007) would have been amused by this posthumous tribute from the center-right president of France. Though his intellectual impact was perhaps never greater than when he attacked an outdated and dogmatic Marxism in *Farewell to the Working Class* (1982), Gorz was an uncompromising critic of neoliberalism who repeatedly drew on Marx to expose the irrationalities of contemporary society. Strongly influenced by the existentialism of Jean-Paul Sartre, Gorz was first drawn to the radical syndicalism of Italian trade unionists, later embracing the libertarian ethos of May 1968 and spearheading the challenge to French nuclear energy and the critique of consumer capitalism. By the 1990s, Gorz had become Europe’s best-known advocate of the post-work or multi-activity society, a model he argued was becoming less and less utopian as the high-tech knowledge economy expanded. His most important political texts include *Strategy for Labor* (1967), *Ecology as Politics* (1980), *Paths to Paradise* (1985), *Critique of Economic Reason* ([1989] 2011), *Capitalism, Socialism, Ecology* (1994), *Reclaiming Work* (1999), and *The Immaterial* (2010).

Gorz’s original birth name was Gerhart Hirsch. Raised in bourgeois Vienna at a time of virulent anti-Semitism, his childhood was marked by feelings of illegitimacy that the discovery of his own paternal Jewish ancestry exacerbated. After the family name was changed to the more Germanic-sounding Horst, Gorz was sent by his mother to a Swiss boarding school to

avoid the consequences of the Nazi takeover of Austria. Graduating with a degree in chemical engineering in Lausanne, he moved with his English wife to Paris in 1949 and began forging a career as a political journalist. He wrote under the pseudonym Michel Bosquet, working first for *Paris-Presse*, then for *L'Express*, and finally for *Le Nouvel Observateur*, which he helped found in 1964. In the decade following the war, Gorz had also devoted his spare time to a philosophical study intended as a sequel to Sartre's *Being and Nothingness*. Though it would be twenty years before *Fondements pour une morale* (1977) was published, his subsequent decision to apply the insights of this treatise to himself and to turn the resulting self-analysis into an illuminating self-portrait, was a publishing success. Owing no small part to Sartre's lengthy preface, *The Traitor* (1960) catapulted Gorz—the pseudonym he chose for his books—into the Parisian limelight, paving the way for his recruitment to the editorial board of *Les Temps Modernes* and his membership in Sartre's and Simone de Beauvoir's inner circle. In his best-selling book, *Letter to D* (2009), Gorz returned to his biography. Written a year before he and his wife's joint suicide, the book told the story of the couple's life together, revisiting, often critically, the picture he had painted in *The Traitor* and explaining the precious role that his wife Dorine had played in his own life and thinking.

The most important political theme in Gorz's work is the idea of autonomy. This idea is theorized in Sartrean terms as the capacity of the individual to take charge of him- or herself and be a responsible agent. Influenced by his friendships with Ivan Illich and Herbert Marcuse, Gorz focused on the way modern systems of production and administration undermined people's ability to think and act for themselves, inducing passive, acquiescent, and functionalized forms of behavior. In *Farewell to the Working Class*, he warned that the labor movement, by failing to interrogate the ideology of work, was becoming an inverted replica of capital. In *Critique of Economic Reason*, he contrasted the anguished freedom of the posttraditional individual with the escape from the responsibilities of judgment promised by free-market capitalism and the sterile logic of economic calculation. Gorz displayed his own intellectual autonomy through his nonacademic style of writing, infuriating some critics by neglecting established bodies of work and leaning heavily on journalistic sources. He was also criticized for

being too utopian and for romanticizing the potential for social change carried by more marginal groups in society.

Gorz was a political ecologist who warned that conventional environmental science was perfectly compatible with an inhuman social system. Though he associated the most progressive demands of the ecology movement with the defense of vernacular life, he was an unapologetic French modernist, despising all cultural, religious, and even scientific fundamentalisms. In his later writings, he drew repeatedly on the “Fragment on Machines” in Karl Marx’s *Grundrisse*, using the text to explore, often with startling prescience, the crisis that ensues when capitalism tries to sustain the law of value while more and more of society’s wealth is produced and enjoyed outside the framework of measurable labor time. This view also led him to stress the need for a system of income distribution that disconnected purchasing power from the performance of work.

Gramsci, Antonio

Antonio Gramsci (1891–1937) was one of the twentieth century's most popular and influential Marxist figures. However, his influence has been almost entirely posthumous. Imprisoned in his native Italy by the fascist regime, Gramsci's ideas reached a wider audience only after his death when, from the late 1940s onward, the Italian Communist Party published his prison writings. Since then, his work has been translated and disseminated to a global audience. Offering a notably pragmatic approach to revolution, Gramsci highlighted the cultural and political factors that sustained class rule and advocated a strategy designed to tackle them. In his analysis of hegemony, or consensual domination, he offered a nuanced appreciation of the complexities of power in capitalist society that continues to inspire theorists today.

Early Years

Born in Ales, Sardinia, in 1891, Gramsci was the fourth of seven children of a middle-class family. A number of key events determined the early course of his life. Reportedly dropped as a baby, the young Antonio grew up a hunchback, with recurring poor health. Further, when he was seven, his father, a local civil servant, was imprisoned for several years in a corruption scandal. Consequently, the Gramsci family suffered financial difficulties, and Antonio missed some years of schooling. Although he returned to his studies after his father's release, these personal and familial problems

exposed Gramsci to the vicissitudes of life in Italy's underdeveloped southern regions. He never forgot this experience, and developed into a painfully self-conscious youth.

In 1911, he left Sardinia after winning a scholarship to the University of Turin. The sub-Alpine city was then one of Italy's major industrial centers, and it was there that Gramsci studied linguistics with the possible intention of becoming a teacher. However, in 1915, he left university, without graduating, to devote himself to full-time political journalism. A member of the Italian Socialist Party, Gramsci generated local notoriety as a biting critical intellectual and committed revolutionary.

Gramsci's early socialism was strongly influenced by idealist thought, then popular in Italy. The philosophy of Benedetto Croce, in particular, encouraged numerous radicals and aesthetes to view the world in subjective terms. Croce railed against scientific positivism with its reduction of human life to a natural phenomenon. Likewise, Gramsci, writing in party newspapers such as *Avanti!*, conceptualized revolution not as a natural event but as a process of spiritual adjustment, the formation of a moral consciousness, and self-discipline among the workers. This outlook contrasted with the dominant strain of positivist-inspired Marxism in the Socialist Party, which conceived revolution as an inevitable result of the laws of historical development purportedly discovered by Karl Marx. For Gramsci, however, it was necessary to prepare the workers for revolution through moral and cultural education, not passively await its arrival. Thus, in 1917, he famously described the Russian Revolution as a revolution “against *Das Kapital*”—that is, an example of how social change was activated through a conscious, disciplined assertion of the will.

The Factory Council Struggles

It was not until after World War I, however, that Gramsci came to greater prominence in his adopted city. In the aftermath of a traumatic and divisive war, which swelled the ranks of Turin's working class, he argued that revolution meant the creation of a new state. In light of growing industrial militancy through 1919 and 1920, particularly among Turin's metal workers

as well as the experience of the Soviets in Russia, Gramsci imagined the industrial factories as the location for a workers' state.

In the review he edited with his fellow socialist intellectuals—called *L'Ordine Nuovo*, or the new order—Gramsci followed the conflicts under way in the local factory councils (grievance committees for workers) and set out a corresponding theory of a socialist state based on the democratic management of production. Influenced by elements of syndicalism, Gramsci conceived the industrial factory, with its assembly lines and divisions of labor, as the ideal space for a distinctly proletarian unification of private and public spheres. The factory state, he argued, could develop its own sense of citizenship and civic consciousness centered on the common goal of production. For Gramsci, the self-management of production offered a wholly new revolutionary model, one formed within the very heart of industrial capitalism and, unlike the Italian socialist tradition, led by the workers themselves.

The eventual failure of the Turin workers' struggles, following a month-long occupation of the factories in September 1920, and the subsequent tide of reaction that saw the rise of Mussolini's fascists, encouraged Gramsci to switch direction. In 1921, he took part in the formation of the Communist Party. At the same time, however, the fascists were expanding their support among the middle classes, now deeply unsettled by the postwar conflicts and disillusioned with the liberal government's evident weakness. After a wave of antisocialist violence, Mussolini was invited by the King to become prime minister of Italy in 1922, bringing in a raft of repressive legislation. By 1926, he had virtually eliminated all serious opposition and set about creating his dictatorship.

The Communist Party

During the crisis and collapse of the liberal state, Gramsci had been absorbed in the politics of the new party. A member of its executive committee, he was posted for a while in communist Russia and later in Vienna. In this period away from Italy, he found time to recuperate from the exhaustion of the previous years and even to meet and marry his wife, Julia. But he observed with increasing dismay the inability of the Communist

Party to organize effectively in Italy. Gramsci had originally supported the Leninist idea of the revolutionary party as a disciplined vanguard leading the workers to revolution. But now he was concerned that the party remained too aloof from the lives and struggles of its potential supporters. Moreover, its strategy reflected a crude view of revolution as the outcome of economic conditions to which the party would then respond. Gramsci had long rejected this economism (the assumed determination of social change by economic conditions, regardless of particular circumstances), and he fought against it.

In 1923, Gramsci became party leader and set about developing a strategy he believed was appropriate to Italy's peculiar conditions. This strategy was set out formally in the "Lyons Theses" of January 1926—coauthored with Palmiro Togliatti—which highlighted the late and localized development of Italian capitalism in the north, the consequent impoverishment of the south, and the complexity of class relations there. The party, he argued, needed to lead a national movement that united the northern working class with the peasantry in the countryside. Later that year, Gramsci also penned "Some Aspects of the Southern Question," which reflected on the role of intellectuals such as Croce in mediating class relations in the south so providing cultural cohesion to the otherwise unstable Italian state. It was precisely that leadership role, Gramsci indicated, that the Communist Party should emulate by securing the support of radicalized intellectuals.

The Prison Writings

The authorities in Italy arrested Gramsci in November 1926 on trumped-up charges and sentenced him to twenty years in prison. Removed from the day-to-day activity of politics, he took the opportunity to reflect critically on the issues that had concerned him just before his arrest. Between 1929 and 1935, in a series of twenty-nine notebooks, he jotted down essays and comments, as well as reviews of articles and books he came across in the prison library or was sent from outside. Along with his letters, these notebooks form what are now known as his prison writings. Censored by the prison officials, and therefore often written in a coded language, they contain a vast, if unsystematic, collection of reflections, commentaries, and explorations of a range of themes related to Italian history and politics,

culture, and philosophy. Although he was afforded a chance to write, the authorities nevertheless neglected Gramsci's health, which deteriorated badly over the years and ultimately stopped him from continuing his studies.

Gramsci wrote and rewrote his notebooks, revising them and reordering their contents as he went along. While he touched upon a wide variety of topics, the guiding thread of his notebooks was undoubtedly the concept of hegemony. Signifying domination or leadership, hegemony joined together a series of Gramsci's concerns about how to conceptualize the revolutionary process. The concept was borrowed directly from Russian debates about working-class leadership of subordinate groups. But Gramsci added another dimension based on the Italian use of the word, implying cultural influence. Developed that way, Gramsci's usage of hegemony denoted a form of class power characterized by the active consent of allied groups and classes.

His use of the Machiavellian distinction between force and consent, common to Italian political discourse, implied that class rule involved a variation depending on the situation. Instead of Marxism's traditional model of politics, which understood the ruling class to exercise actual or threatened violence over the proletariat, Gramsci insisted on the importance of winning consent in modern capitalism. In this respect, the state was not only an instrument of force for the bourgeoisie, but also a device designed to develop agreement. Using the distinction between political society and civil society, he argued for an integral conception of the state that incorporated both the dimensions of force (the state in a narrow sense) and of hegemony (consent across civil society). This enlarged concept of the state encompassed a potentially shifting balance of force against enemies, who could not be won over, and consent from those who could.

How, according to Gramsci, was consent won? He suggested that hegemony entailed the dissemination of an ideological worldview, a shared intellectual and moral outlook that formed into a spontaneous common sense of unquestioned values and beliefs. Ideology, he argued was not, as Marxists often claimed, simply false knowledge or propaganda. It consisted in beliefs and values that gave shape to experience and was therefore bound up with the practical organization of life. By extending and then appealing

to this practical common sense, a class could exercise a form of leadership over groups that may otherwise oppose them. This was a subtle form of subjective control through which a leading class compromised its immediate economic-corporate interests to sustain a wider coalition. That way, potentially disaffected or excluded groups were encouraged to identify with a particular social order. Gramsci argued that it was the capacity of a class to extend its influence throughout the private and autonomous organizations of civil society rather than impose on them from above, which secured its hegemony. Often that meant infiltrating and refashioning already existing forms of common sense, shaping popular ideologies toward beliefs that endorsed a preferred organization of society.

At the center of Gramsci's reflections on hegemony was the category of the intellectuals. It was they who, for him, had a vital place in the formation of hegemony. Developing thoughts sketched before his arrest, Gramsci distinguished between organic and traditional types of intellectuals. All men, he argued, were intellectuals in so far as they processed thoughts, but only some had the social function of intellectuals. Organic intellectuals were those organizers of knowledge who were closest to their social class and who provided their members with an intellectual justification and identity. The traditional type, on the other hand, were those intellectuals left over from previous social orders, such as philosophers or ecclesiasts but who, such as Croce, retained a degree of prestige and authority. Both were important in generating and embedding hegemony through intellectual and moral guidance, developing forms of knowledge and ideological legitimacy for the social order. If the bourgeoisie once had entrepreneurs and businessmen to undertake this task, the working class now had technicians and engineers. Hegemony, argued Gramsci as a Marxist, was always rooted in the practical organization of economic life.

The prison writings also contain Gramsci's efforts to reframe Marxism as a general philosophy of politics. Once more opposing those who defended it as a science of society—in particular, the Russian Mikhail Bukharin—Gramsci argued for a Marxism sensitive to the politics of building hegemony. That meant rejecting economism—which reduced ideology and politics to a reflex of economic conditions—and incorporating an idealist outlook imported, in part, from Croce. Gramsci's notebooks contain

numerous critical encounters with Croce's liberal philosophy. Yet he broadly endorsed the philosopher's emphasis on subjectivity as an integral part of human engagement with historical circumstances. Marxism, he claimed, following the Italian philosopher Antonio Labriola, was a philosophy of praxis in which thought and action combined dialectically, not a science above history. As such, it required its proponents to understand the complexity involved in generating consent, the ebb and flow of ideological and political conditions, in addition to the economic structures of society.

Finally, Gramsci suggested how an alternative hegemony led by communists might be prepared. Still a committed Leninist, he understood the party to have the key role in leading workers to revolution. But his vision of the party, conceived as a "Modern Prince" (following Machiavelli, again) winning over intellectuals and disseminating ideology to build an alternative, consensual basis of support, went much further than Vladimir Illyich Lenin's narrow conception of the vanguard. Gramsci's party was expected to cultivate a new civilization with mass support through a war of position across civil society, holding off the inevitable moment of force (or war of maneuver) until the last minute. If this was certainly not an exclusively parliamentary road to revolution, nevertheless it was a distinctively gradualist conception.

Influence

Gramsci died in Rome in 1937 from a cerebral hemorrhage. He was forty-six years old. His writings were smuggled out of prison by his sister-in-law and eventually published. Since then, they have been instructive in various ways, despite (and possibly even because of) their fragmented nature. Suggestive and inventive rather than conceptually rigid, different remarks in his notebooks can be emphasized for contrasting purposes. Gramsci's attention to the so-called superstructures has influenced contemporary Marxist approaches to politics and the state. The theory of hegemony has provided a plausible explanation for the continued survival of capitalism and the failure of revolutionary politics in developed states. More recently, Gramsci's concepts have been extended to the fields of international relations and international political economy.

Despite his Leninism, Gramsci is regarded by many as a pluralistic and even democratic thinker. His arguments about hegemony, ideology, and common sense have been central to the conceptualization of popular culture as a form of resistance to dominant social groups. For some, he is even a forerunner of postmodern theories of power and discourse and anticipates a post-Marxist interest in social movements.

Green, Thomas Hill

Thomas Hill (T. H.) Green (1836–82) was the first of what has come to be called the British idealists, a philosophical movement that did much to influence the development of metaphysics, ethics, political philosophy, and aesthetics between the mid-1870s and the late-1920s. As a Fellow of Balliol College, Oxford, and from 1878 Whyte's Professor of Moral Philosophy, Green taught many of those who became leading figures in the movement (e.g., Bernard Bosanquet, Francis H. Bradley, Richard L. Nettleship, David G. Ritchie, Arnold Toynbee) and was a close friend to others including Edward Caird. Politically, Green was an Advanced Liberal with radical leanings, something that was reflected in his adherence to a form of republicanism combining ideas from evangelicalism, Thomas Carlyle, the Christian Socialists, Giuseppe Mazzini, and others. Green adopted many radical positions throughout his life. Domestically, he argued for reform of terms and conditions at work to help protect workers, land reform, liberalization of divorce laws, women's education, and temperance reform, as well as advocating the growth of responsible trade union action as a replacement for the Poor Law, which he saw as a morally corrupting institution that served to entrench the current servile position of the working classes. He also worked for the extension of the franchise in the lead-up to the (1867) Second Reform Act. He supported Mazzini's position during the Italian Risorgimento, opposed the slave-owning South in the American Civil War, and opposed British involvement in the Crimean War. He was elected twice as a town councilor in Oxford. An estimated two thousand

mourners attended his funeral, following his unexpected death from blood poisoning in March 1882.

Personality, Self-Realization, and Freedom

Green embraced ancient Greek and German philosophy from early in his intellectual life, probably as a result of reading Carlyle whose analysis of the social problem also influenced him greatly. While many of Green's published works focus on the philosophies of Aristotle, Immanuel Kant, and Georg Wilhelm Friedrich Hegel, he became increasingly critical of both Kant and Hegel. The founding principles of his major philosophical work, *Prolegomena to Ethics* (written 1878–82, published posthumously 1883), show striking similarities to those defended by Johann Gottlieb Fichte in the 1790s, particularly a shared emphasis on the self-projection and self-realization of the “I” through active participation in social and economic institutions. Such a debt to idealism has led to a great many misunderstandings of Green's (and Fichte's) philosophy. Despite what some critics have alleged, Green and the other British idealists did not deny the existence of an external world. They held merely that it was unknowable to human beings. As Green put it habitually, the only world that can exist for us is the world that we know, and the only world in which we can act and upon which we can reflect critically is one that is shaped by the ideas through which we make sense of ourselves, others, and the environment in which we interact. Entailed by this position is Green's contention that society's institutions exist only through the attitudes that persons have to one another. This idea applies to social institutions such as the family and to economic institutions such as the right to private property, as well as to political institutions such as the state. The institutions embody ideas regarding the nature of persons, including what those persons are and how they should be treated. By participating in institutions, the individual comes to internalize and then reflect on these ideas. These processes bring out and give content to meanings and values latent within the individual, even if he or she does so in a confused manner that causes unease and alienation for the individual. Green understands this process as one in which the divine element immanent within each human being (which he calls the “spiritual principle” or the “eternal consciousness”) is brought out in the world in determinate, changing, and historically situated ways. Green's tendencies to

refer to the individual as a vehicle for the eternal consciousness, and to this process as one whereby God is manifested in the world, has led many scholars to see Green's philosophy as relying upon a form of mysticism. Others read the eternal consciousness as Green's conception of a latent human nature (a phrase Green himself uses in this context), which requires social interaction if it is to be developed in the world. On this second reading, Green's position is far closer to theories of alienation such as one finds in other offshoots of Aristotelianism and Hegelianism, including Marxism.

Green holds that every interaction between individuals is fundamentally a process whereby each party expresses some feature or features of him- or herself and becomes aware of the other participant's interpretations of and reactions to those features. He sees this process of what some now call (rather misleadingly) intersubjective recognition as being central to the individual's changing self-understanding and indeed to the gradual formation of his or her personal identity. In forming one's self in this way, one is also coming to embody certain meanings and values, the most significant of which have always been latent within one's underlying human nature (the eternal consciousness). In a sense, Green combines the philosophies of Kant and Aristotle. He holds that, ultimately, any act an individual performs is moral to the extent that he or she, as a rational being, performs it out of reverence for a categorical imperative. To this Kantian claim, Green adds the further Aristotelian claim that a society is enriching only to the extent that it allows the individual to develop his or her highest potentials to be wise, courageous, self-disciplined, and just. None of these potentials can be specified in abstraction from determinate cultural contexts. What it was to be virtuous for an ancient Greek differs from what it is to be virtuous now. (Green believes that whereas courage was reserved for the soldier in ancient Greece, it extends to the social reformer in mid-Victorian Britain.) Even within a particular society at a particular time, precise specifications of the requirements of virtue will vary depending on the individuals concerned, their history, character, and circumstances. Consequently, the person who can best decide how any particular responsible adult should act is that individual him- or herself, not the state or the society.

Bound up with this argument is Green's theory of freedom. In his famous essay "Two Concepts of Liberty" (1958), the intellectual historian Isaiah Berlin accused Green of believing that an agent was positively free to the extent that he or she performs actions that are in his or her real interests. On Berlin's reading of Green's theory, in principle acting out of fear of punishment by the state was just as free in a positive sense as acting out of one's own conscientious judgment. Berlin's accusation has been discredited by contemporary scholars. In reality, Green held to a modified Pauline conception of true, real, or positive freedom: an action is free in this highest sense of freedom to the extent that the agent performing it subjectively seeks the attainment of an object or end that is truly valuable and does so because it is truly valuable. As has been noted above, which particular objects or ends are truly valuable depend of the agent's character and context, and the person who is best placed to identify them is the agent him- or herself, by consulting his or her conscience and personal feelings of alienation or satisfaction.

This is a controversial position in a number of ways. One is the degree to which it appears society reaches into the individual—that is, the extent to which each of us is a product of our society. One response is that Green is concerned with free action, which he places outside the sphere of instinctive action. Indeed, at times he anticipates Sigmund Freud's theory of sublimation, whereby animal instincts are transformed in ways that benefit the agent as a socially situated being with higher capacities (anger manifests itself as indignation at social injustice, something that drives the reformer).

The Common Good, Rights, Duties, and Obligations

Green's Kantianism is further evident in his claim that ultimately an individual can only truly value a way of life to the extent that it arises out of processes that either presuppose or explicitly affirm the moral worth of all the participants. To the extent that it does not do so, the individual will always feel some degree of self-alienation. Consequently, a society is enriching to the extent that it is what Kant called a "kingdom of ends." Green believed that when combined with the need for intersubjective

recognition and the contextualized specification of one's highest capacities and needs, truly valuable actions always aim ultimately to secure ends that the individual enjoys as a member of his or her community. The internal complexity of modern communities helps rather than hinders the development of their members. Different substate institutions and associations draw together different people to realize different ends or common goods. In so doing, they foster a range of skills and virtues in their members. A healthy society is a network of such associations structured by an overarching (necessarily more general) common good.

Most, if not all, contemporary scholars hold that Green goes too far by claiming that every valuable action serves common goods of this type. Nevertheless, Green is correct in relation to a very important set of cases: those relating to the individual's civil, economic, and political rights. For example, living within a free society is a common good. It is not enough that others and I do not happen to be, say, silenced at any particular moment. Rather, a free society is one in which each of us is assured of not being silenced and feels that assurance because we know our fellow citizens recognize a right to free expression. The precise nature and limits of the right to free speech will vary between societies depending on their history and circumstances. In this sense, rights emerge from and structure the interactions of members of one's society. For this reason, Green argues that while one can claim a right against the state, one cannot claim a right against society. Here, it is vital to appreciate that Green is describing the nature of rights, rather than justifying them. He is not claiming that all conventional rights should be upheld and enforced simply because they are conventional. The continued existence of all rights (and indeed any other normatively significant entities) does suggest that they are endorsed by members of society, or else they would fade away as individuals failed to ascribe any practical weight to them. Nevertheless, the citizen should always reflect critically on the value and relevance of conventional meanings and values. Where he or she believes society is not living up to its highest principles, the reformer has a duty to push for improvement including the modification of conventional meanings and values (see below).

Green extends and deepens his position by distinguishing between moral rights and duties on the one hand, and legal rights and obligations, on the other. Legal rights and obligations are not simply moral rights and duties enforced through law. Indeed, some moral rights and duties would be destroyed if they were enforced legally. As noted above, virtuous action requires the individual to act from a (Kantian) good will, something that requires the individual to act out of reverence for the moral law, rather than from fear of legal punishment. Nevertheless, legal enforcement is required in those instances where it is important that certain actions are performed (or abstained from) irrespective of the agent's motive. Ultimately, only the state has the authority to decide which rights and obligations should be recognized legally. It should do so by considering the practices prevalent in the society at the time and the goals to be achieved by giving legal force to rights and so on.

Conscientious Citizenship, Democracy, and Economic Power

The diversity of substate associations and values ensures that society's common good is continually contested. This fits with Green's prioritization of contextualized personal judgment. He is very concerned that every individual should constantly question, and where necessary work to reform, established social, economic, and political structures. Green's position is not motivated simply by pragmatic concerns. As has been noted, he holds personal conscience to be the partial manifestation of the eternal consciousness within the individual. Consulting one's conscience is a vital part of each of these critical processes. Philosophy can provide at best a static understanding of existing structures, rather than definite guidance for practical reform. Only the engaged, conscientious individual can grasp what change is needed and how to best go about achieving it. Consequently, the primary role of the philosopher is analysis not prescription. This belief that one does not need to be a specialist to help moral knowledge to develop over time underpins much of Green's respect for ordinary members of the working class. It runs counter to the often unconscious elitism that continues to inform the attitudes that many other normative and applied philosophers hold regarding the significance of their discipline.

Yet, for Green, the individual's conscience reflects the individual's particular perspective, and as such, it sees only part of the picture. The more perspectives that are taken into account, the more complete the picture, and therefore, the better the final judgment. It is for this reason that, in 1867, Green advocated the extension of the franchise to all men living in cities. He hesitated about calling for the extension of the franchise to women and to the agricultural poor on the ground that currently too many members of both groups were kept in a state of childlike ignorance and naivety. It was for this reason that Green worked for the extension of higher education to women and the poor, as well as for the reform of the divorce laws to empower women. Moreover, it underpinned his support for temperance reform. He pushed for the immediate extension of democratic control of local and municipal government, having far greater trust than John Stuart Mill in the ability of working classes to control their own neighborhoods. He did not wish the middle classes to inculcate the workers into middle-class beliefs about how to govern. Instead, the poor should be trusted to rule as they see fit, for example, in relation to the issuing of liquor licenses and other matters of local, municipal, and national importance.

Green's faith in the working classes extended into the economic sphere. He believed that capitalism could be made to function as a fair system of production. Nevertheless, he saw vividly the injustices of many existing laws that gave capitalists and landowners powers to impose abusive conditions on their workers and tenants. Even though it has been claimed that Green's philosophy laid the foundations of the welfare state, he himself saw the Poor Law as discouraging the poor from asserting themselves against employers and landowners through trade union action, as well as leaving them at the mercy of a patchy and unreliable system of charitable provision. Nevertheless, Green recognized that, prior to the development of an effective trade union movement, the Poor Law remained necessary. He was also a fervent supporter of the cooperative movement, pushing for workers to band together in associations to purchase goods in bulk and therefore at a discounted price. These practical solutions embody the core principles and aspirations of Green's political thought: that by using the state and popular associations to empower individual conscience, collective action would help to liberate the poor and vulnerable from the exploitation and cruelty of the economically and socially powerful. In this way, an

enriching community could be brought into being via the popularly driven reform of one's existing institutions and practices.

Guild Socialism

Guild Socialism

Guild socialism was developed in Britain between 1907 and 1923. It was a system of ideas driven mainly by socialist intellectuals who felt uninspired by what the Labour Party and the Fabian Society had to offer but who were also fearful of the revolutionary turmoil championed by Marxists and syndicalists. Guild socialism was, in many ways, a compromise between the paternalism of state socialism and the anger and energy of revolutionary socialism. Its main advocates included Arthur Penty, Alfred Orage, Samuel Hobson, and G. D. H. Cole. Writing in such journals as *The New Age*, *The Guildsman*, *The Church Socialist*, and in some key texts (see Further Readings), the guild socialists helped to draw attention to the problems and limitations of both state socialism and revolutionary socialism. Although guild socialism as a distinct body of thought had faded by 1923, the spirit of guild socialism can be detected in the ideas of the New Left and in Green political thought.

Many forms of guild socialism rested upon an economic and ethical critique of the wage system. The wage system was criticized for exploiting and dehumanizing workers by treating their labor as a commodity that could be bought, sold, and discarded in the interests of profit. According to John Hobson, the wage system rendered workers servile by stripping them of their humanity. This servitude in turn made workers less likely to want to engage in broader political activities and allowed a minority of active citizens to impose their will. The alternative consisted in establishing a system of guaranteed payment to enhance the material security of workers

and to remind workers of the importance of their labor for their own spiritual well-being. Once liberated from the economic and spiritual torment of the wage system, it was hoped that the workers would become active citizens and help to transform the political system.

The guild socialists believed workers needed to unite and undermine the wage system through union activity. Rather than strike for higher pay, unions were to demand the right to discipline their own workers and to distribute pay to their members. A contract would thus be formed between employers and unions that would sever the link between employers and individual workers. Further concessions could then be demanded until the employers were deprived of all of their functions. By then, the employers would no longer be able to justify their ownership of companies, and it was felt that entire industries would, in this way, be made suitable for state ownership.

Many of the guild socialists wanted to establish a system of state ownership and worker control of industry. Although the state was to own industry, it was felt that a system of nationalization in which industries would be run by politicians and by bureaucracies imposed by the state would do little to liberate workers from the shackles and psychological damage inflicted by the wage system.

The guild socialists, as their name indicates, wanted to place industry under the control of guilds. Guilds had existed since medieval times to protect workers from unfair competition. While some guild socialists were in favor of restoring these local craft guilds, the majority of guild socialists called for the formation of national guilds run by the workers in each industry with responsibilities toward the community. By depriving the state of the obligation to run nationalized industries, it was hoped that the state could turn its attention to other functions. For Hobson, the state should focus its attention upon the broader spiritual welfare of the nation. For Cole, it was important for the state to represent the interests of consumers.

Although the guild socialists believed that the socialist transformation of society would transform the values held by workers, they wanted to make sure that the community was protected from any selfish or antisocial activities on the part of the guilds. While the guild socialists were more

willing than state socialists to extend the powers of the working class, the limits they wanted to place on the working class distanced them from many Marxists.

Habermas, Jürgen

Jürgen Habermas (1929–) is one of the most influential German social philosophers of the twentieth century. Besides his academic work, he regularly contributes to political debates, often playing the part of the liberal conscience of Germany. A staunch defender of Enlightenment principles, he sees modernity as an “unfinished project” that needs to be protected from neoconservative and postmodern critics who attack and undermine the principles of Western liberal democracies. Habermas’s most important works include *Structural Transformation of the Public Sphere* ([1962] 1989), *Knowledge and Human Interests* ([1968] 1998), *The Theory of Communicative Action* (1981), *The Philosophical Discourse of Modernity* ([1985] 1987), and *Between Facts and Norms: Contributions to a Discourse Theory of Law and Democracy* ([1992] 1996). In addition, he regularly publishes his political opinions in newspapers and magazines.

The scion of a West German middle-class family, Habermas grew up in Gummersbach. He was drafted into the German army in the later stages of World War II. The chaos of postwar Germany and the revelations about Nazi atrocities left a lasting impression on Habermas and helped determine his future political stance. From 1949 to 1954, he studied philosophy, history, psychology, and German literature at the universities of Göttingen, Zurich, and Bonn. In 1954, he graduated with a doctorate in philosophy on Friedrich Wilhelm Joseph Schelling, supervised by the philosopher Erich Rothacker, and worked as a freelance journalist before joining the Institute for Social Research in Frankfurt in 1956, where he became an assistant of

Theodor W. Adorno. Having lost the confidence of Institute Director Max Horkheimer, however, he moved to the University of Marburg, where he defended his *Habilitation* on the structural transformation of the public sphere, supported by the political scientist Wolfgang Abendroth. In this historical-philosophical study, Habermas developed a notion of free public discourse as the backbone of liberal society. In 1961, he became professor of philosophy at the University of Heidelberg, and in 1964, he returned to Frankfurt, where he succeeded Horkheimer in the chair of sociology and philosophy. From 1971 until 1983, he was codirector, together with the physicist Carl Friedrich von Weizsäcker, of the Max-Planck-Institute for the Study of the Conditions of Life in the Scientific-Technical World at Starnberg, Bavaria. During this time, Habermas underwent his own linguistic turn, absorbed the philosophy of language and linguistics, and produced his magnum opus, the two-volume *Theory of Communicative Action*, in which he formulated a consensual theory of “discourse” and the “ideal speech situation” as the foundation of society. In 1983, he returned to the University of Frankfurt as professor of sociology, teaching there until 1994. Since his retirement, he has continued to contribute regularly to political debates, most recently in a dialogue with Pope Benedict XVI on the role of religion in a secularized world.

While working at the Institute for Social Research, Habermas had contributed to an empirical study on university students’ attitudes toward politics, criticizing the apathetic nature of the “skeptical generation” of the 1950s. In the 1960s, Habermas’s unorthodox Marxism made him a popular figure with the West German student movement, which he in turn supported in their critique of the existing liberal order of the Federal Republic of Germany. While Habermas grew increasingly concerned about the radicalism of the left-wing students and accused them of leftist fascism, he kept defending the upsurge of student activism of 1968 for its positive effects on the political culture of West Germany. In 1973, Habermas edited an important study on the crisis of legitimation in capitalist societies. In the 1980s, he started a much-publicized debate about the singularity of the Holocaust when he rejected attempts by neoconservative historians to normalize the official view of German history. Instead, Habermas urged his fellow countrymen to adopt a postnational identity. Borrowing a concept from the political scientist Dolf Sternberger, Habermas presented

constitutional patriotism as the only option open for postwar Germans. Consequently, Habermas became an enthusiastic proponent of a unified Europe but remained critical of the unification of the two German states in 1990.

Habermas's influences are as varied as his large oeuvre: well-versed in the traditions of philosophical idealism, he was much influenced by, but also highly critical of, Martin Heidegger's existentialism. In line with the tradition of the Frankfurt school and mediated by Herbert Marcuse, he combined theories of the early Karl Marx with Sigmund Freud's psychoanalysis. His focus on language and discourse are the product of his reception of the philosophy of the late Wittgenstein, of American pragmatism (Charles S. Peirce, George Herbert Mead, John Dewey), and the philosophy of language (J. L. Austin, John Searle, Noam Chomsky). From the 1970s, Habermas critically reviewed the systems theory of the German sociologist Niklas Luhmann. In the 1980s, he was influenced, by way of critical reception, by French poststructuralism, notably Jacques Derrida, Jean-François Lyotard, and Michel Foucault. Translations and regular invitations as a guest professor at American universities have made Habermas one of the best-known and most widely discussed German social philosophers of the second half of the twentieth century.

Hamilton, Alexander

Hamilton, Alexander

As an early American statesman, Founding Father, economist, and political philosopher, Alexander Hamilton (1755 or 1757–1804) has many claims to fame. Hamilton is perhaps best known as the principal author, along with James Madison and John Jay, of *The Federalist Papers*, a series of articles of fundamental importance in American constitutional history, but Hamilton was also an influential politician and political economist whose views were crucially important in providing the ideological framework of the American Republic.

The illegitimate son of a Scottish merchant, Hamilton was born in Nevis, in the British West Indies. After serving a commercial apprenticeship, he studied at King's College (now Columbia University), New York, and precociously wrote two pamphlets, *A Full Vindication of the Measures of Congress* (1774) and *The Farmer Refuted* (1775), which displayed an impressive grasp of the principles of constitutional government. During the war of independence, Hamilton served as a field commander and then as George Washington's secretary and advisor. At the end of the war, he became politically active, and as a delegate to the Annapolis Convention of 1786 who was dissatisfied with the Articles of Confederation, he drafted the call for the 1787 Federal Constitutional Convention to formulate a new Constitution.

Hamilton was principal author of a series of articles arguing for the inadequacy of the Confederation, and for the ratification of a new, federal

constitution. This series of essays, in *The Federalist* (1787–88), subsequently known as *The Federalist Papers*, was intended to secure support for the new Constitution but also became a classic commentary on American constitutional law. Hamilton's advocacy of a strong, centralized federal government was approved by Washington, and as proponents of the new Constitution, the Federalists were politically dominant throughout the 1790s. Like many of the revolutionary founders favoring the ouster of the British colonial government, Hamilton later became an advocate for strong governmental power over popular democracy.

In 1789, Washington chose Hamilton as secretary of the treasury, a position from which he presented a highly influential succession of policy proposals on public credit, exchange, and debt. Hamilton's *Report on Manufactures* (1791) called for a protective tariff to encourage American "infant industries," a policy designed to increase the interdependence of states and strengthen the Union. Hamilton's call for the establishment of a national bank, industrial tariffs, bounties for agriculture, and a network of internal improvements promoted by the federal government, similarly aimed at promoting a strong federal political structure and a key role for the national government in promoting the economic development of the new nation. Hamilton argued that as more advanced nations could operate more efficiently and crucially, more cheaply, than emerging new nations, the trading relationship between agricultural and manufacturing nations always favored the latter. As foreign demand for American agricultural produce was casual and occasional, because of distance, taste, and high freight costs, Hamilton feared that with a predominantly agricultural economy, America would suffer a permanent trading disadvantage.

Hamilton therefore argued that the United States ought not to be dependent on Europe for manufactured goods and should possess the ability to produce all essential goods. Hence, he called for the establishment of a regulatory system of protective duties and import prohibitions for industry. Although most of his proposals were adopted, Hamilton resigned his post in 1795 after failing to obtain his protective tariff. Nevertheless, his economic ideas proved to be highly influential as the economic role of the national government steadily increased with the growth of the U.S. population. In the nineteenth century, the American economists Henry Clay and Henry

Carey elaborated on Hamilton's theories, viewing British free trade as a commercial system leading to tyranny and slavery for the rest of the world.

Hamilton's federalism and his commercial proposals received support from financial and mercantile interests in the North and served to create opposition to the political philosophy of Thomas Jefferson. The Jeffersonian system favored the rights of individual states and in favoring an agrarian republic of smallholders, assumed agriculture to be the basis of the American economy. Unlike Jefferson, Hamilton distrusted local self-government and popular democracy, and he used his formidable intellectual powers and administrative skills to advance the cause of a strong and centralized federal government. During the administration of John Adams (1797–1801) these ideological differences led to the emergence of two distinct political parties, with the Federalists led by Hamilton opposed by Jefferson and Madison's new Republican-Democratic Party.

Hamilton's political theory was largely determined by the demands of creating a new political framework for the young republic. He was not a pure theorist, nor was he the founder of any school. Nevertheless, for his role in advocating and forging the central components of the American Constitution and American financial and commercial policy, Hamilton continues to be an influential figure. For over two centuries, the two prime contenders in American political thinking have been the Hamiltonian preference for a vigorous and powerful national government and the Jeffersonian call for decentralized, participatory democracy. Hamilton's contribution toward constitutional law, especially in the *Federalist Papers*, was part of his political legacy, and it continues to exert an influence on constitutional theory and practice, often referred to by policy makers, lawyers, and historians in interpreting the constitutional propriety of Supreme Court decisions.

Havel, Václav

Václav Havel (1936–2011) was born in Prague on October 5, 1936, into a successful entrepreneurial and political family. Havel's advantaged life ended in 1948 when the newly ascendant communist government seized his family's property. Havel's bourgeois background made him suspect, and he was denied admittance to university in his chosen area of the arts. Despite a paucity of formal training, he entered the theater, eventually rising to fame as a dramaturge and especially as a playwright in the style of the theater of the absurd.

Havel's theatrical career was interrupted when Warsaw Pact forces invaded Czechoslovakia in 1968 to put down the Prague Spring, an initiative dedicated to opening up the communist system by granting greater freedom. Havel came to prominence in the aftermath of the Soviet occupation during the era of normalization, a dull, depressing period in which communists kept power by thwarting spontaneity, personal initiative, and deviation from the Soviet model. Havel's avant-garde plays were banned, and he was barred from the theater.

Havel turned his energies toward social activism by helping to found Charter 77, the leading human rights organization in the communist world. He penned essays promoting opposition to communism, including his best-known work, "The Power of the Powerless." It attacks communism as antithetical to the variety and complexity of human life. In Havel's view, communism's goal of utterly transforming the human condition inevitably

became a merciless ideology. Under the dictatorship of Joseph Stalin, Marxist ideals had been used to justify the most heinous crimes. After Stalin's crimes were fully exposed in the 1970s, few Czechs (or others) continued to believe in the communist dream, but powerful centralized governments and arrogant bureaucracies persisted throughout the communist world. He argued that the communist ideology forced people to pretend that they believed. The central fact of would-be totalitarian rule under communism was the lie; Havel called his resistance toward it "living in truth." For opposition to government policies, his peculiar plays, and his defense of a banned rock group, Havel was imprisoned several times and once for many years.

Havel also criticized the dominant principles of contemporary Western civilization, whether socialist or capitalist, as materialist and relativistic, implying that moral judgments have no ultimate truth but are socially constructed or are matters of personal choice. Havel argued instead that judgments about good and evil are based in the phenomena of daily life, what he calls the natural world. In the natural world, principles such as love, honor, justice, and friendship become evident—they are inevitably part of the human condition, as are selfishness, envy, cruelty, and hate.

Havel's plays, suppressed by the communist authorities but translated and performed internationally, are in the tradition of absurdist theater created by Eugene Ionesco and Samuel Beckett. Plays such as *The Memorandum* (1965) and *Largo Desolato* (1984) attempt to capture the loss of identity, which might be defined as the absence of a relationship beyond one's physical existence. They expose the absurdity of modern bureaucracy as well as the moral and psychological ambivalence of leaders, whether official or rebel. In the symbolically autobiographical *Largo Desolato*, Havel turns his critical acumen on himself and by extension, other leaders of the people. Not only should ordinary citizens resist oppressive state authority, but also they should avoid dependence on heroic populist leaders like himself. Yet his plays do not proclaim the meaninglessness of existence, but endeavor, instead, to highlight the complexity of life and the absurdity of antifoundationalism, or relativism. The plays present the awareness of meaning's absence but simultaneously the abiding human longing for meaning. No society has ever existed without a moral code;

hence, moral guidelines are a natural part of life. Yet no society is fully moral; hence, nature does not dictate or ensure morality. Life is a constant tension between the poles of meaning and nothingness. To surrender our judgment entirely to strict moral codes makes us too self-righteous and blind to life's complexities, but to yield to nothingness leads to disempowerment and hopelessness. Being discloses itself partially to us. We get a hint of what is proper and fitting, but not a roadmap. If we were given too much, there would be no choice and therefore, no freedom or dignity.

In 1989, Havel became the first postcommunist president of Czechoslovakia, using his official position as a bully pulpit to promote social responsibility. As president, he took the bold and controversial action of granting amnesty to political prisoners, including many communists. Havel proposed constructing civil societies at the local level, at which moral responsibilities are experienced personally by citizens seeing the needs, hopes, and desires of their fellow human beings. Although Havel opposed the 1992 breakup of Czechoslovakia into the Czech Republic and Slovakia, he was elected to serve two terms as president of the Czech Republic from 1993 to 2003.

In addition to serving his homeland, Havel became a political and intellectual figure of international renown, befriending the Dalai Lama, taking U.S. President Bill Clinton to Prague's Reduta Jazz Club (where Clinton played the saxophone), receiving the U.S. Presidential Medal of Freedom and many other awards, and addressing the U.S. Congress to overwhelming acclaim.

Havel used his fame to promote a restructuring of politics so that people can experience the fulfillment of citizens taking part in small, tightly knit communities, realize their authentic selves, and enjoy the safety of an integrated and peaceful world.

After retirement from politics, Havel published *To the Castle and Back*, one of the oddest and most ironic political memoirs ever penned. In 2008, he wrote his first play in 20 years, *Leaving*, a tragicomedy about a former political leader. *Dozens of Cousins*, a short sequel to his earlier plays about the character Vaněk, appeared in 2010.

At his death in December of 2011, Havel was serving as chair of the international Human Rights Foundation, based in New York. He was remembered by expatriate Czech novelist Milan Kundera (The *Unbearable Lightness of Being*): “Vaclav Havel’s greatest work is his own life.”

Hayek, Friedrich

Friedrich Hayek (1899–1992) was an important twentieth-century political theorist who played a key role in the revival of classical liberalism after World War II and was subsequently influential in the 1980s during the administrations of U.S. President Ronald Reagan and British Prime Minister Margaret Thatcher.

Education and Early Career

Hayek studied law and economics at the University of Vienna, where he worked with Friedrich von Wieser. He subsequently spent a short period in the United States and then returned to Vienna where he worked with and was influenced by Ludwig von Mises. Hayek in his earlier years was sympathetic to moderate Fabian socialism. Von Mises's criticism of the feasibility of socialism in his article on the problems of economic calculation under socialism, and in his large critical book *Socialism*, made a significant impact on Hayek. While Hayek was not fully in agreement with von Mises's arguments, he found himself becoming increasingly drawn to his conclusions.

Hayek was recruited to the London School of Economics (LSE) in 1931, where he and Lionel Robbins formed the core of a group interested in distinctive approaches to the understanding of capital and the trade cycle. They drew on the Austrian tradition and on the work of Swedish economist

Knud Wicksell. However, almost all of those who had been close to Hayek gradually moved away from him under the impact of John Maynard Keynes.

During the 1930s, Hayek was critical—as was Robbins—of the kind of inductivist, empiricist approaches to economics that were popular and were pressed on them by William Beveridge, the director of the LSE. Hayek diagnosed these ideas as influenced by a tendency to uncritically imitate what were claimed to be the methods of the natural sciences and saw them as interconnected to the methodological ideas of the younger German historical school of economics. He had a strong aversion to this approach, as it seemed to him to deprive economic theory of the important role of indicating constraints on social reform. Hayek discussed these issues in his inaugural address at the LSE and was led into wider issues in social theory and the methodology of social science. He gradually formed plans for a critical study of the history, intellectual faults, and likely consequences, of the ideas of which he was critical in a project (“The Abuse of Reason”) on which he worked in the latter part of the 1930s and in the early 1940s. To pursue this line of study, he largely turned his back on his earlier work in economics, work that had run into technical difficulties.

This earlier work on economics was in the tradition of general equilibrium theory and tried to deal with money in such a context and to discuss trade cycles. Hayek was led, however, by his reflections on problems of economic calculation under socialism, to place stress on the way in which markets coordinate knowledge that is socially scattered and not available to the would-be central planner. Further, drawing in part on Michael Polanyi’s parallel arguments against planning in science, Hayek stressed the way in which some knowledge that was tacit, and could not be articulated, could be fed into decision making in a market economy.

Major Works on Political and Social Themes

Hayek turned increasingly to work on social and political themes. His *Road to Serfdom*—which was written as a popularization of ideas that he had intended to treat in more detail as part of his larger project—caused a stir when it was published in 1944. It is best read as an argument that calls for

economic planning, or the continuation of wartime planning into peacetime, and was liable to have the unintended consequence of putting people's freedom in jeopardy, of undermining democracy, and of having an adverse effect on the economy and could thus at least inadvertently promote totalitarianism. Hayek did not spell out his more positive views in detail, but some things were clear. His work represented a defense of classical liberalism and a so-called *Rechtsstaat* view of the rule of law (close to that of modern republicans such as Philip Pettit). However, he also favored a safety-net conception of a welfare state and favored various other kinds of (limited) governmental intervention in the economy and society more generally. His concern was that such measures—and other social goals—should be pursued in ways that would not lead to the dire consequences that he thought would eventuate from contemporary calls for planning.

Hayek's book received a good, but not uncritical, reception in Britain. However, a popularization in the *Readers' Digest* and its mass dissemination led to *The Road to Serfdom*'s being the topic of considerable controversy in the United States. In Britain, the popularized version made a strong personal impact on Antony Fisher, who was to go on to found Britain's Institute of Economic Affairs, and on a network of free-market think tanks across the world. Keynes, whom Hayek had got to know well while the LSE was in wartime exile in Cambridge, responded in a friendly way to the book, but teased Hayek by saying that the interventionist aspects of his own views were in danger of placing him on the road to serfdom. Some of Hayek's later work in political theory offers a response to this problem.

Before we turn to this work, however, it is important to note that while one feature of Hayek's *Road to Serfdom* was that he embraced the idea of critically improving our inherited institutions (a theme that he was later to relate to Karl Popper's critical rationalism), there were also two themes in his "Abuse of Reason" project that contrasted with this idea. The first is that we may inherit social institutions that are not consciously designed, and that perform important social functions the existence and character of which we may not properly recognize. Hayek, in works that formed part of this project, seemed to suggest that we needed to be concerned about damaging such things, and these ideas sometimes led him in antirationalist and

conservative directions. Second, when he reflected on the methodology of social science, he drew on some ideas about psychology that he had developed as a student as a result of reflections on the work of Ernst Mach. These reflections he was later to write up as his *Sensory Order*, and they may also be related to his later ideas on methodology and in social theory, about the significance of rules that are unconsciously followed, both for society and as imposing limitations on our understanding. All this made for an interesting but not always coherent mixture, which was later added to by his development of evolutionary themes in which he pictured rules and certain social orders as having come about because they helped people to thrive and more importantly, to stay alive, but which people typically did not understand and which might often be in tension with their more explicit moral ideas. It was interesting to find that while Hayek explained in “Why I Am Not a Conservative,” an appendix to his *Constitution of Liberty*, Hayek’s old friend Lionel Robbins dissented strongly from what might be called the more conservative and antirationalistic aspects of Hayek’s ideas when he reviewed that work.

The Constitution of Liberty was written in the United States, where Hayek had moved for personal reasons. He was employed at the Committee on Social Thought at the University of Chicago. While there, he explored his ideas in wide-ranging seminars, which also involved a number of distinguished Chicago faculty and which led to a stream of interesting work in methodology, social theory, and the history of ideas. His *Constitution of Liberty* aimed to restate, in an explicit form, the classical liberal ideas to which he was attached. It is illustrated by copious references to the history of this tradition and offered that positive statement of his own views on policy issues that some critics of his *Road to Serfdom* had diagnosed as missing from that work. *The Constitution* did not receive the attention that Hayek had hoped for from political theorists, and Antony Quinton probably expressed a then widespread view when he referred to Hayek as a dinosaur (albeit a magnificent one). Some of his policy proposals seemed to be more restrictive than his general theoretical approach would warrant, and there were problems about how his view of liberty was to be interpreted. A key difficulty was that a central idea in his work seemed to be a formalist view of the universality of law, in the tradition of Jean-Jacques Rousseau and Immanuel Kant. But as Hayek himself admitted, it was not clear that this

could really secure individual freedom, and his response to this problem did not seem clear-cut.

In response to rules for retirement at a fixed age in Chicago, Hayek returned to Europe—to Freiburg, to Salzburg, and then to Freiburg. During this period, he produced a trilogy, *Law, Legislation, and Liberty*, and his *Fatal Conceit* (notably after his receipt of a joint Nobel Prize in economics in 1974, as a plethora of policy proposals, including for the “Denationalization of Money”). The former of these started out as a planned pamphlet. In this pamphlet, under the impact of Bruno Leoni’s raising problems about the model of the rule of law as a product of legislation with which Hayek had been implicitly working until this point (relating to the difficulties posed by modern, active legislatures for the stability of the law), Hayek attempted to recast his legal ideas as a reinterpretation of the common law tradition. The volumes contain a lot that is interesting, including some ideas for a new upper house of a legislative body. They would seem, however, to be more suggestive than something that works as a complete whole. *The Fatal Conceit* stemmed from a wish by Hayek to document his case against socialism—interpreted in the most general of ways. While it, again, contains some interesting ideas, Hayek was working on it during a period in which his powers were failing. W. W. Bartley III, whom Hayek had asked to be his biographer and the editor of his *Collected Works*, subsequently edited the volume heavily. With Hayek’s agreement, he included the extensive cutting of repetition (at Hayek’s request) and a reordering of material. Although the overall result, on Hayek’s own account, does not misrepresent Hayek’s ideas, it does not read like Hayek’s work. In addition, the volume as edited offers a resolution between the critical rationalist and antirationalist aspects of Hayek’s thought that may be more Popperian than Hayek would have been completely happy with.

Conclusion

Hayek’s writings are interesting and powerful and give the lie to the idea that it required John Rawls to reinvent political philosophy in the late twentieth century. Some aspects of his work seem of lasting importance—in particular, what might be called his concern for the structural constraints imposed on what we can accomplish politically by the functional

requirements of a market economy and legal arrangements needed to secure individual liberty. Some other issues were not successful; in particular, as he became older, his devotion to a hard line in classical liberalism became stronger, but it was not clear that he offered arguments against the possibility of what one might call a market-wise but generous welfare state. Also, the evolutionary themes in his work, while attempting to address an important problem, do not seem a success. There is much else that is important but requires further work—such as the potential opened up by his criticisms of the ideal of social justice because of the characteristics of a working market economy and his stress on the role of unplanned institutions and the problems of their piecemeal improvement. In a strange sense, while some of his ideas have made an important impact on socialists such as Lord Plant, David Miller, and Andrew Gamble and while some of his arguments were reinvented by Alec Nove, the politicization of its reception—by enthusiasts and critics alike—has perhaps led to not as much being drawn from it as Hayek deserves.

Hegel, Georg Wilhelm Friedrich

Georg Wilhelm Friedrich Hegel (1770–1831) was a German philosopher whose concerns ranged over the full scope of human experience. The culmination of idealist philosophy beginning with Immanuel Kant and including Johann Gottlieb Fichte and Friedrich Wilhelm Joseph Schelling, his thought is one important origin of Marxist political thought. As one who was young during the French Revolution and lived during the dynamic development of capitalism, he sought to comprehend what those momentous events meant for Western political thought and practice. Throughout his philosophy, he argued for the centrality of freedom—though his critics frequently wondered whether his idea of freedom had any coherence to it. His major work of political philosophy is *The Philosophy of Right* (1821). His first important philosophical work, *The Phenomenology of Spirit* (1807), also contains many important political insights, as do his lectures on world history, published posthumously, and especially the introductory lectures, *Lectures on the Philosophy of World History: Introduction* (1975). He also published *The Science of Logic* (1816) and *The Encyclopedia* (1817; revised editions 1827 and 1830), a compendium or overview of his system; his heirs published his lecture series, compiled from students' notes, on world history, aesthetics, religion, and philosophy. His minor writings and other lecture series, including some on politics, have also been published, many only recently.

Biography

Hegel was born in 1770 in Stuttgart to rising middle-class parents who attended to his education. In 1788, he was sent to a Protestant seminary attached to the university in Tübingen, a few miles from Stuttgart, where he began friendships with Friedrich Hölderlin (the poet) and Schelling (soon to be professor of philosophy). Together they shared an enthusiasm for the French Revolution and heady discussions about politics and religion. After graduation in 1793, Hegel had short stints at many vocations. He was a tutor first in Bern and then in Frankfurt. In 1801, Schelling helped him obtain a post as an unsalaried tutor earning fees from students at the University of Jena, where he composed a series of draft systems of philosophy. In 1806, he saw Napoleon the day before his decisive victory over the Prussians at Jena, fathered an illegitimate child, and finished *The Phenomenology of Spirit*. The university in shambles, Hegel moved to Bamberg as a newspaper editor and to Nuremberg as a Gymnasium (a type of high school within the German educational system) headmaster.

After this checkered career in exciting times, Hegel, now married, moved to Heidelberg as professor of philosophy in 1816, and then in 1818, took up the prestigious chair of philosophy (formerly Johann Gottlieb Fichte's) at the University of Berlin. There he published *The Philosophy of Right* and new, expanded editions of the *Encyclopedia*, gave lecture courses, published some periodical essays analyzing the proposed English Reform Bill, and engaged to some extent in the politics of Prussia, sometimes supporting radical students (with little success), sometimes settling old academic scores (with mixed success). In the fall semester of 1831, during a cholera epidemic, Hegel died, probably of intestinal disease.

Hegel's Political Philosophy

Overview

Hegel saw his philosophy as a philosophy of freedom and the history of the world as the development of the consciousness of freedom, which Hegel called *Geist*, or spirit. In his political philosophy, he explores the mutual constitution of individuality and institutions. Neither free individuals nor rational institutions are causally prior; they both depend on each other for

their development and vitality. So Hegel focuses on political institutions and practices as the result of human free will, where the will is both thoughtful and active, generating and continually revitalizing institutions and practices that themselves educate and encourage the will to more complex and sophisticated determinations or institutions and practices of freedom. In other words, for Hegel, freedom is the development, enactment, and expression of a variety of human capabilities that constitute our individuality within a constitutional modern state whose institutions encourage and require the development of those capabilities and that individuality. The mutual and mutually reinforcing constitution of individuality and institutions is dynamic, vibrant, and harmonious. Modern individuality can exist only within the complex, variegated modern political order, within which the family encourages individuation, civil society includes areas for the pursuit of private interests and shared goods, and the political state unites everyone in general or universal goals. Conversely, these modern institutions—the loving (or sentimental) family, a semiautonomous civil society including free economic activity and the rule of law, and a neutral, active state—can only exist when individuals have a sense of themselves as subjects able to act in the world, engage themselves in multiple spheres of life, and are differentiated from other individuals in a society respectful of and recognizing differing personal interests, goals, and accomplishments.

Simply to assert these statements is to raise a multitude of questions, whose answers are complex and frequently contested. Some questions, such as the meanings of *rational* and *universal* when referring to institutions, will be explored below. To some other immediate questions, answers can be proffered. Hegel's view of individual freedom is very different from those who concentrate on freedom defined (synonymously) as choice, as the absence of coercion, or as what is frequently called negative liberty. Hegel does think that free individuals must have choice in many areas of life, especially in the economic order in civil society, but he thinks that individuals and society will flourish only if individuals are also educated, thoughtful, and social enough to make choices that lead to their own self-development and to the strengthening of modern institutions (and so Hegel devotes much of *The Philosophy of Right* to developing thoughtful, cultivated citizens). Hegel also thinks, though, that in some areas of life—

such as being a citizen of the modern state—individuals do not have a choice; for him, freedom lies not in consent or tacit consent, but in the citizen's insight that the state, acting for the public good, is worthy of support. (That formulation, of course, assumes or requires that the modern state be well organized and that the citizen's comprehension be well-enough developed to see that organization.)

Hegel tries to avoid being either a communitarian (like Jean-Jacques Rousseau or Edmund Burke) or an individualist (like Thomas Hobbes or John Locke); he wishes to combine universal communities with complex individualities. Hegel wishes to avoid the liberal formulation, standard since Locke, that sees that the more power the state has, the less free the individual is. Rather, for Hegel the state needs to be powerful enough to act in the common good, but the state has that power (and the ability to discern the common good) only when individuals are free, educated, and active—and therefore, Hegel thinks, able to discern that they need the state to pursue the common good and structure major social and economic institutions so that they increase freedom.

Some who think Hegel does not integrate individuals and institutions well see him as authoritarian, a point of view common in English-language interpretations written under the influence of World War I and II and totalitarianism but also triggered by some of Hegel's more extreme praise of the state. Like Hobbes, he assimilates the state to God; he also insists on the rationality of the state. Also like Hobbes, Hegel has many interpreters who see beyond those statements to the emphasis on individual freedom, subjectivity, and activity.

Others see Hegel as conservative, a kind of Burke dressed in the wardrobe of rationality rather than in tradition and history. In one sense, this interpretation is compelling. Hegel's approach to political philosophy is, as in so many cases, idiosyncratic. For Hegel, the goal of political philosophy is not to imagine or construct a state as it ought to be, but to comprehend the present political order, its coherence and its value. In his famous words from the "Preface" to *The Philosophy of Right*, he writes,

Whatever happens, every individual is a child of his time; so philosophy too is its own time apprehended in thoughts. . . . To recognize reason as the rose in the cross of the present and thereby to enjoy the present, this is the rational insight which reconciles us to the actual. . . . What is rational is actual and what is actual is rational.

Here, Hegel distinguishes “the actual” from “the real.” The real is more or less everything that exists in its empirical richness and diversity; the actual consists of the institutions and practices that are central to Hegel’s vision of the modern state and of individual freedom within that state.

Recognizing that Hegel is in one sense conservative or accepting of the present, other commentators note that he differs radically from Burke, partly because for Hegel an institution needs to be justified by reason, not merely tradition, and partly because Hegel incorporates the ideals of the French Revolution and the practices of modern political economy into his political thought.

Hegel’s emphasis on comprehending the present is crucial to Karl Marx, who adopts that principle for his communism; Marx wishes to examine capitalism to find its internal contradictions and possible future (revolutionary) directions rather than simply posit a communist condition that ought to exist.

Two Hegelian terms need further clarification. For Hegel, universal can encompass various scopes of generality. The rights of man are universal because all people can claim them (although outside of Europe, not all people’s rights are actualized). A state is universal because it takes into account all its citizens. In a contract, universality appears as the common will of the contract, what the two parties agree on. Hegel is concerned to see universality in many different forms and scope because he is concerned to develop universality or communities (at the same time that he develops varieties of individuality).

Hegel is certainly not the first, or the only, political philosopher who claims that the institutions he presents are rational. But rationality in Hegel carries many meanings. At its most philosophical, reason or rationality is the self-

determination of concepts, so reason involves the autonomous self-movement and self-development of concepts from the most basic or simple (like sense perception, in *The Phenomenology*, or bare being, in *The Logic*) to the most complex, absolute knowing. In Hegel's political philosophy, reason also involves the self-movement of concepts as well as their actualization in practice (the actual, not the real)—a process also described as dialectical.

For instance, when Hegel discusses abstract right (similar to Locke's natural rights in the state of nature), he reduces the scene to the bare minimum required (a person's will and a thing) and then develops and fills out what abstract right entails and includes. As he enriches his presentation, he eventually reaches a point where right is in conflict with itself or poses a problem that it cannot solve on its own terms; in order for the problem to be resolved, a standpoint different from abstract right must be introduced—and for Hegel's dialectic, that new standpoint must grow out of the terms of abstract right's problem itself.

When that dialectic plays out in the institutions and practices of the modern state, it produces a rational state—a state whose institutions and practices are connected by dialectical logic. What is striking about Hegel's rational state is the variety of types of institutions and practices it contains.

Hobbes's logic—or John Rawls's or Robert Nozick's—is monochromatic: it moves in a straight line from presuppositions to conclusions. Hegel's dialectic logic allows, indeed requires, movements to new and different standpoints, institutions, or practices. So Hegel's rationality is variegated, a coat of many colors—and so Hegel's state contains institutions based on different principles and encouraging different dimensions of individual development.

Rights and Morality

The Philosophy of Right is divided into three parts: “Abstract Right,” “Morality,” and “Ethical Life,” which comprises more than half the text and is itself divided into “Family,” “Civil Society,” and “State.” In the “State,”

Hegel treats not only “Constitutional Law,” but also “International Law” and “World History.”

Hegel begins the substance of *The Philosophy of Right* with a discussion of “Abstract Right,” mentioned above. For Hegel, the people put their will into a thing and make it their property: this is the form of the right to property. From that, Hegel derives the right to life and liberty, as people put their will into their mind and body, making them theirs (and so gain control over the contents of their mind and actions of their body). Hegel develops abstract right further by multiplying property-owning persons, who can then contract with each other in free contracts. But exchanges can also involve wrong, if force or fraud is used. Hegel then discusses punishment, the righting of wrong by punishing the person.

What Hegel has done, in other words, is to generate the person’s rights to life, liberty, property, and free exchange—the traditional rights of human beings. He has also discussed and justified punishment. But with Hegel, as with Locke, punishment cannot be ensured in a world of personal rights. So Locke jumps to the state. But Hegel explores punishment more and sees that wrong and punishment are not concerned only with my or your rights, but with the universal right in general, and persons ought to do what is universally right. That formulation, however, moves (dialectically) beyond the standpoint of rights to the standpoint of (Kantian) morality, where each person ought to will the universal.

So in the second part, “Morality,” Hegel discusses and modifies Kantian morality. Throughout, the problem for the moral subject, as a particular being, is how to discover, define, and act on a universal moral principle. Hegel stresses both the (Kantian) universal principle and the particularity of the subject. As a particular being, the subject has, Hegel thinks, the right to be satisfied—to live in and experience interactions and institutions that fulfill his or her particular subjectivity and goals. In the quest for the universal, however, the subject finds no definite content; here, as in *The Phenomenology*, Hegel criticizes Kantian morality on the grounds that Kantian universalizability generates consistency but nothing more. “Morality” as a standpoint fails because it cannot ensure the universal, but, for Hegel, the existence of human beings with abstract and moral rights

requires and demonstrates the existence of institutions and practices that generate such human beings. Those institutions and practices Hegel calls *Sittlichkeit*, or ethical life.

Sittlichkeit, or Ethical Life

Hegel's discussion of *Sittlichkeit*, or ethical life—the central political institutions of the modern world, family, civil society, and state—is striking in many ways, as Hegel reconceptualizes those institutions and indeed reconceptualizes political life as *Sittlichkeit*. Ethical life is the overcoming of the one-sidedness of abstract rights and of the noumenal categorical imperatives. Ethical life includes institutions in which people can actualize and live their rights and be moral because the institutions provide the determinacy (or actualization) absent in rights and morality.

Hegel includes civil society as a realm of ethical life separate and different from both state and family. Aristotle saw the polis and the household as the two central political organizations, and Hobbes and Locke talked about political or civil society. But Hegel separates civil society—the system of needs, the administration of justice, and the police or public authorities and corporations—from both household and state. This separation legitimates a space—civil society—where individuals can engage in the selfish pursuit of their own goals and at the same time, quarantines such selfish pursuits away from family and state.

By separating civil society, Hegel becomes one of the first political philosophers to confront and accommodate the insights of modern political economy, the ideas of Adam Smith and David Ricardo. Hegel also recognizes that the modern economic order cannot be autonomous but requires guidance from the public authorities, who can provide public goods (like transportation infrastructure), mitigate systemic shocks that cause price spikes, and alleviate other market shortcomings. Hegel is acutely aware of a serious and ongoing limit of civil society: the workings of a generally free economic order generate a class of poverty-stricken individuals, a rabble of paupers, whose poverty is not their fault. Rather, formally equal contracts result in substantively unequal distributions of wealth and resources, an inequality exacerbated by technological progress

and an intensified division of labor. Hegel cannot discern a successful means for the modern state to resolve the problem of poverty other than to suggest sending the surplus populations overseas to found colonies.

Because civil society is a separate sphere of activities and institutions, Hegel can conceptualize the family as a loving or sentimental family, not exclusively a contract (as in Hobbes, Locke, and Kant) nor the locus of producing and consuming goods (as in Aristotle's household). For Hegel, marriage is an institution to supersede contractual attitudes with mutual feelings of love and affection both between spouses and for children.

Hegel can also reconceptualize the state. By placing love and family ties in the family and economic attitudes and legalistic approaches in civil society, Hegel can interpret the state as the institution that pursues the universal good of the community as a whole. A family has only a partial and narrow perspective; actors in civil society think in terms of their own private goods; only the state has a perspective broad enough to allow it to determine the overall goals of and policies for the community. The state is knowledgeable, neutral among competing groups and interests, and active in the pursuit of the public good.

Hegel's treatment of the state's constitution differs somewhat from the U.S. idea of the division of powers, with president, legislature, and court. Hegel talks of a monarch, legislature, and executive (having placed the administration of justice in civil society). The executive branch or the bureaucracy learns about and administers the society. The legislature passes laws. The monarch provides a point of ultimate decision, although scholars disagree about the monarch's power and initiative. In any event, Hegel sees the hereditary monarch as providing a moment of subjectivity and of the natural amid the civilization of the modern state. (As an important aside, to look at Hegel's political philosophy thematically allows one to see, for instance, that each of the major institutions of ethical life retains a moment or aspect of nature, no matter how civilized or rational Hegel's ethical life may be—or, to be more precise, for Hegel's politics, civilization and rationality must always include an aspect of the natural: sexual relations and feelings in the family, working on nature and natural products in the system of needs, and in the state the monarch by birth and the upper house of the

legislature, composed of land-owners whose livelihood depends on the land they work.)

When Hegel talks of international relations, some interpreters think he adopts a stance between Hobbes's ideal of sovereign, autonomous states that can arbitrarily make and break treaties and Kant's insistence on a cosmopolitanism that ought to be and that is a universal ethical obligation. Hegel rejects Kant's cosmopolitanisms as he rejects Kantian morality: an ought-to-be that lacks content, determinacy, and hence existence in the world. But Hegel also rejects Hobbesian autonomous sovereignty, because he sees that a modern state depends on other states for relations, recognition, and legitimation. Consequently, states develop norms of cooperation and share the universalist standards of rights and the universal practices of trade and commerce in civil society. So Hegel sees that international relations includes states' developing toward shared norms and reciprocal recognition. (By looking to what is actual, to what is happening in the present, Hegel is able to reject Hobbesian autonomous sovereignty, recognize cosmopolitanism only as an ought, but still see how states develop reciprocal linkages and shared norms—whether Hegel is conservative or not, his attention to the actual liberates him, he thinks, from the one-sidedness of normative arguments.)

Hegel also considers world history. Here Hegel propounds a metanarrative, encompassing all of human history as the story of the progress of the consciousness of freedom. (Recently, noting the anomalous place of Egypt and the general ignoring of Africa, some critical commentators have raised questions of Hegel's inclusiveness and possible racism.) The progressive embodiment of freedom now rests with European states, for whom "all are free," unlike for instance Rome, where only citizens were free and only as legal subjects. Some see Hegel as ending history with Europe; others see that he ends history only on methodological grounds (philosophy cannot treat the future or what ought to be), and that he certainly imagines future developments of human freedom.

Politics in The Phenomenology of Spirit

Throughout his works, Hegel keeps politics in mind. But some famous passages and themes in the *Phenomenology* seem particularly important to Hegel's political philosophy. In the section on "the moral view of the world," Hegel criticizes Kantian morality in ways similar to the treatment in *The Philosophy of Right*, as described above. In the famous "master-slave" or "lordship and bondage" section Hegel introduces a number of politically important considerations. Central to the masterslave dialectic is recognition. Two self-consciousnesses face each other and struggle to overcome the other. Finally, in defeat one accedes to being a slave, and the other becomes a master. But when each seeks recognition in the other, their inequality means that their recognition and their relations are unstable and partial. Only in the modern state, Hegel thinks, is equal recognition actualized and each citizen free and equal because each recognizes other citizens as free and is recognized by them as free. The true equality of citizens in the state is the equal recognition of each other's humanity and freedom, "the I that is a We, and the We that is an I," as Hegel introduces his discussion. This concern with recognition is one of the ongoing themes of contemporary Hegelian political thinkers, such as Axel Honneth.

Hegel also discusses work in the master-slave section. Work is not just a means to satisfy needs. In work, nature is grasped and transformed to conform to human wishes. The working human being is also liberated from his own natural being and desires. At the simplest level, to labor is to restrain and check desires and thus to liberate human beings from the domination of desire. Because the worker creates tools and methods to shape nature, work produces artifacts, and so new possibilities for both needs and work. Tools and work methods are social, so social work and needs develop. The human liberation from natural desires and needs is for Hegel but a first step in the human struggle to transform the natural and the singular into a second nature that is intellectual and social. Hegel articulates the developmental or civilizing process of work and needs.

Another politically crucial section is "absolute freedom and terror," which refers to the Reign of Terror during the French Revolution. For Hegel, the revolutionaries turned to terror because of their abstract thinking, their commitment to the universal goals of liberty and equality. But their commitment to universality meant that they could not undertake any

constructive activity, because to construct is to create differentiation, difference, and inequality. So all they could do was to destroy—to wipe out differentiation wherever they found it. Hegel concludes that universal goals are, and must be seen as, actualizable only through differentiated, determinate institutions and activities.

Influence

Hegel's political philosophy influenced Ludwig Feuerbach, Marx, and Engels as they struggled against its imposing systemic structure. For most of the rest of the nineteenth century, Hegel was—as Marx said in a preface to *Capital*—a dead dog, except among some British idealists such as T. H. Green. In the 1920s and 1930s, György Lukács and the Frankfurt school (including Herbert Marcuse and Max Horkheimer) used Hegelian insights to help generate a critical theory for an age where dialectical materialism as enforced by the Soviet Union had produced a sclerotic Marxism; with Hegel's ideas they could think of ideology and history, for instance, in much richer ways than the official Soviet line allowed. A revival of Hegel scholarship in the United States and in the United Kingdom occurred around 1970 and has continued through the present, and postmodern thinkers such as Michel Foucault, Jacques Derrida, and Slavoj Žižek find themselves confronting and transforming Hegel at many turns.

Hegelianism

Hegelianism is a philosophical movement launched by students of Georg Wilhelm Friedrich Hegel (1770–1831), who taught at the University of Berlin from 1818 until his death. Hegel's philosophy was enormously influential in the German territories until the defeat of the Revolutions of 1848, when it underwent an eclipse until the latter years of the nineteenth century. Revived by the British idealists, it was also adapted by other theoretical traditions, including Marxism, existentialism, and twentieth-century communitarianism, which focus on its political and ethical dimensions. Its theoretical dimensions, especially the relation to Immanuel Kant and to analytical philosophy, have also been subject to recent reexamination so that it is proper to speak of a revival of Hegelianism in contemporary thought.

Hegel builds on the philosophy of Kant and Johann Gottlieb Fichte to develop a new, historical conception of reason. The core of Hegel's idealism is the unity of thought and being. This philosophy does not imply that reality consists only of ideas. It means, rather, that reason or thought has a causal force, that it is capable of changing the objective world, or of realizing itself. Freedom for Hegel means recognizing oneself in an other. This recognition can occur in mutual interaction with other subjects, confirming our freedom, or it can mean that we recognize ourselves as reflected in the objective world as we refashion it in light of our ideas. Hegel explains in his *Phenomenology of Spirit* that the social world is made up of changing configurations of relationships, each of which expresses a

particular understanding of reason and freedom. Each of these relationships is also burdened with specific contradictions or limitations, which require a revision both of the standards of rationality and of the ways in which reason is manifest. What is the status of the modern world in this schema?

Hegelianism represents the development and critique of Hegel's project of examining the realization of reason in the modern world.

In his *Philosophy of Right*, Hegel was describing this unity of thought and being at the heart of his philosophy when he asserted that the real is rational, and the rational is real. This claim is not a simple apology for the existing order, as it is sometimes interpreted, but expresses a confidence in the power of reason to achieve greater mastery over objective conditions that hamper autonomy. Modern freedom is manifested in the figure of the free and infinite personality, which combines increasing economic differentiation and needs, with the reflexive unity provided by citizenship in a rationally ordered state. For Hegel, modernity is, however, a problematic configuration of social life: it gives an unprecedented scope to subjective freedom, compatible with coexistence in rationally justified public institutions, but it is also a culture of diremption or alienation, in which private interest threatens to overwhelm the integrative capacities of these institutions. More specifically at issue was the assessment of the Prussian state, which after a period of political and economic reform under the pressures of the French Revolution and Napoleon, had proven resistant to further modernization. After Hegel's death, his school fractured over the evaluation of modern political, social, and religious institutions, especially in the German states, and the degree to which they adequately incarnated freedom.

The Hegelian school was always a very loose association of philosophers, theologians, and political thinkers comprised of shifting political and geographic alliances. United initially by a project of publishing Hegel's Berlin courses in aesthetics, religion, history, and so on, members of the school edited eighteen volumes of lectures, of varying reliability, between 1832 and 1845. Disagreements among Hegel's students over the interpretation of his philosophy were summarized in 1837 by David Friedrich Strauss (1808–74) as a distinction among Hegelians of the Right, who stressed the compatibility of Hegel's philosophy with orthodox

Christianity; the Left, who reformulated Christian doctrines; and the Center, indecisively straddling both camps. These labels quickly assumed wider political meanings. Right Hegelians advocated accommodation with existing political authorities (though most continued to seek reforms). The Left or Young Hegelians adopted more radical conclusions, reflecting on the effects of the French Revolution and the end of the old social order of estates. The Hegelians were quickly embroiled in political contestation in the *Vormärz*, the period from the late 1830s until the German Revolutions of March 1848.

Reviving charges that had been made against German philosophers in the eighteenth century, conservatives in the 1830s accused Hegel of pantheism, or of equating the divine with nature, implicitly denying a personal God. The conservatives stressed instead the separateness of God from the world, with Christ as the unique mediator between the human and the divine. They conceived the monarch to play a similar mediating role in the political realm, as uniquely endowed with sovereignty. In response, the Right Hegelians defended Hegel's religious orthodoxy, while the Hegelian Left initiated a critique of religion and its political applications.

In the late 1830s, these conservative attacks on Hegelianism sharpened under the sponsorship of the Crown Prince of Prussia, who succeeded to the throne as Friedrich Wilhelm IV in 1840. Viewing Hegelianism as subversive of political order and established religion, he purged Hegelian and other reforming influences from the state and the universities and promoted antirationalist pietist theologians and Romantic philosophers, such as Friedrich Wilhelm Joseph Schelling, who was recalled to Berlin expressly to combat Hegelianism. In these circumstances, the Hegelian Left undertook the further development of the Hegelian system and the defense of the Enlightenment with its heritage of rational critique and emancipation from hierarchical social relationships. Hegel had synthesized Enlightenment sources in his own system; his students sought to think these sources through again, often challenging Hegel's own expressed conclusions.

The Hegelian Right tended to stress Hegel's orthodox religious views and his accommodation to existing political realities. Rejecting the criticisms of Hegel as a pantheist, Philipp Marheineke (1780–1846), first editor of

Hegel's Berlin lectures on religion, and Carl Friedrich Göschel (1784–1861) argued that Hegel's philosophy was compatible with Christian theological ideas on the personal immortality of the soul, the divinity of Christ, and the personhood of God. The Right Hegelians also stressed Hegel's affirmative relation to existing political authorities, while generally favoring gradual reforms. In his 1853 *Philosophy of the Ugly*, Carl Rosenkranz (1805–79), often associated with the Hegelian Right, developed Hegel's aesthetic ideas. He explained the role of the ugly in modern art, in contrast to classical conceptions of beauty, as related to the fundamental experiences of disharmony in social life, and he depicted comedy as a liberation from ugliness and from the commonplace in the modern world.

In defense of a more radical approach to politics, religion, society, and art, the Hegelian Left redefined important elements of Hegel's philosophical system. One such concept is the idea of spirit. For Hegel, *objective* spirit refers to the historically developing forms of freedom, crystallized in social and political institutions, and in different conceptions of personhood. *Absolute* spirit condenses these understandings in artistic depictions, religious representations, and philosophical systems. The Left Hegelians contested interpretations of spirit proposed by the Hegelian Right as involving the activities of a divine being or transcendent force, operating through human agency. The Left defined spirit as the immanent historical processes of individual and social emancipation and self-formation, propelled by contradiction and struggle. Absolute spirit too was reconfigured from its canonical ordering by Hegel, for whom philosophy was closer to religion than to art, differing in form but not content. For the Left Hegelians by 1840, religion was viewed as a form of alienated spirit, or as a spirit unaware of its own activity, whereas art was taken to demonstrate the effectiveness of reason in reshaping the material world. Sharing this active and creative relation to the objective order, art was thus elevated above religion in the hierarchy of the absolute. Religious alienation was conceived by Ludwig Feuerbach (1804–72) as the projection of human species characteristics into a fetishistic divine being and by Bruno Bauer (1809–82) and the young Karl Marx (1818–83) as an imaginary compensation for deficiencies of earthly life. While Enlightenment theorists had criticized religion as an instrument of power, the Left Hegelians tended

to see it as a necessary though transient historical stage through which consciousness must pass on its road to emancipation and self-clarity.

In rethinking the forms of objective spirit and completing the Enlightenment project, new ideas of freedom and community emerged. As Bauer presents the issue, the Hegelian heritage splits along two axes, the Fichtean and the Spinozist (after Dutch-Jewish philosopher Baruch Spinoza, 1632–77), which Hegel himself had attempted to synthesize. These two axes stress respectively individuality and collectivity. Bauer's own Fichtean reading emphasized principles of autonomy, or the conscious, individual enactment of universal interests. The alternate, Spinozist route from Hegel, followed by D. F. Strauss and Feuerbach, leads to the affirmation of universality as community or shared interests, while placing less emphasis on the element of individual willing. In Feuerbach and Marx, it leads to the idea of a collective species-being, damaged by particularistic and egoistic activities, but potentially retrievable through changes in social relationships. Both the Fichtean and the Spinozist reading of Hegel stress the importance of universality, a general will that transcends immediate interests and desires. Alienation and isolating egoism in modern social life were addressed, in opposing directions, by Feuerbach, who stressed solidarity, and Max Stirner (1806–56), who stressed disengagement.

The attack upon privilege and hierarchy, the democratization of the state and the achievement of a republic of self-consciousness based upon the recognition of universal interests, animated the works of the leading Hegelian theorists such as Bauer, and Arnold Ruge (1802–80). These authors criticized Hegel's position in his *Philosophy of Right* as an unacceptable compromise between the diametrically opposed principles of monarchic and popular sovereignty. Bauer also criticized the hierarchical order of estates that had characterized pre-revolutionary Europe, and with important reservations, he endorsed the Jacobin position in the French Revolution.

The fulfillment of the Enlightenment program of emancipation also meant confronting unprecedented social and economic problems. For the Hegelian Left, the incomplete rationality of modern society assumed an especially acute form with the emergence of the social question, the rise of capitalism,

and the appearance of new forms of urban industrial poverty. Eduard Gans (1797–1839) described the concentration of economic power as the decisive problem impeding further progress in freedom. Revising Hegel's account of poverty in the *Philosophy of Right*, Gans drew on French social thought such as Saint-Simon's ideas of association (a precursor to modern trade unionism) to argue that the combined power of wageworkers could offset the monopolistic bargaining position of capital owners and lead to a more equitable distribution of wealth, yet he repudiated socialist ideas of collective property as inimical to freedom and individuality. Gans made ideas of opposition, struggle, and social exclusion central to Left Hegelian understandings of progress toward a more rational society. Despite deep-seated political differences, Bauer, Ruge, and the young Marx shared this perspective.

In his 1843 critique of Hegel's *Philosophy of Right*, Marx contrasts the rigid formalism of political life to the concrete dynamics of civil society and shows how atomism in social relations corresponds to the abstract and fetishistic character of the state. Marx thus breaks with Left Hegelian republicanism and moves toward a socialist position that requires the abolition of private property in the means of production as the solution to the problem of alienation and exploitation in the modern world. For Marx (at least by 1843), a mere reform of political institutions would leave the underlying economic causes of alienation untouched. Together with Feuerbach, Marx holds that the development of certain capabilities is of intrinsic and not merely instrumental value. For Marx, these include not only basic physical needs, but also intellectual and cultural development, the possibility of fulfilling forms of labor, and membership in community. Marx's early texts combine the idea of a substantive good reminiscent of Aristotle with Kantian ideas of freedom and self-determination. The emancipation of labor would mean the attainment of autonomy, whose institutional form would, on this reading, be a version of socialism.

Hegelian thought tended to fall into disrepute with the failure of the European revolutions of 1848 and with the rise of positivism in the later nineteenth century. Versions of it remained important, however, in the development of Marxism, which considered itself an inverted or upright Hegelianism divested of idealist metaphysics, but retaining a dialectical and

historical method, and a distinction between essence and appearance (between labor and its manifestations in politics, culture, religion, etc.). Hegel was also the most important reference for British idealism, as represented by T. H. Green (1836–82), Edward Caird (1835–1908), and F. H. Bradley (1846–1924), who contested the atomistic conception of the self typical of modern liberalism, a self divorced from its vivifying social context. They developed ideas of social connectedness and an ethic of conscientiousness and responsibility. Drawing themes from Hegel, contemporary political thinkers such as Charles Taylor object to the disembodied nature of the liberal subject or the reduction of social relations to merely instrumental value. This position is frequently associated with communitarianism, as opposed to contemporary liberalism, which with John Rawls is more closely linked with Kant.

At the turn of the twentieth century, analytical philosophy emerged in the works of Bertrand Russell (1872–1970) and G. E. Moore (1873–1958) as a protest against British Hegelianism, though contemporary work in analytical philosophy (Robert Brandom, John McDowell) is reviving interest in Hegel's contributions in logic and epistemology, rethinking the intuition-concept relationship that is fundamental to modern Hegel research. Important new theoretical developments see Hegel as much closer to Kant, completing and correcting the latter's critical program rather than abandoning it. The emerging political implications of this research are to challenge the identification of Hegelianism and communitarianism.

Hegelian influence has been pervasive in twentieth-century continental philosophy. Existentialism, especially that of Jean-Paul Sartre (1905–80), takes up themes from Fichte and Hegel to devise a theory of freedom and individuality in the modern world devoid of essential or given truths. The hermeneutics of Wilhelm Dilthey (1833–1911) and H.-G. Gadamer combine Hegelian influences with those of naturalism and psychologism, and of Heidegger, respectively. French postmodernism (Michel Foucault, Jacques Derrida, Gilles Deleuze) is a kind of anti-Hegelianism that criticizes what it sees as the holism of Hegel's dialectic and its alleged reduction of difference to sameness or uniformity; this claim is often associated with skepticism toward ideas of universality that Hegel defends. Originating in the works of Theodor W. Adorno (1903–69) and Max

Horkheimer (1895–1973), contemporary critical theory (Jürgen Habermas, Axel Honneth) retains the idea of universal interests and develops Hegelian themes of intersubjectivity and mutual recognition as ethical features of the modern world. These thinkers undertake the critique of modern alienation and of instrumental reason in the name of a fuller conception of rationality and freedom and a new ethic of intersubjective recognition.

In its many manifestations, Hegelianism remains a defining feature of the contemporary intellectual and political landscape. Critically engaging with Hegel's thought, and debating with religious and political adversaries in the 1830s and 1840s, members of his school sharply posed questions of freedom, personality, and modernity, whose urgency remains undiminished. Contemporary variants of Hegelianism continue to pursue this agenda in metaphysics, epistemology, ethics, and political thought.

Heidegger, Martin

Born in Messkirch, Baden-Württemberg, in 1889, Martin Heidegger studied Catholic theology and later philosophy at Freiburg University under the guidance of Edmund Husserl, the founder of phenomenology. After teaching at Freiburg and Marburg, he became professor of philosophy at Freiburg in 1928. He died in Messkirch in 1976.

His greatest work, *Being and Time* (1927, translated 1962), asked the question “What is being?” and answered it by analyzing the being of human beings or *Dasein* (literally, being-there), the only entities that interpret themselves and decide on their own being. *Dasein*’s being is existence (in its root sense of stepping forth) or being-in-the-world. People are thrown along with others into a world comprising interrelated objects of use against the background of nature. Our being is temporal. Not confined to the present, we look back to the past and ahead to the future. Temporality opens up the world: we are not focused exclusively on the object of our present attention, but are aware of entities encountered in the past and available in the future. Our normal condition is “inauthenticity”: People do what others do rather than making up their own minds. But looking ahead to their death in “anxiety” and “resoluteness” extricates them from the others into “authenticity.” Temporality enables us to have a significant history. Authentic historical action is not simply an individual matter: *Dasein* acts “in and with its ‘generation.’”

Later, under the influence of Friedrich Nietzsche, Oswald Spengler, and Ernst Jünger, Heidegger argued that not only Dasein but also being itself has a history. The way in which entities reveal themselves varies from epoch to epoch. The modern conception of being is an intensification of the Greek view of being as being produced. This conception underlies technology and the corresponding calculating, utilitarian worldview. Both America and the Soviet Union were, for Heidegger, bastions of technology, treating the whole world, including humans, as a standing reserve.

In 1933, Heidegger joined the Nazi party and was elected rector of Freiburg University. His rectoral address endorsed the new regime and its plans for reform of universities, but was conspicuously free of anti-Semitism. As rector, he applied Nazi policies but moderated some of the excesses of Nazism, refusing, for example, to dismiss two Jewish professors—professedly to protect Germany's international reputation, but since he could hardly have given any other reason, his motive remains in doubt. He resigned as rector in April 1934 and withdrew from political activity. He did not withdraw his support for Nazism and did not perform the dangerous act of resigning from the Party. Later, he became disillusioned, regarding Nazism as an expression of technology rather than as its remedy. He continued to view it as an aspect of modernity, on a par with capitalism, factory farming, and the hydrogen bomb, rather than as a specifically German phenomenon. In 1945, on the grounds of his association with Nazism, he was forbidden to teach; in 1951, his teaching privileges were restored. At first privately, and later publicly, he continued to develop his ideas until his death.

Like many German philosophers, Heidegger aspired to philosophical leadership, imposing his ideas on the amorphous Nazi worldview. His Nazism was inspired primarily by hatred of technology, capitalism, and Bolshevism. *Being and Time* is relatively apolitical. It is compatible with Nazism (though not with biological anti-Semitism) in that it could provide reasons for supporting Nazism. But it might equally provide reasons for opposing Nazism, and other philosophical standpoints might supply equally good, though equally inconclusive, reasons for supporting Nazism. For example, Nazism attracted philosophers who affirmed objective ethical values (such as Bruno Bauch and Nicolai Hartmann) as well those (such as

Heidegger) who denied them. Heidegger eventually concluded that philosophy has no direct relevance to politics and cannot provide reliable guidance, either on political principles and policies or through the thickets of political infighting.

Although his views on technology have influenced the environmentalist movement, Heidegger offered no practical proposals for countering it. His remedy is art rather than recycling. Art provides a model of a nontechnological approach to things. It lets objects be as they are without manipulating or exploiting them. His influence has been immense, but less on politicians than on theologians (e.g., Karl Rahner, Rudolf Bultmann) and philosophers—Hans-Georg Gadamer, Herbert Marcuse, and Theodor Adorno in Germany, Jean-Paul Sartre, Maurice Merleau-Ponty, Michel Foucault, and Jacques Derrida in France.

Herder, Johann Gottfried

Herder, Johann Gottfried

Herder, Johann Gottfried

German philosopher Johann Gottfried von Herder (1744–1803) is the intellectual father of nineteenth-century romanticism. He was influential in anthropology, philosophy of language, aesthetics, philosophy of history, and in political philosophy. In his political philosophy, Herder develops an organic understanding of the political community, which he grounds in a nation. According to Herder, a nation (or a *Volk*, a people) is a cultural entity with a distinct character and a shared language. Herder believes that a nation's character is embodied in its language: members of the nation think according to the national language they speak. In his philosophy of language and philosophy of history, Herder argues at length that thought is dependent on language: we think in a manner inherited from our language. As such, the members of a people are intrinsically connected, like organs within a body or branches to a tree. Herder contrasts this intrinsic, organic connection with mechanical and multinational associations that can only maintain unity in an extrinsic and artificial way by enforcing it from above. Therefore, he puts forward the principle that national-linguistic communities should be states. This principle has become known as the essence of nationalism. For Herder, the natural state is a nation-state, a state with one national character and one language, and we should avoid mingling together different nations within a mechanical multinational state.

This nationalistic argument arouses suspicion today, but although Herder's sociological lens certainly did not allow for conceptualizing dual communal loyalties, bilingualism, or multinational democracies, all in all his

nationalism is moderate. The aura of narrow nationalism that sometimes surrounds his work does not originate from Herder's own theory but from Herder's reception, especially by nineteenth-century German nationalists who have argued on the basis of a Herderian background. To justly interpret Herder's nationalism, we need to take the following four features into account.

First, Herder's nationalism is linguistic and cultural in nature and never results in a racist or ethnic nationalism. Second, Herder's nationalism is grounded in the importance of growth, variety, spontaneity, and dynamism. Participation from individuals is therefore a central feature of Herder's nationalism: individuals are both recipients and participants; they inherit a tradition and in doing so, appropriate and shape it. So individuals are not stuck in their tradition: they also shape it. Third, Herder's nationalism never assumes an imperialistic or aggressive twist. Herder does indeed approve of linguistic and national patriotism. But even here he only defends a purified form of patriotism (*geläuterter Patriotismus*), and he forcefully condemns invasions in foreign countries.

The fourth and most important qualification and feature of his political philosophy is the fact that Herder endorses a form of cosmopolitanism. To be sure, Herder shows no appreciation whatsoever for people who define themselves as cosmopolitans in the sense that, in exposing love for humankind, they denounce the importance of national affiliations. Yet Herder does support cosmopolitanism in the sense that he expresses equal respect for the world's cultures, and for the individual differences within each of them. Herder's theory is grounded in an account of *Humanität* (humanity), which he believes is universally shared. Herder understands humanity as a unity, and he sees history as a chain of humanity that binds together individuals and nations.

This internationalist cosmopolitanism is most clearly displayed in Herder's important battle against colonialism and imperialism. Herder continuously lashes out against the arrogance of European states forcing others—especially African and American peoples—to live according to European norms, often as slaves. Rather than having brought civilization to the colonized nations, Herder argues that the European powers have

illegitimately destroyed local cultures and imposed their own. Herder also has nothing good to say about heroes such as Alexander the Great or Julius Caesar, who have oppressed many peoples and are responsible for numerous deaths. Likewise, he sets out against the crusades that, in his opinion, only brought death, destruction, and injustice. In fact, Herder is an anticolonialist cosmopolitan precisely because he is a nationalist: Herder's view is that we should allow each people to thrive on its own, undisturbed by others. Every people has a fundamental interest in not being overrun by aggressive others. The nation-state model essentially strives toward an international order in which every nation is enabled to determine its collective way of life, separate from other nations. Herder holds the idea, characteristic of the harmonious tendency present throughout his entire work, that the earth is big enough for every people to have its own distinct spot.

Herder additionally justifies this nationalistic policy to let every nation thrive within its own political borders by arguing that this allowance will enable humanity and the progress of reason to manifest itself. This progress will manifest itself in a natural way if peoples are provided with the means to pass down their own traditions and shape them according to their own beliefs, customs, and climates. There is not one universal yardstick of progress. Each culture has its own way of being. The culture of humanity shoots forth here and there in larger or smaller quantities and eventually blossoms in all nations. So the progress of reason has its own rules and customs. It does not step in the way of any political constitution (and Herder had also famously argued that no foreign nation should interfere in the civil war into which France entered in the aftermath of the French Revolution). With a friendly hand and as a gentle force, reason shows humankind its mistakes and outlines the right route to follow.

Historicism

Historicism

Historicism

Historicism played a key role in twentieth-century philosophies of history associated with Benedetto Croce, Friedrich Meinecke, and Karl Popper and reached a peak of influence within social science between the 1950s and the 1980s. It colored the thought of theologian Ernst Troeltsch and sociologist Karl Mannheim and has come into more general usage among social scientists, political theorists, and scholars of international relations over the past twenty years as a vague and often muddled description of any deployment of history as a leading mode of inquiry. Applauded by some commentators and demonized by others, historicism has attracted layers of contradictory meaning and innuendo that now render any clear or univocal definition impossible. It is better regarded as an array of connotation that includes any combination of the following elements:

1. An acknowledgment, usually positive, of a historical process that lends meaning to human existence.
2. A historical method that stresses individualization of its subject matter rather than impersonal or large-scale trends.
3. The relativization of all phenomena and their descriptions according to historical context.
4. An assumption, usually contested, that the past is held to display trends and mechanisms that predict future outcomes.
5. A doctrine, usually combative, that historical accounts should trump all others.

These elements are not merely distinctive in their claims but readily become mutually exclusive. It follows that no student of the human sciences should use the term or its adjective (*historicist* or *historicistic*) without stipulating an intended content.

Historicism must itself be historicized in order to make sense of its evolution as a constellation of ideas. First deployed in any of its modern senses in Italy by its greatest philosopher, Benedetto Croce, it appeared as a constituent his *Logic*, published in 1909 (Tessitore 1985). It occupied a place in his Hegelian understanding of Spirit and the way in which human action both embodied it, and it shared its underlying thrust toward the establishment of liberty. Croce wanted to bring together the ontological domain and what he saw as its concretization in human experience, one witnessed through historical thought that underlay historicism, a place where “life and reality are history and history alone” (Croce 1941). This metaphysical doctrine ran alongside, but did not emulate, other formulations of historicism that originated in Germany, where the impact of rival conceptions of *Historismus* have proved the most enduring. The word took the first of its German turns during a period of profound disturbance within the historical community over issues relating to method that may be subsumed under the wider rubric of a *Methodenstreit* that preoccupied scholars in the humanities from the 1890s to World War I. The so-called crisis of historicism had a more proximate root, however, in German theology, where the onset of hermeneutic inquiry had destabilized trans-temporal certainties and produced an atmosphere of relativism in which all texts—sacred as much as secular—required an acknowledgment of historical context as the key to their meaning. When Ernst Troeltsch drew attention to this new climate in his *Historismus und seine Überwindung* (1924), he caught a more general mood that the young Karl Mannheim echoed in an early essay on historicism in which he alleged that “all historical knowledge is relational knowledge” (Lee and Beck 1954; Megill 1997). Far from accommodating Croce’s term, the use of it as a synonym for relativism took it in a contrary direction.

However, victors in the *Methodenstreit*—a body of positivistic scholars normally referred to as the *Jungrankianer* after their devotion to maintaining the style of history pioneered by Leopold von Ranke—had no

interest in a present-centered historical consciousness and wished to reassert, for a rudderless postwar world, the values and techniques of traditional German method. Their champion in these years, Friedrich Meinecke, turned his mind to what he regarded as the true home of *Historismus* in a body of German historical scholarship that bridged the years of the Enlightenment and the rise of Rankian discipline. *Die Entstehung des Historismus* (1936) then came into English as *The Rise of Historism*, an excellent new word that, had it survived, would have prevented much confusion. By it Meinecke intended to signal the importance of history as a discipline aimed at individual events and personalities, one to be distinguished from science with its nomothetic ambitions but also from Hegelianism and Idealism as underpinnings for historical work. Like Ranke himself, Meinecke stood closer to Hegel than he realised and expected the historical individual to carry the imprint of the universal; but he recoiled from *Geist* as a measure of meaning, which brought him into immediate friction with Croce who wrote a critique of Meinecke's diversion from what he, Croce, took to be historicism's true function in world (Croce 1938).

By the outbreak of World War II, then, historicism already found itself impaled on three unequal prongs: as an idealist doctrine of becoming, as a prescription for relativism, and as a plea for individuation in method.

Enter Karl Popper in 1957, who at once made a bad situation infinitely worse. Part of Popper's originality resided in his talent for inventing new vocabulary for his many novel ideas. In *The Poverty of Historicism*, he excelled at appropriating old vocabulary and forcing it into a mold of his own creation. Popper's concern with history was neither philosophical, as with Croce, nor empirical, as with Meinecke. It was libertarian and emotional. His passionate dedication of the volume to the men and women "who fell victims to the fascist and communist belief in Inexorable Laws of Human Destiny" prefigured what was to follow: a polemical attack on the idea that individuals can do nothing to resist the tide of history conceived as a process of inevitable transformation, an idea that licensed, he believed, the assumptions behind totalitarianism. He needed a word for that dangerous idea and decided, disastrously, to call it "historicism" with a breezy remark that nobody would mind what the term *historicism* "really or

properly or essentially means” (Popper 1957). He then sought to show that *his* sense of historicism could be acquired from positions that were broadly sympathetic to natural science but also from stances that turned against it. These various streams of tendency found their confluence in a “historicism” that acted to undermine the individual’s autonomy and inculcate the view that history taught fatalism before the march of vast, impersonal forces—merely a short walk from his reflections on *The Open Society and Its Enemies* (1952), which blamed Plato and Hegel for instigating the tendency. Moreover, because Popper’s star was in the ascendant in Anglophone awareness, his new presentation of historicism won a rapid audience and soon became an established “meaning” of the term, especially during the more threatening years of the Cold War (Tinger 1961). He was helped in popularizing his individualizing social science by a colleague, J. W. N. Watkins, who brought a new austerity to method by claiming that all explanations of social behavior must of necessity reduce to behavior expressed in terms of the actions of specific individuals in order to claim “rock-bottom” status—a style of argument that carried over into history in the prosopography of Lewis Namier, who loathed totalitarian misuse of the past quite as forcibly as did Popper.

In thinking of more recent times, it is fair to say that Croce’s original formulation, resting as it did on Hegelian presupposition, has died away and that Meinecke and Popper’s contradictory assertions have taken center stage—the former preponderantly in German scholarship and the latter in Anglophone treatments. Just how deeply ran the difficulties of dealing with historicism revealed itself in conferences dedicated to explicating and analyzing the term: one at the Warburg Institute in London in 1974 and another at Essen in 1993 (*History and Theory* 1974; Oexle and Rüsen 1996). Both events reflected the turbulence that a postmodern epistemology might bring to the discussion of a concept stemming from either idealist or modernist assumptions. Hayden White, fresh from his *Metahistory* (1973), told the London conference that any distinction between “history” and “historicism” was now “virtually worthless,” and Frank Ankersmit, in his attempt at synthesizing some of the variants of historicism, told the Essen colloquium that all of them were “a product of their (authors’) own minds” with “no existence outside the language used for representing the past” (Ankersmitt 1995). When the more traditional mind of Georg Iggers

reflected on what was left of historicism in the 1990s, even he reduced it to a general reference to the *Weltanschauung* of modern historical scholarship and the arrival of “new historicism” as a specific doctrine of historical contextualization within literary and cultural studies (Iggers 1995).

Where, then, can one find this deliquescent idea in modern historical and political studies? The aggression with which Popper mounted his attack on historicism played into the aftermath of resistance to the later volumes of Arnold Toynbee’s *A Study of History*, completed in 1961, and indeed, all styles of history that raised their head above the parapet of the specific and finite. A mood of entrenched modernism in Anglophone historical studies placed a premium on the recommendations of Meinecke and similar thinkers to locate the past in individual entities that would speak for themselves and to avoid theoretical speculation (Bentley 1995). The historian of the Tudors, G. R. Elton, did not invent it but may stand as one of its more celebrated avatars. A similar mood penetrated the comparatively new field of international relations studies (IR), not least because of the dominance from the 1950s to the 1970s of a so-called British school under the leadership of Herbert Butterfield, Martin Wight, and, later, Hedley Bull. For Butterfield, and to a lesser extent for Wight, “theory” in evaluating international affairs took the form of a kind of historicism that insisted on making historical investigation the center of a mature conception of the field, a presupposition also evident in the early writing of Henry Kissinger in the United States. Those who, like Bull and the American theorist Kenneth Waltz, wanted to rescue IR from mere contextualization or compulsory reference to the work of professional historians and thus to avoid a “fall back into history,” as Stanley Hoffman put it, discovered considerable resistance from its Meineckian historicists (Hoffman 1987:21).

A still greater impact occurred in the field of political thought following the eruption of Quentin Skinner into its territory from the late 1960s. Skinner owed more to R. G. Collingwood and John Austin than to Meinecke, but his article on “Meaning and Understanding in the History of Ideas” seemed a historicist depth-charge aimed at traditional political theory (Skinner 1969). He sought to return “classic” texts to the place and time of their creation and to deploy historical contextualization as a powerful tool to reveal the inner “meanings” of an early-modern discourse too readily assimilated to

the meanings of a later period. Intentionality returned, too, as part of the package: Skinner wanted to reconstruct the intentions of authors and alleged that such intentions were by their nature *zeitbedingt*. He saw little value, and much potential distortion, in reading Thomas Hobbes, for example, as though his vocabulary could be understood in the senses accorded by the twentieth century, and he went on to construct a system of thought that revised the basis of method in writing the history of political thought more generally.

An inevitable reaction followed in the same way that it had against IR historicists. The most direct reply came from a political theorist and Hobbes scholar, Howard Warrender, who rejected Skinner's implicit claim that historical location trumped all other considerations in scrutinizing texts. What was significant, from the present point of view, were the *terms* of Warrender's rejoinder. He insisted that past texts were never merely "tracts for the times": They contained trans-temporal universals and variables that behaved with the stability of algebraic expressions that could be manipulated from the present without destroying their meaning. It remained important, he contended, to retain such universals "as some antidote to historicism, all forms of which are ultimately discriminatory." Above all, historians and their methods should never be allowed to "legislate" for the procedures of political theory (Warrender 1979). It is clear that Warrender's intended meaning of historicism had slid some distance from its original variants and become a generic descriptor for the historical enterprise itself—a shift that has become frequent in later years.

These confusions have become compounded in a postmodern age that sought from the outset to disrupt all forms of essentialism and contest univocal expressions of what a text "means." Skinner's willingness to countenance contexts—themselves limited and arguably arbitrary—as providing some form of geological explanation resembling Foucault's early concern with "epistemes" ran into the Pyrrhonism that became such a feature of epistemology during the 1990s. Ask only *which* contexts are the foundational ones and a methodological difficulty at once arises in contending that one has found *the* contexts that reveal true meaning (Bevir 1999). Meanwhile the larger shapes presented by Toynbee's version of historicism—the style that Popper wanted to eradicate—have paradoxically

reappeared in history in a sense of the past's having a "shape" and a revisiting of the idea that the past can persist as a form of presence (Munz 1977).

Cleaning up the mess of "historicism" is as simple as it is impossible. Meinecke's retreat into individuation should be referred to as either *Historismus* or to the word given by its original translator into English: *historism*. Popper's polemical description of inevitable historical forces that supposedly predict the future can be labeled *historicism*, since it has become the prevalent connotation outside Germany. Historical relativism should be called precisely that. History, the intellectual operation, has never needed any other word and should not be given one as a form of resentment against its claims. But it is almost certainly too late for simplicity. We are likely to continue mixing and matching these discordant strains and confusing audiences by an unspoken licensing of ambiguity among both enemies of and enthusiasts for the warring interpretations of historicism.

Ho Chi Minh Thought

What is known as Ho Chi Minh Thought is a diffuse body of ideas gleaned from the speeches, writings, and life of the prime minister (1945–55)/first president (1945–69) of the Democratic Republic of Vietnam, Ho Chi Minh, who was born as Nguyễn Sinh Cung and also used the names Nguyễn Tất Thành and Nguyễn Ái Quốc. His thinking can be loosely described as representing a preference for pragmatic solutions over ideological ones and is probably more significant as a historical phenomenon than as an ideology. It is quite different from the ideologies attributed to other powerful communist leaders because its content was not elaborated until about twenty years after Ho Chi Minh's 1969 death as his posthumous cult grew. Yet the reasons for the appearance of Ho Chi Minh Thought are similar to those that created a need for Mao Zedong Thought or the idea of *Juche*, attributed to North Korean leader Kim Il Sung. These national-communist bodies of thought gained prominence during periods of fragmentation of the internationalist communist movement, such as World War II, the Sino-Soviet split, or the breakup of the Eastern European communist bloc in 1989.

Until the end of the communist bloc and the disappearance of the Soviet Union, Ho Chi Minh mainly served as an example of revolutionary virtue to his nation. He was known to have devoted his life to gaining Vietnam's independence and was believed to have renounced family and creature comforts for the sake of his nation. But he did not claim to be the fount of universal wisdom. Two of his most quoted sayings during the Vietnam War

were: “Nothing is more precious than independence and freedom,” and “Solidarity, solidarity, great solidarity—success, success, great success.” His approach to diplomacy is often summed up by the maxim, “more friends, fewer enemies.”

In 1951, when the Vietnamese Communist Party (CP) resurfaced as the Workers’ Party, Ho Chi Minh was described in the Party newspaper as the “soul of the Vietnamese revolution,” while the party’s General Secretary Truong Chinh was called “the builder and commander of the revolution.” Chinh in those years was known as the main theorist among the Vietnamese communists. Later, he would be temporarily eclipsed by the southern leader Le Duan as a theorist, but Ho Chi Minh was never given that distinction during his lifetime. In fact, communist archives in Russia, Hungary, and East Germany have revealed that Ho was often criticized as too nationalist, too petty bourgeois, or too willing to compromise with the Party’s enemies. Yet in the 1960s, after he had withdrawn from day-to-day political life, Ho was increasingly presented as the essence of wisdom and a generalized father-figure, not to mention as the charismatic force that held his communist party together through many factional splits. His monk-like image remained so important that when rumors surfaced in the 1980s that he had married a Chinese woman in 1927, these were quickly quashed.

At the Seventh Party Congress in 1991, the Vietnamese leadership officially decided to add Ho Chi Minh Thought to its guiding ideology of Marxism-Leninism. From that time until the present, ideologists and philosophers have been combing through Ho’s writings to figure out what he thought about everything from women to military theory. His thought is said to cover all basic problems of the Vietnamese revolution, including national and class liberation, national defense, economic and cultural development, revolutionary virtue, and the nurturing of the next generation of revolutionaries. The difficulty with this method of compilation is to know which of his speeches were crafted collectively and which writings truly reflect his own ideas. In brief, however, his collected ideas and political acts demonstrate a pragmatic, flexible approach to communist dogma and a much greater attention to national unity than to the implementation of Marxist-Leninist class warfare.

To make this a more precise set of ideas would be problematic. That would require that Ho's differences with other Vietnamese leaders at such moments as the 1952 acceleration of land reform and the campaign of party rectification be made explicit. Rather than emphasize internal polemical debates, the compilers of Ho Chi Minh Thought stick to the safer path of collecting his homilies, often addressed to the general public. These have been used to show that he was a believer in permanent revolution as well as a proponent of individual rights and the "creation of a law-based state" in Vietnam (Quang 1993, 7–8). His preference for unity with the nationalist bourgeoisie during the wars of independence, in fact, limited his taste for permanent revolution of the type Mao Zedong practiced during the Cultural Revolution in China.

Hobhouse, Leonard Trelawney

The English philosopher and sociologist Leonard Trelawney Hobhouse (1864–1929) amended the academic theory of liberalism in a manner that paralleled the New or Progressive Party liberalism that emerged in many countries in the early twentieth century. His theories are often associated with the development of collectivism and the welfare state, so his ideas have some significance for other political traditions too. His most important and influential books were *The Labour Movement* ([1893] 1974), *A Theory of Knowledge* (1896), *Democracy and Reaction* (1904), *Morals in Evolution* ([1906] 1951), *Liberalism* ([1911] 1964), *The World in Conflict* (1915), *The Metaphysical Theory of the State* (1918), and his multivolume opus, *Principles of Sociology* (1918–24).

Hobhouse was the youngest child of a Cornish clergyman and his wife and had many aristocratic connections on both sides of his family. He was educated in Exmouth, Marlborough, and Oxford University before becoming a tutor at Corpus Christi College, Oxford, a position he held from 1890 to 1897. Temporarily disenchanted with academic life, Hobhouse subsequently became a journalist for the *Manchester Guardian* (1897–1902), the secretary of the antiprotectionist pressure group, the Free Trade Union (1903–05), and the political editor of another liberal newspaper, *Tribune*, from 1905 to 1907. He was, however, later appointed professor of sociology at the London School of Economics in 1907, a position that he held until his death on a visit to France in 1929.

Hobhouse's main contribution to modern liberal argument was to qualify the strict priority given to negative liberty in much earlier liberalism. In particular, he argued that state intervention in the economy could often be justified on humanitarian grounds, on democratic grounds, on ethical grounds, and on pragmatic grounds. His humanitarian argument was that the suffering caused by poverty should not be tolerated, his democratic argument was that it was rational for the general will to sometimes overrule private interests to promote the common good, his ethical argument stressed the importance of universal equality of opportunity, and his pragmatic argument was that providing a minimum level of welfare for everyone was a way of defending the foundations of a liberal society against its many opponents. An appropriate mixture of negative liberty ("freedom from," generally the untoward interference of the state and others) and positive liberty ("freedom to," particularly to develop one's potential) was the true test of civilization.

Hobhouse's politics were underpinned by a sophisticated theory of knowledge, of purposeful social evolution, and of interdependence ("the organic view of society"), although he insisted on a greater role for morality as a factor in human life than the nineteenth-century sociological pioneers Auguste Comte and Herbert Spencer. Scientific objectivity was very important to Hobhouse, but he also valued the subjective dimension of human knowledge and sought to synthesize theories of rights, duties, and utility as the basis of moral action. He placed particular stress on public education as a way of ensuring fair opportunity for all and on votes for women, including those who were propertyless, as a matter of justice. He also often criticized laissez-faire policies. At the same time, Hobhouse was aware of the danger of overactive government, but believed it was both necessary and desirable to humanize and democratize the state; he was also a severe critic of the fashionable Edwardian doctrine of eugenics. A strong opponent of the Boer War, in the early stages of World War I he supported a policy of neutrality, but he eventually became a vociferous critic of German militarism and a supporter of the British war effort. In the 1920s, he generally prioritized philosophy over practical politics, although he supported international organizations such as the League of Nations, and made a small contribution to the Keynesian Liberal "Yellow Book" report of 1928.

Hobhouse's writings frequently used ideas derived from the work of Thomas Hill Green—an English liberal (and Idealist) philosopher of an earlier generation—and traditionally, this connection has been presented as a major factor in the younger man's theories. For example, in one of his later works, *The Metaphysical Theory of the State*, Hobhouse praised Green for his interest in practical social reform. Nevertheless, recent scholarship has tended to emphasize the influence of John Stuart Mill and Giuseppe Mazzini, as well as Comte and Spencer, on Hobhouse's thought, plus the impact of the Cornish scholar's studies of the British labor movement and his interest in natural science.

Hobson, John Atkinson

John Atkinson Hobson (1858–1940) is one of the leading New Liberal political theorists and political economists. He was born on July 6, 1858, son of a newspaper proprietor in Derby, England. He was educated at Lincoln College, Oxford, before becoming a schoolteacher. Hobson moved to London in 1887, where he became involved with Marxists and other radicals. His first book, *The Physiology of Industry* ([1889] 1992), ended his chances of an academic career. Coauthored with Albert F. Mummery, the book denied some of the central tenets of the marginal economics that formed the orthodox position in British universities. Hobson's journalistic reputation grew as a result of his reports on the Boer War following an extended visit to South Africa in the 1890s. At the same time, his prolific output of books and articles started to earn him a significant reputation in radical circles. Together with the writings of Leonard T. Hobhouse, Hobson's vast output of books, articles, and journalism exerted a profound influence over the direction of political thought and practice in the early parts of the twentieth century, not least through his links to John Maynard Keynes. Even though Hobson was not a Marxist, Vladimir Illyich Lenin acknowledged Hobson's book *Imperialism* (1902) as having a very significant impact on his own *Imperialism: The Highest Stage of Capitalism* (1917). Hobson continued to write and lecture almost until his death on April 1, 1940. He was a key figure in the important London society the Rainbow Circle, with some of his last lectures to the South Place Ethical Society published as late as 2011.

Human Valuation, Social Organicism, and Imperialism

Even though Hobson's thought drew on the British idealism of Thomas Hill Green, it found its most radical underpinnings in profound debts to the humanistic political economics of John Ruskin, on whom he published a book in 1898. Hobson reflected frequently on Ruskin's famous dictum, "There is no wealth but life." Rather than focusing on the accumulation of money and finance, Hobson argued that true economic growth was found in the ability of individuals to lead happy and fulfilling lives. In fact, Hobson insisted that traditional measures of wealth had no intrinsic value, mattering only to the extent that they enabled individuals to realize those things that made them truly content as human beings. Hobson argued that one could promote real wealth only if one had a proper understanding of the wider contexts in which real individuals live. In advanced modern societies, that meant understanding the organic nature of contemporary capitalism. Rather than perpetuating the fiction of the self-sufficient entrepreneur or the self-made man, one should explore the ways in which all parts of society interact with one another. These parts interact well or badly to the extent that they promote or hinder individual happiness and contentment. Hobson exposed many ways in which modern capitalism worked very badly from this organic perspective. The same held true at the social and political levels, both of which were riven with artificial hierarchies, working in the interests of elites rather than the good of the whole society. A healthy society was an evolving natural organism, rather than a directed artificial one. Consequently, Hobson rejected both capitalist power and state socialism. Hobson wrote an impressive number of works analyzing the abusive multifaceted processes that characterize the actual workings of modern capitalism. He advocated the creation of a strong state that listened to the demands of society while making the final decisions of matters of public policy. Nevertheless, as a New Liberal, he argued that, while in many circumstances quite extensive state intervention would be needed to ensure that economic and social relationships were nonabusive, the heart of a healthy society remained ultimately in the spontaneous interactions of free individuals and the groups they formed. Ultimately, it was essential that the people could vote out a misguided government.

Hobson never saw political and economic power as exclusively domestic affairs. Even his earliest writings were concerned with the effects of international linkages on the condition of the poor and marginalized around the world. Frequently, he traced these webs of influence to economic poverty and war, not least through the mechanisms of imperialism. He extended and revised the first comprehensive statement of his position, given in *Imperialism* (1902), in a series of South Place Ethical Society lectures given during the 1930s. Increasingly, he sought to develop and promote the possibilities for an international society through which humanity could achieve peace in ways that were not infected by imperialism.

Human Nature, Theories of

Assumptions about human nature are explicit or implicit in all political philosophies, social programs, ethics, and religions. But the concept of human nature has had many different interpretations, and its ambiguity should be noted.

In asking about human nature, we usually have in mind human dispositions and behavior as we know them, in the society we live in. Early modern thinkers such as Thomas Hobbes, John Locke, and Jean-Jacques Rousseau theorized about a supposed state of nature before the advent of government. In fact, humans (and our prehuman ancestors) have always been highly social creatures, so the idea of individuals coming together at some stage of history to form society by a social contract is a myth if taken literally. It was used by Hobbes as a conceptual device to justify the state having a monopoly of coercive force by pointing out the disorder and insecurity that tends to break out when authority fails and the natural selfishness, greed, and fear of individual human beings is not restrained. But the human nature that is revealed when the modern state breaks down may not be the same as the human nature in more primitive society before the advent of state authority, such as in the Indian tribes in America that Locke had in mind.

Another distinction is between a conception of human nature as what is innate in each individual at birth (or for some, given our understanding of genetics, at conception), as opposed to what develops in the adult after maturation, socialization, and education. This distinction has given rise to

endless nature versus nurture debates, especially since the advent of neo-Darwinian accounts of human nature. (The right answer usually seems to be a bit of both but very hard to distinguish.) There is thus a question of how far political programs and political changes can change human nature, for better or for worse.

Another long-standing debate is over whether human nature is basically good, just needing appropriate social conditions in which to flourish, or inherently sinful. Rousseau fostered the belief that what is natural is good, and the unnatural is bad. But air travel, heart surgery, celibacy, contraception, and the consumption of cows' milk can all be said to be unnatural—yet it does not follow that they are wrong. Conversely, it is often said it is natural for human beings to be lustful, selfish, aggressive, and prejudiced against other tribes or nations—but that does not make these tendencies good.

According to optimistic political philosophies (typical of the Enlightenment), cultural progress can be made and average human nature can be improved; according to utopian programs, it can be perfected. But for political realists, human beings will always need discipline and social restraint, and according to religious conceptions, we stand in need of some kind of salvation that goes beyond human ethics and politics.

Plato and Aristotle

The ancient Greek philosopher offered an elaborate analysis of humans and society in his lengthy dialogue, *The Republic*. Plato's theory of individual human nature finds three mental factors at work in us—reason (intellect or rationality), spirit (personality or character, especially courage, self-assertion, and ambition), and appetite (the bodily based desires). Depending on which of these elements is dominant, we get three kinds of people, whose main desire is, respectively, for knowledge, reputation, or material gain. The three factors can conflict, and what is needed for human flourishing is a harmonious combination of them. Reason should, however, be in overall control, for Plato believed that by the use of it we can come to know what is ultimately real and good (i.e., the forms).

But Plato also recognized that we are ineradicably social beings. Individuals are not self-sufficient, and a lone human would miss out on the distinctively human activities of language, learning, cooperative work, friendship, play, art, and politics. He proposed an ambitious program of social engineering, laying great stress on education. Just as the reasoning part of the soul ought to direct the individual, so those people with the most highly developed reason (which includes philosophical, moral, and political knowledge, and wisdom) ought to rule society. So Plato proposed a threefold class division, which included the guardians (the ruling elite), the auxiliaries (state functionaries, soldiers, and police), and the workers (the economic basis).

Plato's great successor Aristotle provided a less utopian, more this-worldly analysis of human nature and society in his *Nicomachean Ethics* and *Politics*, which also strongly emphasized that the best kind of life consists in exercising our rational capacities. But his conception is limited by his assumption of a rigid class structure, the unfitness of women for public roles, the existence of slaves by nature, and the inferiority of barbarians to Greeks.

Medieval Conceptions

Medieval conceptions of human nature from Augustine to Thomas Aquinas synthesized classical ideas with the monotheism of Christianity, Judaism, or Islam. The inherent telos or purpose of human life recognized by the Greeks was identified with the will of God. Our human tendency to diverge from that purpose was seen as needing divine assistance to overcome. Political authority was needed to hold human sinfulness in check and to enable the religious authorities to fulfill their distinctively religious function.

Early Modern Conceptions

With the advent of science, the medieval world picture broke down. Human beings began to be seen just as clever animals with no inherent purpose in life beyond survival and reproduction. In the mid-seventeenth century Hobbes's *Leviathan* was one of the first articulations of a bleakly naturalistic view of human nature, arguing that the only justification for the

existence of the state was to avoid the insecurity and conflict that exists in its absence.

A few decades later, Locke painted a slightly less bleak picture. For him, the pre-governmental state of nature already contains a moral obligation to the effect that no one ought to harm any other in his life, health, liberty, or possessions. But not everyone will respect this moral law, so Locke maintained that in the pre-political state there was a right to punish transgressions and to take reparations. But when there is scarcity of vital resources, forcible competition is likely to ensue, and so Locke like Hobbes recommends civil government as a remedy for the inconveniences of the state of nature.

In his *Discourse on Inequality*, Rousseau argued that the beginning of society had introduced all sorts of unnatural practices and inequalities. He depicted “the noble savage” as wandering in the forests without work, speech, home, war, or relationships and without need of his fellow men and without desire to hurt them. But in *The Social Contract*, Rousseau offered a more positive view of society, arguing that human beings can find their most complete fulfillment in civil society.

Immanuel Kant

Immanuel Kant’s critical philosophy echoes the classical views of Plato and Aristotle in saying that it is our human nature to exercise both theoretical and practical rationality. Contrary to other Enlightenment philosophers such as David Hume, who found the source of morality in feeling, Kant strongly insisted on the rational nature of the “categorical imperatives” of ethics. For him, the objective foundation for ethics lies in the principle of respect for persons as rational beings and ends in themselves. He thus provided a secular basis for the recognition of universal human rights.

But we are not purely rational beings, we are finite creatures with bodily appetites, and desires for love, approval, status, and power, so there is a constant struggle within us between selfishness and morality. In his late work on religion, Kant acknowledged the radical evil in human nature, namely our great difficulty in doing what we ought to do, and our tendency

to adulterate morality with other motives. Our unsocial sociability consists in our need and desire to be members of society combined with our tendency to be selfish and competitive. Kant placed his hopes in a gradual improvement in individuals and society through a purified form of ethical-religious community and progress in education, culture, and democracy.

Karl Marx

Karl Marx, writing in the mid-nineteenth century, presented a materialist theory of history, outlining the development of human society through a series of economic stages, from ancient slavery through medieval feudalism to capitalism, which he predicted would be superseded by communism. His crucial claim is that the prevailing type of human nature and society depends on the mode of production of the necessities of life.

In his *Theses on Feuerbach*, Marx wrote, “The real nature of man is the totality of social relations,” and elsewhere, he wrote, “All history is nothing but a continuous transformation of human nature.” These quotes have been widely taken by many followers of Marx to mean that there is no such thing as a fixed human nature so that what is true of people in one society or period may not be true in another place or time. As the economic basis of society changes, laws, politics, morals, ideology, and religion will change too. Even the ways in which we produce our food and bring up our children are socially learned. So what seems instinctive or natural in one society or epoch—for example, a certain role for women—may be quite different in another. Not everything about human beings can be explained in terms of facts about individuals; the kind of society they live in must be considered too.

But it does not follow that everything about human beings can be explained in terms of sociology and economics, and nor did Marx think so. There is our biological nature—the fact that human infants are born helpless and need an extended period of care and socialization to become adults. Marx also recognized that we are active beings, different from the other animals because we produce our means of subsistence. Moreover, he associates a value judgment with this activity, namely that the kind of life that is appropriately fulfilling for us involves rational and purposive activity. This

value judgment comes out in his diagnosis of human alienation in industrial labor, his passionate concern with social justice, and in his utopian ideal of a future society in which everyone can be free to cultivate his or her talents (Geras 1983).

From Darwin to Evolutionary Psychology

In contrast to the socialist or communist ideal, Social Darwinists such as Herbert Spencer in England and W. G. Sumner in the United States appealed to Darwinian ideas to justify the free market economy. They interpreted the phrase “survival of the fittest” not just in the factual sense that those individuals best fitted to the prevailing environment will tend to leave more progeny, but in the normative sense that it is a good thing that the less “fit” should not survive or reproduce. This reasoning seems to justify the ruthless neglect of the weak, but it leaves out of consideration our human tendencies to cooperation; it treats individuals or families as isolated units without acknowledging their membership in larger social groups that have profound effects on their identities, obligations, and rights.

In the mid-twentieth century, there was a neo-Darwinian revolution in biology when discoveries in genetics revealed the biochemical mechanism of natural selection and studies of animal behavior showed how much of it is innate. Evolutionary accounts of human nature have been widely promoted. Edward O. Wilson proposed a new discipline of sociobiology, which he claimed would revolutionize the social sciences and in which he offered explanations of our aggression, sexuality, altruism, ethics, and religion in evolutionary terms. But some other biologists hotly criticized both the scientific claims of sociobiology and what they saw as its reactionary implications of limits to programs of social reform (Rose, Lewontin, and Kamin 1984).

In recent years, there has been an explosion of evolutionary psychology (Pinker 2002; Ridley 1996; Wright 1994) offering theories of genetically based human predispositions seen as the result of a long history of evolution, whose expression will depend on culture and individual development and learning. Yet much of this remains controversial because (a) it is so difficult to distinguish the contributions of heredity and

upbringing and (b) because of the moral and political involvements of the whole topic of human nature and behavior (Clark 2002; Dupre 2001; O'Hear 1997). Whenever claims are made about our evolutionary nature, or about innate differences between human races, sexes, or social classes, we must be alert to the possibility that such assertions may serve the interest of some social groups rather than others. Factual evidence can show only how people have so far behaved in certain forms of society—but that does not show that change is impossible. Feminist theorists have rightly asked whether existing differences between men and women are a matter of innate, biological, natural tendencies or whether they have been produced by forms of cultural conditioning serving the perceived interests of men (Jaggar 1983; Mill 1988).

Postmodernism and the Enlightenment

Those who see us as living in a “postmodern” epoch often pour scorn on the Enlightenment. A heavyweight attack has been mounted by Alasdair MacIntyre in his diagnosis of the parlous state of twentieth-century moral philosophy. He argues that the Enlightenment project of justifying morality failed because we have been so obsessed with the kind of rationality shown in the physical sciences that we could not find a place for any teleological view of human nature as having an essence that defines our true purpose. In MacIntyre's view, this has meant that our moral vocabulary has been cut off from its roots, so we can find no firm foothold on which to resist the slide toward individualism and moral subjectivism.

Certainly, it has been characteristic of much moral and political thought since the seventeenth century to assume that there are no objective values or purposes in human life, that it is up to individuals to make their own decisions on such matters, and (with dubious consistency) that human nature is almost infinitely malleable by social and political changes. Hence, the prevalence of liberal and perhaps postmodern political philosophies see the only justified purpose of government as to protect and enhance individual freedom. But we have noted here that both Kant and Marx, who are often credited with such a view, did not, on closer inspection, entirely endorse it and have more in common with classic and religious philosophies than MacIntyre acknowledges.

Humanitarian Intervention

The question, “When it is legitimate to intervene in a sovereign state for the purpose of halting or preventing a mass atrocity?” has moved from the periphery to the center of the international political agenda. Despite lacking a universally agreed definition, the term *humanitarian intervention* dominates the discourse surrounding this issue. While there is general consensus on the importance of humanitarian intervention, it is also one of the most divisive issues in contemporary international relations, with the term itself increasingly a source of controversy.

Definition

Myriad, often contradictory, definitions of humanitarian intervention exist. The term is widely used in legal, political, and philosophical literature, and the definition employed tends to reflect the field of the analyst. The major contention that surrounds the definition of the term derives largely from the normative assumptions inherent in the word *humanitarian*. The use of this subjective adjective necessarily complicates the formation of an objective definition given that the word *humanitarian*, to a large extent, constitutes a positive value judgment. *Humanitarianism* and *humanitarian action* are terms widely used among aid workers and nongovernmental organizations. In this context, the term humanitarian is used to denote an altruistic, apolitical concern for human welfare. Linking humanitarianism to military action is, for many, inherently contradictory, and thus, the term is rejected

by those who wish to preserve the neutrality and nonmilitary nature of humanitarianism.

Nonetheless, while concerns exist about the very validity and efficacy of the term, it remains widely used, and it is possible to identify three generic themes common to the majority of definitions. Definitions generally agree that:

the intervener must be a third party to the conflict and from a different state,

the action must be taken without the consent of the host state,

the action must involve the use of force, and

the action must be motivated, to a significant extent, by humanitarian concerns.

The latter point is particularly contentious; some academics, most notably Nicholas Wheeler (2002), have disregarded the importance of motives altogether. While the majority of definitions do emphasize the importance of humanitarian motivations, two issues arise. First, to what extent must the motivation be humanitarian? A purely humanitarian motive is widely deemed too onerous a requirement, though there is no consensus on when the degree of self-interest trumps the humanitarian credentials and the action becomes simply a military intervention. Second, it is in practice very difficult to determine the true motivation behind a particular intervention given that the public justifications offered by interveners may not constitute the truth.

Definitions of humanitarian intervention do not generally refer to its legality. This fact reflects a broad consensus that the legality of an action has little bearing on its putative status as a humanitarian intervention. The legality of humanitarian intervention, particularly unilateral intervention, is keenly contested, however.

History

Questions about the morality of the use of force have been posed, in some form, for millennia. The evolution of the just war tradition from Augustine (354–430) on incorporated many of the themes that still dominate the debate on humanitarian intervention today. The just war tradition, however, concerns itself with determining justifications for the use of force generally, though particularly in self-defense, whereas humanitarian intervention has a narrower focus derived from the evolution of the sovereign state and the issue of protecting foreigners.

Debates on humanitarian intervention became more focused, and arguably more problematic, as international society became organized into a community of sovereign states in the seventeenth century. This new systemic configuration was based on the principle of noninterference *cuius regio eius religio* (whose region, his religion) enunciated at the 1555 Peace of Augsburg and later affirmed by the 1648 Treaty of Westphalia. The very idea of sovereignty implies inviolability, the primacy of the principle of nonintervention, and thus a rejection of international jurisdiction in favor of national law. Indeed, the term *humanitarian intervention* was first used in 1880—by William Edward Hall—and can be understood only in the context of the prevalence of the principle of territorial integrity. This was a conspicuously European norm, however, with vast areas of the globe deemed to be *terra nullius* and open to intervention and subjugation. Such colonialism was routinely justified as benevolent and portrayed as the white man's burden or in French, *mission civilatrice*.

As states assumed more formal legal powers and entitlements, the asymmetry between the rights of states and the rights of the individuals within them increased. Thus, particularly after the signing of the United Nations Charter in 1945, the status of humanitarian intervention became more ambiguous and contentious, as state officials could claim their equal right of behalf of a nation to deny equal rights to citizens within their nation. While the Charter included certain references to human rights, the codification of sovereignty and proscriptions on external interference contained in Articles 2.1 and 2.7 were more explicit.

During the Cold War, the nuclear standoff between East and West sidelined the issue of responding to intrastate human rights violations. Both the United States and the Soviet Union were primarily concerned with maintaining order within their respective spheres of influence and a balance of power internationally. Additionally, following decolonization, the norm of nonintervention was championed by the many newly independent states that considered sovereign inviolability to be a bulwark against renewed external interference. Three cases regularly cited as examples of humanitarian intervention during the Cold War are India's intervention in East Pakistan in 1971, Vietnam's intervention in Cambodia in 1978, and Tanzania's intervention in Uganda in 1979. In each case, however, international reaction varied and the motives of the intervening parties were unquestionably mixed.

The tension between state sovereignty and ostensibly universal human rights became especially keen in the post-Cold War era. The combination of Western hegemony, the primacy of the liberal democratic state, and the effects of globalization led to a dramatic increase in humanitarian advocacy and support for external intervention. Many crises, such as dissolution of the former Yugoslavia, the genocide in Rwanda, the conflict in Darfur, and the violence accompanying the 2011 Arab Spring—especially in Libya and Syria—have served as catalysts for often heated debate on this issue.

The controversy surrounding NATO's intervention in Kosovo sparked renewed interest in humanitarian intervention and led to the International Commission on Intervention and State Sovereignty's (ICISS) seminal 2001 report *The Responsibility to Protect*, which claimed to constitute a new template for the relationship between states, their citizens, and the international community.

Legal Status

There is much debate about the legality of humanitarian intervention, and the issue has led to questioning of the very efficacy of international law. Under Chapter VII of the United Nations Charter, the Security Council is empowered to sanction military action to “maintain or restore international peace and security.” An action sanctioned by the Security Council to

prevent or halt a mass atrocity would thus constitute a legal humanitarian intervention, the March 2011 intervention in Libya being arguably an archetypal example. Humanitarian interventions undertaken without the Security Council's authorization are of more contentious legality. NATO's intervention against the Federal Republic of Yugoslavia in 1999 over the treatment of ethnic Albanians in Kosovo was welcomed by many as a humanitarian intervention, although the prevailing view is that it was technically illegal. This ostensibly illegal but legitimate intervention led many to argue that international law should be reformed and that the sanctioning of humanitarian intervention should not be the preserve of the United Nations Security Council given China's and Russia's record on human rights. A vocal constituency emerged in favor of rules on the use of force based more on natural law and reflective of the varying moral rectitude of states.

At the 2005 United Nations World Summit, states unanimously endorsed the principle of the responsibility to protect (R2P). Constituting an amended version of the principles first articulated by the ICISS, R2P establishes the responsibility of all states to protect their citizens from genocide, war crimes, crimes against humanity, and ethnic cleansing. It was also agreed that the international community had a responsibility to react if the host state was unable or unwilling to do so. While this agreement was heralded by many as a triumph, others have argued that the principles on R2P outlined in paragraphs 138 and 139 of the World Summit *Outcome Document* merely reconfirm previously existing rights and responsibilities. Legally, humanitarian intervention remains the preserve of the Security Council, and thus all action is potential prey to the veto powers of the five permanent members: China, France, Russia, the United Kingdom, and the United States.

Objections

The most commonly advanced objection to humanitarian intervention is that it constitutes a means by which powerful states can subjugate the weak. History is replete with examples of states justifying invasion and occupation on spurious humanitarian grounds. Most infamously, Adolf Hitler portrayed Germany's invasion of Czechoslovakia in 1939 as a

humanitarian intervention to protect the German-Czech minority. In recent years, the U.S.-led invasion of Iraq in 2003 ignited controversy precisely because of the largely, though not exclusively, *ex post facto* humanitarian justifications offered by the intervening coalition. Humanitarian intervention is, therefore, dismissed by some as a form of neocolonialism, with control of oil being the dominant contemporary concern.

A related objection, but less concerned with motives, is the suggestion that humanitarian intervention constitutes the illegitimate imposition of a particular set of Western norms or values. Often termed the relativist position, this critique rejects the idea of universal human rights in favor of a culturally divergent plurality of norms. Since the World Summit in 2005, however, the grounds for intervention have been explicitly limited to four crimes: genocide, war crimes, crimes against humanity, and ethnic cleansing. The relativist argument is largely untenable in the context of these crimes and the universal consensus that they are proscribed.

A further objection is that voiced by certain realists who argue that the primary interest of states should be to preserve national security and maintain international peace and stability. Intervention, it is argued, whatever the pretext, causes conflict and instability. States that claim to be using force for the universal moral good, it is argued, are typically lying but are also a threat to international peace and stability. Increased intervention leads to a more violent world, which by definition claims more lives than nonintervention even if a particular state is oppressive domestically. Intervening to protect the oppressed in one state will additionally, some argue, encourage disgruntled groups in other states to provoke their state into committing domestic crimes in the hope that this situation will compel external forces to intervene. Thus, crises that could have been settled domestically and with limited force become internationalized and bloodier.

The poor record of humanitarian intervention is also often cited by critics. In many cases, intervening to stop violence has not created lasting peace, and the interveners have been forced to maintain costly and often protracted commitments in states marred by deep societal cleavages. The ongoing international commitments in Bosnia, Kosovo, and Afghanistan, as well as

the bloody aftermath of the intervention in Iraq, give evidence of the limitations of external intervention and state building.

Contemporary Relevance

Due to the disrepute associated with the term itself, many advocates of external intervention for humanitarian purposes have increasingly framed their discourse in the rhetoric of the R2P. This phrase incorporates more than military intervention, however, and humanitarian intervention remains both a more established and narrowly focused term. The intrastate violence that accompanied the Arab Spring precipitated a rejuvenation of interest in humanitarian intervention and renewed critiques of the inconsistent international response to intra-state crises. While the intervention in Libya in March 2011 was widely welcomed, even by the Arab League, the nonintervention in Syria was cited as evidence of the hypocrisy of the Security Council and the prevalence of geopolitics.

Contemporary debates focus largely on two issues: first, determining who has the right to intervene and whether existing laws on the use of force should be amended; and second, how best to engage in a humanitarian intervention and subsequently rebuild war-torn societies. Because intrastate crises have been a perennial feature of international relations for centuries and show few signs of abatement, the issue of humanitarian intervention appears destined to remain a key issue in international relations and one that raises profound questions about international law, universal morality, and the role of the modern state.

Hume, David

David Hume (1711–76) was a best-selling historian, essayist, polymath, and enormously influential and important philosopher of the eighteenth-century Scottish Enlightenment. He was both a philosophical radical and a political moderate. Hume was intellectually skeptical, particularly about the scope and power of reason and supernatural beliefs (such as the existence of God) and averse to the airy sciences of traditional metaphysics, preferring to restrict himself to fact, experience, and observation, often with devastating effects. He had a very keen awareness of the strange infirmities of human understanding, which disposed him toward doubt and epistemological caution. Politically, he was essentially a pragmatist who eschewed strongly ideological positions.

Life and Background

Hume was born in Edinburgh to a respectable, moderately prosperous family whose home (Ninewells) was in the lowland Borders region of Scotland where he grew up. At a precociously young age, ten or twelve, he started studying law at the University of Edinburgh, where he bit into the apple of knowledge that left him with a powerful distaste for the law and for everything but “Philosophy and general Learning.” Unfortunately, as the younger son of a family of only moderate wealth, Hume could not afford to live the life of a gentleman (i.e., someone who did not need a job to maintain himself), so he initially returned to Ninewells after abandoning his

study of the law so that he could concentrate on developing his own philosophical ideas. This, however, eventually led him to the brink of a mental and emotional collapse, after which he moved to the village of La Flèche in Anjou, France, where he lived frugally and wrote his first (and most ambitious and influential) philosophical work, *A Treatise of Human Nature*, which he finished at the age of just twenty-six. The first two books were published anonymously in London in 1739, with the third following in 1740. To Hume's great disappointment, the work fell dead-born from the press, failing to find a significant readership and or even to evoke a critical reaction. Two volumes of *Essays, Moral and Political* appeared in 1741 and 1742. On this basis, Hume applied for the Chair in Ethics and Pneumatical Philosophy at the University of Edinburgh in 1745, but was passed over primarily because of his heterodox religious views at a time when Scotland was still a predominantly devout and God-fearing nation dominated by an influential and well-placed clergy. His application for the Chair of Logic at the University of Glasgow six years later met the same fate, and for essentially the same reason. International fame had to wait until Hume published his best-selling, six-volume *History of England*, which he wrote while librarian of the Edinburgh Faculty of Advocates, in which role he was reprimanded for ordering obscene books, as understood in Scotland, which was still predominantly Calvinist. His *History* was published between 1754 and 1762 so that by the time he arrived in Paris as the private secretary to the British ambassador to France, Lord Hertford, in 1763, he was a major celebrity and the toast of the salons where he enjoyed the company of the leading French thinkers and writers of the age, including Denis Diderot, Jean le Rond d'Alembert, and the Baron d'Holbach, who affectionately called him le bon David for his affable nature and tolerant, skeptical outlook. He was as far from the severe, dour stereotype of the puritanical Scot as it was possible to be. Writing later in *My Own Life* ([1776] 1980), Hume characterized himself as "a man of mild dispositions, of command of temper, of an open, social, and cheerful humour [*sic*], capable of attachment, but little susceptible of enmity, and of great moderation in all my passions" (Hume [1776] 1980, 615). In France, he was often gently mocked for his gaucherie, provincial manners, and heavily accented French, while he, for his part, harbored reservations about the excessive civilities of Paris. Even so, he found life there highly congenial and even considered moving to Paris permanently: "There is a real satisfaction in living in

Paris,” he wrote, “from the great number of sensible, knowing, and polite company with which the city abounds above all places in the universe” (Hume [1776] 1980, 614).

After three highly successful years in the French capital, Hume retired to Britain not only independent, but opulent, eventually resettling in Edinburgh, where he enjoyed the company of other luminaries of the Scottish Enlightenment, including Adam Smith, Adam Ferguson, William Robertson, and Joseph Black, all of whom were fellow members of the so-called Poker Club. He entertained frequently and enjoyed cooking, especially his specialty of sheep’s head soup and beef with cabbage. He later reflected that these years might be the ones he would most like to live over again. On his deathbed, Hume read the pagan humorist Lucian, much to the annoyance of his religious opponents. He died there peacefully and with admirable equanimity in 1776. His controversial and devastating *Dialogues Concerning Natural Religion* (1779) was published shortly thereafter, reinforcing his reputation for philosophical acuity and religious skepticism. He had arranged for his compatriot the eminent architect Robert Adam to design his tomb, with only his name and dates on it. He was buried at Calton Hill cemetery overlooking Edinburgh. Hume’s close friend the economist and moralist Smith eloquently eulogized him as being as close to perfectly wise and virtuous as a person can be.

Philosophy

One of Hume’s boldest and most original arguments occurs in the first book of his *Treatise of Human Nature*, where he argues that the common belief in natural causation is rationally groundless. The relationship between cause and effect—as when, for example, one billiard ball strikes another thereby causing the latter to move—cannot really be inferred by reason, as the philosopher René Descartes had argued it could. According to Hume, the constant conjunction of two objects typically leads us to assume that they must be causally related to each other, but this assumption is actually unwarranted by reason, according to Hume. All that we can really say about them is that their relationship is based on our past experience of them, and we have no reason to assume that the future will necessarily be like the past. Even so, he thought that we tend to develop mental habits based on such

inductive, probabilistic conjunctions that cannot really be deduced by a priori reasoning. These habits of mental association are often so strong that we just assume that objects must be linked causally, a conclusion that is nothing more than a projection of our own assumptions on to the world rather than something that can be established by demonstrative reasoning.

Hume believed that our minds tend to assume many such fictions for which there is really no rational justification at all, although such beliefs may be explicable in natural terms. For example, he cast doubt on the common belief that there is such a thing as a self that persists throughout one's life. As an empiricist, Hume thought that our perceptions are based on sensory impressions. In fact, we have no single, continuous impression of our own self over time, only constantly changing impressions and sensations that we do not rationally know to be related to a single, enduring identity. Just as we habitually ascribe an identity to external objects that we may regularly observe in the world, so we tend to assume the same about our own inner self, even though, in reality, identity is not something that really belongs to these different perceptions and unites them; rather, "it is merely a quality, which we attribute to them, because of the union of their ideas in the imagination, when we reflect upon them" (Hume [1739] 1978, Book I, Part IV, sec. VI). Hume described the mind as a type of theater where "several perceptions successively make their appearance, pass, re-pass, glide away, and mingle in an infinite variety of postures and situations," which typically leads us to the unwarranted belief that there is a persisting self that underlies our constantly ever-changing perceptions. In answering the question, "What does one really see when introspecting on one's mind?" Hume wrote,

For my part, when I enter most intimately into what I call *myself*, I always stumble on some particular perception or other, of heat or cold, light or shade, love or hatred, pain or pleasure. I never can catch *myself* at any time without a perception, and never can observe anything but the perception. (Hume [1739] 1978, Book I, Part IV, sec. VI)

On the perennial debate between free will and determinism, Hume was a classical compatibilist, like Thomas Hobbes. He defined liberty as "a power

of acting or not acting, according to the determinations of the will” (Hume [1739] 1978, Book I, Part IV, sect. VI). Thus, all human actions are the consequences of causal necessity. Yet everyone is free to the extent that he is “not a prisoner and in chains.” Hume held that such causal necessity is entirely consistent with moral responsibility.

Another important and influential example of Hume’s skepticism in his *Treatise* concerns the difficulty of deriving values from facts. On this subject, he merely observed a common tendency for people to jump from descriptive statements (e.g., he is short) to prescriptive statements (e.g., he ought to receive less) without any bridging argument explaining how to get from the one to the other. In the twentieth century, the Cambridge moral philosopher G. E. Moore labeled this intellectual leap from *is* to *ought* “the naturalistic fallacy” and developed Hume’s passing observation into a systematic rejection of ethical naturalism in his book *Principia Ethica* (1903).

Hume denied that either God or reason could really provide a plausible basis for our ethical beliefs. He not only doubted the existence of God, but also was highly critical of what he saw as the disastrous moral and political consequences of religions in human history, particularly dogmatic monotheistic faiths such as Christianity and Islam, which he compared unfavorably to the polytheistic faiths of antiquity. He also believed that reason is the “slave of the passions” with no power to motivate human action or tell us which ends we ought to pursue. He quipped that “Tis not contrary to reason to prefer the destruction of the whole world to the scratching of my finger” (Hume [1739] 1978, Book II, Part II, sec. 3), although he meant this quite literally. However, Hume shared the belief common among philosophers of the Scottish Enlightenment that we have natural (and therefore universal) virtues such as gratitude, kindness, patience, due pride, and sympathy for other human beings in their suffering, virtues that only motivate us to act when they engage our passions with sufficient force to overcome contrary passions. These natural virtues have been supplemented throughout history by artificial virtues such as chastity, promise keeping, and justice, the rules of which have been devised to “best serve public utility.” Such virtues depend on conventional rules rather than arising spontaneously from our nature. Hume realistically recognized that

we are also prone to be selfish, that human nature contains impulses that pull in both directions and needs to be judiciously constrained and tempered by convention and custom.

As he did with much of the rest of his *Treatise*, Hume later revised that part of the work that dealt with morality and republished it in 1751 as an *Enquiry Concerning the Principles of Morals*. Although he viewed this work as clearly the best of all his writings, he was disappointed that it too received little attention. He had earlier revised and published the first book of the *Treatise* as a separate *Enquiry Concerning Human Understanding* (1748), and he later shortened the second book, which appeared as a revised essay “Of the Passions” in Hume’s *Four Dissertations* (1757). All of these extensive recastings of his troubled intellectual offspring reflect Hume’s verdict that he had been “guilty of a very usual indiscretion in going to press too early” (Hume [1776] 1980, 612) when he first published the *Treatise* in his late twenties. He eventually recommended against reading the original *Treatise*, advice that, fortunately, few philosophers have followed.

Politics

Hume’s politics were almost as complicated as his philosophical views and defy easy classification. He complained that, with the publication of his *History of England*, he was “assailed by one cry of reproach, disapprobation and even detestation: English, Scotch, and Irish, Whig and Tory, churchman and sectary, freethinker and religionist, united in their rage” against him for one reason or another (Hume [1776] 1980, 614). Of his political outlook in general, he said in a 1756 letter to John Clephane, “My view of things are more conformable to Whig principles; my representations of persons to Tory prejudices.” Hume had a realistic appreciation of the imperfection of societies and the limitations of human reason, which inclined him to favor moderate, pragmatic reforms and gradual, piecemeal change over political idealism and violent revolution, both of which he found temperamentally and philosophically uncongenial. He thought that rebellion was advisable only in cases of extreme tyranny or prolonged abuse. As long as customs and rulers kept the peace and did not unduly oppress or exploit their subjects, they ought to be obeyed. Such conservatism led Thomas Jefferson

to brand Hume as a Tory and ban his *History of England* from the University of Virginia (which he had founded). However, Hume was broadly supportive of the Glorious Revolution of 1688 to 1690 (and therefore no straightforward Tory) and expressed some sympathy for the American colonists in their dispute with the British Crown. He was also in favor of freedom of the press, religious toleration, and private commerce and spoke out on behalf of an extended franchise, separate and decentralized political power, and free government. Although he did not regard private property as a natural right, he defended free trade, welcomed the civilizing effects of *doux commerce* and the trade in luxury goods. His account of the “polite” culture attendant upon the progress of commercial society anticipated the central arguments of Smith’s *The Wealth of Nations*, which he praised in turn. Nonetheless Samuel Johnson hoarily dismissed Hume as a mere “Tory by chance” who “has no principle.”

Religion

Hume was a religious skeptic (a term he often applied to himself), and concluded that it was not rationally possible either to affirm or deny the existence of God with any certainty. This belief set him apart from both the deist mainstream of the Enlightenment and the more orthodox religious establishment that still dominated eighteenth-century Scotland. The Church of Scotland seriously considered bringing charges of infidelity against Hume for his heterodox religious views, costing him the academic career that he had coveted. Even so, both Hume’s atheistic sympathizers and his zealous religious opponents are wrong to have attributed atheism to him. When asked if he was an atheist, he would say that he did not have enough faith to believe that there was no God. Hume was not certain that there was no God; he just did not see a good enough reason to suppose that there was. Among the least convincing reasons for believing in God, he thought, was the so-called argument from design, which he subjected to relentless criticism in his posthumously published *Dialogues Concerning Natural Religion*, which are partially based on Cicero’s *De Natura Deorum*. He was similarly harsh in his attitude to the existence of miracles on the grounds that a miracle implies “a transgression of a law of nature by a particular volition of the Deity,” something that is a clear violation of all prior experience and therefore far less probable than alternative explanations,

such as that people lie or are deluded in their perceptions (Hume [1902] 1972, 116). Hume also denied the existence of original sin, defended the legitimacy of suicide, and argued against immortality of the soul—all positions that did little to endear him to the religiously orthodox.

Influence and Legacy

Although Hume was much better known in his own lifetime for his best-selling historical writings than for his largely overlooked philosophy, the reverse is true now. Today, his *History of England* is much less read than his philosophical works, particularly his precocious masterpiece *The Treatise of Human Nature*. He is now commonly seen as one of the most important and influential philosophers of the eighteenth century who famously woke Immanuel Kant from his dogmatic slumbers and provoked him to instigate a “Copernican revolution” in philosophy. The list of thinkers influenced by Hume’s skeptical ideas (Adam Smith, Arthur Schopenhauer, Charles Darwin, Jeremy Bentham, Alfred Ayer, Albert Einstein, and Karl Popper, to name a few) is impressive and attests to his importance in the history of Western thought.

Idealism

The era of German idealism, extending roughly from the late eighteenth to the mid-nineteenth century, stands out as one of the most profound and prolific periods of intellectual history. Colored by the disenchanting aftermath of the French Revolution on the one hand and the Enlightenment philosophy of Immanuel Kant on the other, an entire generation of German intellectuals began to articulate the deeply political implications of a “critical” philosophy that located the ultimate source of epistemic and moral authority in the concept of an autonomous, rational subject. Although the overlapping strands of Kantian and post-Kantian philosophy—systematic, romantic, speculative, and theological—varied markedly with respect to both theoretical orientation and methodology, their efforts are broadly united in an attempt to ground political reform in philosophical principles derived from human consciousness. Although many of the epistemological and metaphysical commitments grounding those efforts were already losing momentum by the 1830s, the legacy of German idealism’s unique synthesis of philosophical and political activity has had a distinct and lasting impact on radically divergent forms of Western political thought.

Kantian Idealism

Idealism, broadly construed as the philosophical doctrine that reality is ultimately mental rather than a material construct (as realism holds), had

taken many forms prior to Kant (e.g., Plato, George Berkeley, Gottfried Wilhelm Leibniz, and Christian Wolff). Kant rejected the “dogmatic” idealism of his predecessors and developed a *transcendental idealism* that sought to reconcile a mind-dependent account of experience with the empiricist philosophy of John Locke and David Hume. This shift in metaphysics—which Kant famously likens to the Copernican Revolution—explains the possibility of experience in terms of the spatial, temporal, and intuitional form that our faculties assign to sensory content. Reason can generate warranted conclusions only about things as they appear in experience but denies all knowledge of things as they are in themselves, including the will, the soul, and God. In other words, Kant divides reality between *phenomena* and *noumena*, restricting knowledge exclusively to the former.

This epistemological division in turn explains the possibility of an autonomous will. We cannot know the will, but reason can, and indeed must, posit a free will as the condition of morality. Operating outside the sphere of deterministic natural laws, the will binds itself to a universal, rational law of morality, which it gives itself in the form of a categorical imperative. Kant’s political philosophy is, accordingly, a manifestation of this central account of autonomy. Although he penned several popular essays on political matters late in his career, his legacy as a political thinker is secured in his theoretical and moral philosophy, which has had a particularly strong influence on modern political liberalism. Most notably, John Rawls’s notion of an “original position” from which to determine justice fairly and impartially, as expounded in *A Theory of Justice* (1971), is deeply and explicitly indebted to Kant’s rational procedure for determining moral duty.

If, however, we step back and trace the lineage of Kant’s philosophy through the classic triumvirate of nineteenth-century German idealists—Hegel, Fichte, and Schelling—we observe a far more complex and variegated picture of idealism’s legacy within modern political thought.

German Idealism

Fichte

The comprehensive statement of Johann Gottlieb Fichte's philosophical thought is contained in the *Wissenschaftslehre*, roughly translated as "The Science of Knowledge." Although it ranges over many philosophical topics, its overarching purpose is to solve a problem of autonomy inherited from Kant: Exactly *how* does binding oneself to a self-legislated law take place? Fichte aims to answer the question of what it means to bind oneself to a law of one's own rational making. His answer resides in the metaphysical concept of a "self-positing ego" that asserts itself as the ultimate source of freedom and normativity. The absolute and unconditioned principle of philosophy, Fichte argues, is intuited in the "I" of self-consciousness, in which any discursively self-conscious being participates, and through which all other existence is posited by negation, as "not-I." This move resolves the Kantian dilemma by grounding autonomy in the impersonal I's inherent activity. Yet it raises important difficulties regarding the normative status of *other* conscious beings. Fichte's attempt to accommodate intersubjective consciousness by describing the limits, or "checks," that the external world and other human subjects place on absolute free activity leads him to articulate the essential structures of mutual recognition that come to form the basis of Hegel's account of social freedom.

In the second part of the *Wissenschaftslehre*, "The Foundations of Natural Right," Fichte applies his notion of intersubjectivity to a theory of the state. Departing significantly from Kant, he asserts that law is in principle independent of morality, and he seeks a transcendental justification of legal right, grounded in the possibility of self-conscious agency. Many critics regard Fichte's attempt to give an a priori deduction of legal and political institutions as both conceptually and methodologically flawed. Recent scholars, however, emphasize the more pragmatic and materialist dimensions of his political thought. His account of property, for example, more closely resembles a kind of proto-Marxist socialism than the standard liberal view he is generally thought to represent. More generally, Fichte understands individual rights as the outcome of recognitive acts between free and rational beings; in other words, a particular status (e.g., property owner and citizen) is first *granted* through social relations, and only then codified into law. Natural right, therefore, consists in those conditions under

which it is possible for legal and political institutions to give rise to and embody the basic equality of intersubjective recognition.

Although recent scholarship gives a more interesting and appealing account of Fichte's thought, it has proved more difficult to ignore the pronounced nationalism and overt anti-Semitism with which it is closely connected. Indeed, his frequent reference to the virtues of "Germanness" is often cited as the intellectual origin of National Socialism.

Schelling

Following Fichte, Friedrich Wilhelm Joseph Schelling promised a more adequate foundation for, and completion of, Kant's philosophy. Originally trained in a Protestant seminary in Tübingen (where he roomed with Hegel and the poet Friedrich Hölderlin), Schelling was a precocious and productive thinker whose early published works earned him a professorship at Jena at the young age of 23. Despite a successful career, Schelling is often considered a transitional figure between the philosophies of Fichte and Hegel—a conception that scholars have only recently begun to challenge.

Schelling's philosophy defies simple characterization for several reasons. First, he adopts a difficult style of prose, which becomes increasingly opaque and metaphorical throughout his career. Second, his philosophy is a patchwork of ideas selectively chosen from Spinoza, Leibniz, Kant, and Fichte, where no single view is easily discernible. More significantly, he adopted, abandoned, and frequently rejected a range of philosophical positions over the course of his writings. Yet, throughout the many phases of his intellectual development—"philosophy of nature," "identity philosophy," "reflective philosophy," "positive philosophy," "philosophy of mythology," etcetera—Schelling maintains a foundational interest in the Kantian problem of autonomy. His early writings articulate a compatibilist account of freedom as a historical, developmental form of self-legislation. This was an important influence on the early work of Jürgen Habermas, who argues (in his doctoral dissertation) that Schelling's metaphysics prefigures the conceptual transition from idealism to materialism. Schelling's own solution to the problem of autonomy is to collapse the

distinction between “subjective” thought and “objective” nature in the notion of an unconditioned, undifferentiated, active “Absolute.” This represents a broader strategy to ground the conceptual dualisms of Kant and Fichte in the monist metaphysics of Spinoza. Unlike his idealist counterparts, however, the romantic-minded Schelling regards the nature and ultimate activity of this essential unity as accessible through nondiscursive forms of aesthetic experience.

Among the idealists, Schelling’s philosophy shows the least interest in explicitly political topics. His increasing commitment to metaphysical theology, however, lends his thought an air of conservatism that would implicate him in the reactionary politics of the Prussian government. Exploiting Schelling’s intellectual stature, King Friedrich Wilhelm IV appointed Schelling to the chair at the University of Berlin, where he was famously instructed to “stamp out the dragon seed of Hegelian pantheism.” The plan backfired: Schelling found himself lecturing to empty halls, and instead of quelling the revolutionary fervor, leftist intellectuals were further emboldened in their critique of Prussian authority. Importantly, his theology-laden rhetoric approving the state’s exploits served to remind the newly emerging school of Hegelians—including the young Karl Marx—that effective political critique would also require a thorough critique of religion.

Hegel

In many ways, Georg Wilhelm Friedrich Hegel continues what he sees as the revolutionary task inaugurated by Kant, namely, developing a rationalist political theory together with a systematic account of human freedom. In the so-called “minor” political writings, Hegel argues for the rational necessity of constitutional reform, national unity, centralized government, and a range of other historically specific topics. Similarly, his major political work of 1821, *Elements of the Philosophy of Right*, sets out to establish a rational basis for a theory of natural rights. What sets Hegel apart from the Enlightenment tradition, however, is a teleological conception of rationality and freedom as socially and historically structured.

The tripartite division of *Elements of the Philosophy of Right* reflects the dialectical-historical progression of political self-realization within distinct “spheres of right.” In “abstract right,” which Hegel identifies with the contractualist theories of Hobbes and Locke, the conception of right has only specific legal content (e.g., rights property and contract). With Kant in mind, Hegel describes “Morality” as the stage in which humans develop an appreciation for both the universal will and the moral duties implied, on the one hand, and the importance of substantive individual well-being, on the other. These opposing claims are finally reconciled in *Sittlichkeit*, or “ethical life,” in which freedom shows itself to be the rational synthesis of the individual subjective will with objective duties, both moral and political. Autonomy, in other words, is achieved only through natural social relations beginning with the family and proceeding to the higher forms of civil society and the constitutional state.

Building on Fichte’s insights regarding the recognitive structure of individual rights, Hegel argues that social freedom ultimately founds legal rights, not vice versa. Freedom, understood as the possibility for self-realization, implies a conception of the good life that is inevitably informed by a culturally and historically particular set of normative social institutions. Rights emerge within, and because of, the existing normative structures of a given way of life. The essence of the state, then, is to establish and maintain the kinds of institutions that unify the universal will with the individual wills of its citizens.

Hegel’s political philosophy has been subject to criticism from both the left and the right. Citing his advocacy of a constitutional monarchy, Hegel is frequently branded a reactionary conservative and apologist for Prussian authority. Likewise, his famously cryptic remark that “the rational is the real and the real is the rational” is often read as an implicit political quietism. On the other hand, Hegel’s conception of freedom as self-determination can strike the modern liberal as elitist and paternalistic, as Isaiah Berlin points out in “Two Concepts of Freedom.” It is important to keep in mind, however, that Hegel’s primary aim is to ground the legitimacy of any state in rational justification, which requires mutual recognition of rights instead of either an arbitrary or absolute authority or a libertarian conception of freedom as unrestrained will. Moreover, Hegel’s

emphasis on social freedom marks an important challenge to the individualist–contractualist tradition of rights—a challenge that was taken up in the aftermath of idealist philosophy and remains a powerful current in political thought.

Marx and the Frankfurt School

Shortly after Hegel’s death in 1831, Hegelian philosophy split between the conservative, theologically oriented Right Hegelians and the revolutionary, politically conscious Left Hegelians. Although a relative latecomer to the intellectual scene, the young Karl Marx energized this latter group of “Young Hegelians” with a novel (albeit highly polemical) theory of dialectical materialism that predicted the collapse of capitalism and the subsequent emergence of classless communist society as a historical necessity. Although Marx makes extensive use of Hegel’s dialectic method of critique, he is deeply critical of Hegel’s idealist philosophy. In place of the abstract, metaphysical notion of “spirit,” or *Geist*, Marx famously proposes to “set Hegel back on his feet,” to explain human activity in terms of its *material* basis, that is, through the concrete economic relations that arise from the essentially productive nature of human beings.

Inspired by Marx’s early writings, members of the Institute for Social Research, which came to prominence in Frankfurt in the 1930s, developed a “critical theory” that aimed not only at an explanation but also at the *emancipation* of modern capitalist society. Although they by no means spoke with a collective voice, the theorists of the “Frankfurt school,” including Max Horkheimer, Theodor Adorno, Herbert Marcuse, and György Lukács, were engaged in a two-part strategy: to purge idealist metaphysics of theology, on the one hand, and on the other, to salvage the idealist claim that experience is historically and theoretically structured. This undertaking, they believed, would facilitate the union of theory and praxis absent in traditional theory. Its efforts were largely thwarted, however, by the rise of National Socialism, which forced many of its members into exile.

During the postwar period when “second-generation” critical theory arose, Jürgen Habermas assumed directorship of the Institute. Habermas’s early

political work combines the Marxist critique of political economy with pragmatist philosophy to formulate the concept of a “public sphere” where genuinely democratic social discourse could take place. Already, this optimism for nonideological communicative practices marks an important shift away from the more skeptical orientation of early critical theorists. In his later writings, Habermas goes further: He appeals to an Enlightenment-derived universal normative standard of an “ideal speech situation” in which members achieve political consensus. For many, though, this move from the historicist, contextualist rationality of Hegel to the transcendent, universalist rationality of Kant betrays the critical epistemological foundations of earlier Frankfurt school theorists.

Meanwhile, Axel Honneth, who has led the Institute since 2001, has made great strides in bringing Hegel back into the fold of mainstream social and political theory. In his most influential work, *The Struggle for Recognition*, Honneth integrates an in-depth analysis of the early Hegel’s account of the “master/slave” dialectic with the empirical psychology of George Herbert Mead to construct a critical theory of social conflict. Taking various experiences of disrespect and political disenfranchisement as a starting point, Honneth articulates the “moral grammar” of an inherently human interest in mutual recognition in the often conflicting spheres of emotional love, political rights, and the development of individual talents and capacities.

Theories of recognition have since merged with a broader consortium of political thinkers from the postmodernist, feminist, and multiculturalist traditions. Although this development has yielded a fruitful and relevant exchange among major contemporary intellectuals, including Charles Taylor, Nancy Fraser, and Kwame Anthony Appiah, other critics question whether Hegel’s account of recognition offers a viable principle of social normativity. It is not clear, for example, that every instance of social conflict can be diagnosed as a failure of recognition. As Raymond Geuss argues, a suicide bombing hardly results only from an act of *misrecognition*. Furthermore, a politics of recognition seems to risk essentializing or oversimplifying complex forms of subjectivity *to be recognized*; to recognize, for example, “the plight of homosexuals” can result in an equally alienating identity concept.

Ideology

An ideology is a set of ideas, beliefs, and values that aim at defending, changing, or criticizing the social arrangements of a society and its public policy plans. It does so by controlling public conceptions of social and political life and by generating public decisions for a collectivity. Those are, however, necessary but insufficient characterizations of ideology, which is both one of the most disputed and most important political concepts. It is suspended in particular between two semantic families. The one evaluates ideology as a pejorative phenomenon, an illusory and distorted way of processing social reality. On that view, ideology is either eliminable or is an unfortunate outcome of the human desire to dominate social thinking in order to assert class or institutional power over others. The other view offers an interpretative analysis of its features as an indispensable and central dimension of all political thinking, and one that is to be found in many variants.

Origins of the Term's Varied Meanings

The term *ideology* was coined by Antoine Destutt de Tracy at the end of the eighteenth century to refer to the scientific investigation of ideas, although it has since shifted to denoting those ideas themselves. Its introduction as a major analytical tool by Karl Marx and Friedrich Engels established its derogatory signification on the epistemological level as an abstract inversion of reality and truth. They also associated ideology and class: The

alienated existence of human beings under capitalism formed partial thoughts that reflected the material power of the bourgeoisie and its relations of production. The power of ideology was augmented because its distortions were presented as normal features of socioeconomic life—an early recognition of the tendency of many ideologies to naturalize their preferences. Once those defects of social life would be removed, however, ideology would disappear and truth would reemerge. As the task of theory was to unmask, Marxist analysts originally showed little interest in the details of the distortion they wished to eradicate; hence, they referred to ideology in the singular.

The abstraction and distortion located in the Marxist conception of ideology were joined by another derogatory tendency: Under the impact of the interwar rise of communism and fascism, ideologies were now understood as titanic ideational weapons that attempted to pervade all walks of life in a unitary vision, and that were often in a state of violent confrontation. The semantic field thus thickened, associating ideology with dissimulation, oppression, ephemerality, totalism, and a high degree of abstraction, features that are still attributed to ideology in current vernacular usages. In addition, the mode of ideological expression was regarded as manipulative not only through a selective approach to facts but also through a direct appeal to emotion. That could occur both by means of rousing or subtle rhetoric and through visual means, one powerful instance being the Nazi Nuremberg rallies in the 1930s.

The next stage in evolving interpretations of ideology was linked to the important theoretical innovations of Karl Mannheim (1893–1947). Mannheim accepted the social rootedness of ideology, but he recognized its multiplicity of forms. He also drew attention both to its manipulative and its unconscious manifestations, and he distinguished between a particular and a total conception of ideology. The first, on the psychological level, included deceptions and lies. The second constituted a complete *Weltanschauung* adopted by a group that reflected the broad field of ideas prevailing in a given historical epoch. But Mannheim persisted in the unusual restriction of ideology to conservative and traditional social thought, while reserving the term *utopia* to what might now be regarded as progressive or transformative ideologies. Although Mannheim was crucial in advancing ideology as a

phenomenon that had to be taken seriously, ultimately he too continued to regard it in a normatively skeptical manner, suggesting that the intelligentsia—those able to cut loose from their socially conditioned thinking—could free-float among different ideological positions. In developing a perspective capable of transcending ideological determinism and offering a unified sociology of knowledge, they could return to some notion of social truth. What is often referred to as “Mannheim’s paradox”—that in exposing a view as ideological, we too offer an ideological view of the world—could thus seemingly be resolved.
